Various stories have been afloat here concerning the status of the Calumet & Corbin Mining Co., stock of which has been manipulated on the Curb heavily for the past three months. In November 1913 the Company acquired under option the New Era gold mine in the Freeland district, Colorado, near Idaho Springs. An official notice was sent out then stating that this property had been "purchased and taken over," but the facts seem at variance with that statement. It seems the New Era was acquired under option for $150,000, with $10,000 paid down and $7500 payable every six months until the property was paid for. Last year a $7500 payment was defaulted, and it is stated that there are about $10,000 local debts unpaid. The property thus passed out of the hands of Calumet & Corbin, although sponsors for the stock here on the Curb protested that such was not the fact. It was naively stated that the option had not necessarily been parted with, and the Company could, if it so desired, exercise it still, but had decided not to do so, and was looking up a property in Alaska instead to purchase. In the search for the Senegambian ensconced in the woodpile it appears that there has been a period in which Calumet & Corbin's hold upon anything in the shape of a mining property was, to say the least, very slender, although there has been nothing at any time to indicate any suspended animation in the stock's activity on the Curb.

Philadelphia capitalists have recently formed, under the laws of Delaware, a corporation called the Colorado Minerals Separation Co., with a capitalization of $500,000, and announce that they will build and install a battery of 20 machines to operate on the dump material at Leadville, Colorado. It is claimed that a recovery of 97 to 98% in zinc concentrate can be made through these machines by a mechanical and electrical process. Boston experts not connected with the Company in any way have testified to the efficiency of the machines, several of which have been built and tried out, with a capacity of treating six tons of ore per day.

BUTTE, MONTANA

PRICE OF SPELTER AND BUTTE'S ZINC DEPOSITS.—COPPER FROM BUTTE TO NEW YORK *via* PANAMA.—EAST BUTTE AND NORTH BUTTE CONSOLIDATION.—MONTANA BRANCH OF A. I. M. E. —BARNES-KING DIVIDEND PROBABLE.

The present high price of spelter is causing Butte's two productive zinc mines to operate at their maximum capacity. There is no curtailment or working part time here. The only limitation placed on the mines is the tonnage capacity of the mills. The manifest success and prosperity of these mines has resulted in mining men considering the opening of other zinc orebodies in the district. The great detriment up to the present has been the fact that so much of the zinc ore is burdened with large quantities of pyrite which has not been successfully eliminated so far by any known process of concentration. Many attempts have been made in the past to make a satisfactory zinc product from the ores of the Lexington and Alice mines. At present the Anaconda company is said to be making experiments with the hope of devising a process of treating these iron-zinc ores. Should these tests be successful, a great impetus will be given the Butte district. It is not unreasonable to predict that before many years this centre will be producing as many pounds of commercial zinc as of copper.

A large expense in connection with getting Butte's copper product to market has been the railroad freight on bars to New York. Arrangements have now been made to reduce this freight cost by shipping the copper over the Chicago, Milwaukee & St. Paul railway to Tacoma, Washington, where it will be loaded on steamers and carried direct to New York by way of the Panama canal. Now that the Anaconda company is arranging to have most of its copper refining done at Great Falls, rather than on the Atlantic coast, the amount of copper which will be shipped by this route to New York will be large. Theoretically it might seem that the additional length of time for delivery would mean a considerable interest loss on refined copper tied up in transit, but practically a company like the Anaconda usually has a considerable store of copper on hand, and it might as well be stored in transit as in warehouses at the selling point.

The mines of the East Butte reduction works have been closed since August 5, and, according to the management, there is no likelihood of the property being reopened in the near future or at least not until the copper market is considerably more stable than it seems to be at present. The Company is making good use of the shut-down in carrying out extensive changes and repairs at its metallurgical plant, and also in doing development and making repairs at its mines.

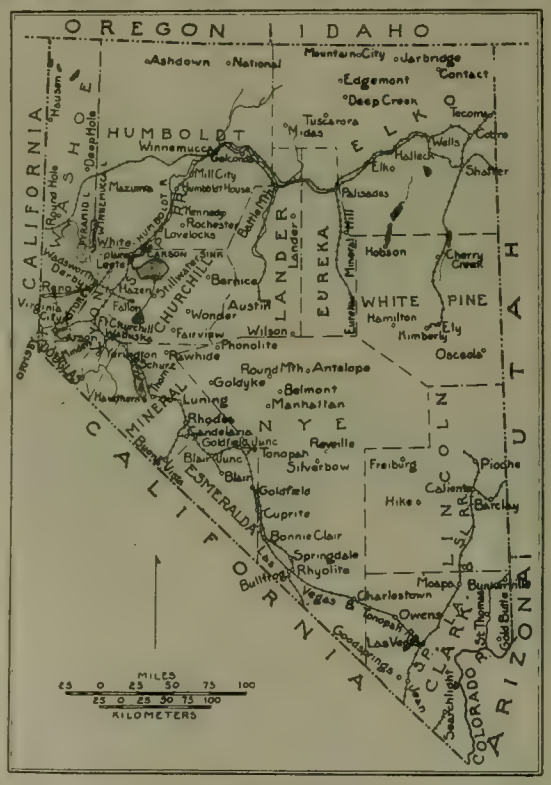
The rumor ceases to be downed that the North Butte is considering a business consolidation with the East Butte Mining Co. If this consolidation could be worked out on a basis satisfactory to the interests of each company, it would undoubtedly be of value in operation of the properties. There is no question but what the North Butte is considering seriously the matter of providing some treatment method for its ores other than the present one of shipping to the Washoe reduction works of the Anaconda company. The North Butte apparently considers that it should be able to treat its own ores at less cost than that charged it by the Anaconda. In this connection the fact has recently come to light that the North Butte company has bought some land and water rights near Silver Bow, six miles west of Butte. These water rights could supply sufficient water for concentrating at least 1000 tons of ore per day.

The Barnes-King Development Co. is nearly ready to surprise its stockholders by considering the question of dividends. This concern is one that the mining engineering profession can point to with considerable pride. As the Company was originally launched by its promoters it was a notorious affair, and the original investors lost heavily; but after the collapse, a few of the braver stockholders, among whom were some experienced mining men of Butte, got together and made an inventory of the assets of the Company. They found as its most important asset about $250,000 in cash. Instead of rushing madly into some other mining venture with this money, they put it out at interest and used the interest in a careful, systematic, and conservative search for a suitable mining investment for it. This search covered several years, and was finally rewarded in the securing of a property which has netted over $200,000 during the past year, and in the securing of another property, the development of which has proved very encouraging. This second property promises to be in the dividend class within a year. The Barnes-King shares, which were originally unloaded on the public at the ridiculous price of $5, dropped during the time of storm to below 50c. per share. Under conservative management, the property has been brought to its present promising stage, and the stock is now selling at close to $2 per share, and the prospects of the Company seem to fully warrant this price.

RENO, NEVADA

NEVADA WELFARE AND DEVELOPMENT CONFERENCE.—NOTES ON PAPERS AND DISCUSSIONS OF INTEREST TO MINERS AND ENGINEERS.

A largely attended and interesting conference was held under the auspices of the University of Nevada and state government at Reno on February 5 and 6. The meeting was



MAP OF NEVADA.

attended by mining men, engineers, railroad officials, farmers, and business men from the whole state, and many from California. In addition, the State Legislature adjourned and attended the conference. The meetings were held in the University buildings, the conference being called by A. W. Hendrick, president of the institution, who was ably assisted in

his work by James G. Scrugham, dean of the engineering departments.

One of the most valuable and interesting meetings of the conference was that of Friday morning, the 5th. This session was opened with a paper by Maxwell Adams of the University, on 'The Manufacture of Nitrates by Electrical Methods.' He discussed the history of plants in this country and abroad which produce nitrates by the atmospheric fixation method, and called attention to the great possibilities in Nevada for the manufacture of nitrates with the aid of electrical power from water-power plants. This paper was followed by several on irrigation pumping, the titles and authors being as follows: 'Electric Irrigation Pumping,' by H. A. Lemmon, of the Truckee River General Electric Co.; 'Irrigation Pumping in Central Nevada,' by James Edmunds, of Winnemucca; 'Irrigation Pumping Opportunities in Elko County,' by B. G. McBride, manager of the Elko Lamoille Power Co.; 'Development of Underground Water Supplies in Southern Nevada,' by Hon. Peter Buol, senator from Clark county; and 'Costs of Electrical Irrigation Pumping,' by F. B. Mechling, manager of the Nevada-California Power Co. There was also a formal discussion by L. W. Crehore, city engineer of Fallon. Each of these papers pointed out different conditions and problems which have to be considered and solved in various parts of the state in connection with irrigation pumping. One of the most striking points brought out was the diversity of conditions. In Washoe county considerable difficulty is found in sinking the wells, to prevent them from caving; near Winnemucca the gravel formation makes well-sinking an easier problem; in Elko county conditions are ideal for electric pumping; while in southern Nevada the artesian belt renders it unnecessary to use pumps.

On Friday afternoon the conference meeting was devoted to a series of papers on the safety movement and welfare work throughout the state, the session constituting an interesting continuation of the 'Safety First' work started at the University of Nevada in January 1914. One of the subjects under discussion was 'Electric Headlights,' by Mr. Booth, attorney for the Southern Pacific, and Frank Ingram, president of the Brotherhood of Locomotive Firemen and Engineers, in which it was brought out that the nitrogen lamp, which was tested a year ago, has now proved generally satisfactory and meets the requirements of the employees as well as the railroad company.

Other interesting papers read during the conference were the following: 'Reclamation Problems,' by E. P. Hobson, of the U. S. Reclamation Service, and discussion by E. P. Osgood, of this department; 'The Adjudication of Water Rights,' by William Kearney, state engineer; 'The Commission Form of Government,' by C. L. Harwood; and 'The Control of Public Utilities,' by W. H. Simmons, state railroad commissioner; also an interesting and valuable discussion on the subject of 'Rural Credits,' by Dean Hunt, of the Agricultural Department of the University of California; Frank Drum, president of the San Francisco Savings Union Bank & Trust Co.; and Wm. Sproule, president of the Southern Pacific Company.

The conference closed with a banquet to 400 guests in the gymnasium of the University on Saturday evening, at which the president of the University presided, the guests including governor E. D. Noyle, the members of the Legislature, state officials, and the delegates to the conference.

Safety First of the Nevada Consolidated company for January states that at Copper Flat there was only one accident resulting in a loss of time, two at the concentrator, and one at the smelter.

This monthly publication has started its third year, and the Company has hopes of increasing its usefulness. It was one of the first magazines of its kind in the field to "herald the slogan and champion the cause of industrial safety," and it has persevered in its policy of publicity, in calling the attention of foremen and employees to the number, nature, cause, and effects of works accidents.

LEADVILLE, COLORADO

Important Gold Discoveries in Three Mines — Leadville Mill Busy — Down Town and Big Five Companies — Zinc Producers.

The past month has brought to the front several features in the mining activities of the district which have aroused great interest throughout the state. Three important discoveries of high-grade ore were made soon after one another. The first was made in the Garbutt property, adjoining the famous Little Jonny on Jonny hill. John Cortellini, who operates the Garbutt, has a lease on a great number of Ibex blocks along the boundary, and on several claims to the south which have not been prospected at all. A large vein was cut in the ground leased from the Ibex late last year, and shipping has been carried on steadily from the orebody here uncovered. This discovery led to development from the Garbutt side, and the same vein has been found in that property and continues into the Nonie claim to the south. Taking the development as a whole, it is the largest orebody that has been opened in this district in many years, and is the source of one of Leadville's greatest productions. The ore will average about 2 oz. gold per ton, and contains little other value.

The Gordon-Tiger property, in the Twin Lakes district, was the scene of the second excitement. This old property has been one of the greatest gold producers and has been idle for years. Recently George W. Boyce took charge of the mine, and under his management another of the old-time shoots of 'picture rock' has been opened, which assays between $200 and $300 per ton. The exact size of the deposit has not been ascertained, but a good number of men are employed sacking the ore, which is being held for shipment as soon as the roads permit.

Mining circles throughout the state received a happy surprise early this month when it was made known that George Campion, a brother of John F. Campion, owner of the Ibex property, had cut a body of rich ore in the Little Bob mine, which adjoins the Ibex on the northern brow of Breece hill. Mr. Campion has operated this property several different times, and on each occasion failed to open anything that was profitable. Undismayed by past reverses, he interested a number of Colorado Springs capitalists in another attempt to prospect for rich deposits which he felt sure existed in the formations. After several weeks of fruitless searching, ore was found and proved up to the expectations of the promoter. A large vein of ore running from $320 to over $500 per ton has been opened, and preparations are now being made to drive under the ore and mine it through a rise. This property will soon be added to the list of money makers that have been recovered out of what were considered 'gutted' properties.

The old Leadville district mill is again operating successfully. A new oil-flotation process has been installed in the old plant, and has been found to treat the low-grade ores with good results. Samples from several of the properties have been tested, and a number of the low-grade properties are preparing to resume work as a result. Horrigan Bros. closed a contract with the milling company to ship the immense tonnage of tailing from the old Adams mill in Stray Horse. The deposit has been carefully sampled, and it is estimated that there is $60,000 worth of ore in the dam. Shipment of this material will start at once.

The Down Town Pumping Co. is going steadily ahead with the work at the Penrose. Jesse F. McDonald, manager, stated recently that he had received word from the Providence Machine Manufacturing Co. stating that the pumps were shipped on February 4. They are expected to arrive any day now, and they will be installed immediately upon arrival.

The Big Five Operating Co., which has been successfully

working the Big Four property on Breece hill for some time, has decided to rebuild the surface plant which was destroyed by fire several weeks ago. The Company is planning an extensive campaign on the Big Four, Gold Basin, and 25 blocks of ground leased from the Ibex Mining Co. adjoining. A lateral will be driven from the Yak tunnel through this Ibex ground to the Big Four shaft, and rise connection made with the bottom of the shaft. This work will open a territory 1060 ft. long and at a depth that heretofore has not been reached in this district. The Big Four property, up to the time of the fire, was one of the biggest producers in the Evans district, and now that the work will be taken up on a large scale, greater results are expected. The same Company will also operate the Fanny Rawlins mine, which has been idle for some time.

The greatest tone of Leadville's prosperity at this time comes from its zinc production. In the Wolftone mine of the Western Mining Co., Leadville has one of the greatest producers of zinc carbonate in the world. With the metal market offering over 8c. for spelter, this mine is making a fine output of 500 tons per day. Several other properties are producing a heavy tonnage of zinc, among them being the Yak tunnel, Iron-Silver Mining Co., Colonel Sellers, and Dome. Predictions that zinc will go to 10c. has caused a great revival of prospecting for this valuable ore, and several smaller properties, supposedly in the zinc belt, have resumed operations, but as yet no discoveries have been made.

KALGOORLIE, WESTERN AUSTRALIA

Great Fingall New Shoot.—Chaffers' Fiasco.—Yuanmi Company's New Property.—Zinc Shavings Manufacture.—Great Boulder Developments.

Since the Great Fingall mill at Day Dawn started treating ore from the new shoot below No. 14 level, in June 1914, 28,800 tons has yielded $228,100, or nearly $8 per ton, resulting in a loss of $25,800. Owing to the extra handling required, costs totaled $7, or nearly double what they used to be. The Company has, during the year, examined under option several properties in various parts of the Murchison field, but has abandoned them all. Recently the manager staked out a block of 450 acres at Rothsay, 100 miles southwest of the Great Fingall mine. This ground was abandoned by an English company nearly 20 years ago, and was taken up by the Great Boulder company 18 months ago, and abandoned after a short examination. The district has never been properly prospected, though it has produced $70,000 from 8900 tons of ore from shallow ground.

After erecting a new plant, and spending $380,000 since the last reconstruction of the Company in July 1913, the Chaffers mine has been closed down, and all employees paid off. The new cash capital found by shareholders amounted to $230,000, while $50,000 came from gold won, and $100,000 is due to creditors. In spite of being told by John Morgan, late manager of the South Kalgurli, and who examined the property, that there were no inducements to spend money above the 2260-ft. level, and that deeper sinking to try to catch the continuation of the rich shoots being worked in the Great Boulder and Golden Horse-Shoe was advisable, the money was wasted at No. 15, 16, and 17 levels. One ore-shoot, at No. 16 level, in No. 3 west branch lode, was stated by Boyd Aarons, the manager, to average $25.80 per ton for a width of 7 ft. It now appears this was incorrect. The 6000 tons of ore raised during development was valued at $9.60 per ton, but, when treated, yielded $4.30 only. Nothing is known as to what will be done with the mine or what the creditors will receive. Six weeks' wages are due the office staff and miners, and as the mortgagees have foreclosed on the mine and machinery, the men's chances of being paid are not bright. *The Kalgoorlie Miner* has been quite outspoken on the debacle.

An option, on behalf of the Yuanmi company, over the group of claims, consisting of 136 acres, known as the Warriedars in the Yalgoo district, has been taken by Bewick, Moreing & Co. There is a regular network of veins in the property, the main bodies running north and south, being crossed by smaller leaders striking east and west. The firm's manager, G. C. Klug, states that pan prospects made by him gave high results from the surface ore. H. P. Woodward, a government geologist, whose opinion carries considerable weight, thinks that the gold will not be found at depth. However, as the terms of purchase are reasonable, Mr. Klug thought it safe to recommend the property to the directors of the Yuanmi company.

The Broken Hill Proprietary Co., which has taken over the Hoskins foundry at Lithgow, New South Wales, has been experimenting with rolling zinc sheets for making zinc shaving for cyanide precipitation. This has proved to be a success, and the Company expects shortly to be in a position to supply the demand of all the mines in Australia. The Zinc Corporation has also been experimenting for the same purpose.

The eastern area of the Great Boulder leases is at present being tested from the Perseverance workings. At depth of 1300 ft. a horizontal bore, at 4 ft. inside the Great Boulder, passed through 12 in. of mineralized greenstone assaying $18.36 per ton. At 78½ to 85½ ft. a lode 7 ft. wide, worth $10.20 per ton, was passed through, and at 117 to 124 ft. another lode assaying $11.22 was penetrated. A second bore passed through a lode 30 in. wide assaying $24.48, a distance of 163 ft. inside the Great Boulder boundary, some 500 ft. south of the previous bore. In 1910 a borehole at 1800 ft. passed through a lode 147 ft. west of the Perseverance boundary, assaying $8.64 over a width of 4 ft. Diamond drilling is still proceeding.

The *Monthly Journal* of the Chamber of Mines for November contains an article on 'The Importance of Efficiency in Mine Sampling,' by Leslie B. Williams. He says, "if sampling results are looked on as approximations only, their value is great. * * * No hard and fast rule can be set down for the amount of sampling to be done." This publication also contains some interesting notes on a new industry in Australia resulting from the war, the rolling of zinc sheets suitable for cutting into shaving for cyanide plants.

NEW YORK

Institute Meeting Well Attended.—Amendments Carried.—New Officers Elected.—Butte.—Duluth and Inspiration.

(By telegraph.)—The attendance at the meeting of the American Institute of Mining Engineers this week numbered about 300. The sessions were quiet but much good fellowship prevailed, and it was evident that members are beginning to feel better acquainted with each other. The sessions devoted to safety and to speculation brought out lively discussions which will be reported later. There was much interest in the announcement of the vote on the amendments to the constitution. All those proposed carried by good majorities. For the two removing restrictions to expressions of opinion by the Institute, the votes were: No. 2, 822 for, 250 against; No. 3, 844 for, 237 against. The regular ticket for officers was duly elected, the vote being: W. L. Saunders, president, 1118; vice-presidents, S. J. Jennings, 1124, and P. N. Moore, 1114; directors, S. A. Taylor, 1120, R. W. Hunt, 1129, Hennen Jennings, 1123, George C. Stone, 1123, and W. H. Aldridge, 1126.

The Anaconda company will exercise its option on the Butte-Duluth Copper Co.'s mine and mill, paying $1,500,000 cash and a share arrangement. Diamond drilling to 160 ft. shows 1.8% copper ore. An immense tonnage of ore amenable to leaching is opened.

The Inspiration Consolidated Copper Co.'s balance sheet on November 30, 1914, showed assets consisting of material and supplies, $581,433, and cash and current assets, $3,064,377; while current liabilities were $244,482.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

Cordova

The mine inspector for the second and fourth judicial divisions of Alaska, W. J. Maloney, arrived in Cordova at the end of January, having covered the 307 miles between Fairbanks and Chitina in 5½ days by a dog-team with 10 in harness. In one day he covered 76 miles in nine hours, with one passenger and 300 lb. of freight. These animals were left at Chitina, but they will be returned to Nome later on to enter the All-Alaska Sweepstakes race. In a race at Nome, about the beginning of the year, 17 teams participated, the inspector's team broke trail and covered 2½ miles in 17 minutes and 40 seconds in a heavy storm, finishing third. The three teams with the best time had the advantage of the broken trail.

A DOG-TEAM ON THE MARCH.

A Keystone drill and Ingersoll-Rand air-compressor, three machine-drills, and a jackhamer are to be installed at the Valdez Creek Placer Mines property. A 58-hp. Pelton wheel will drive the plant. These drills are necessary to break up boulders encountered in sluicing. The Keystone machine is for prospecting. Hydraulicking is expected to start early in May, giving four full months' run before cleaning up. The output should be over $200,000, according to the president, George W. Sias. A. H. Bryant is superintendent, and W. T. Soule, transport manager. During 1914 and 1915 a total of $228,044 was spent on property purchase, development, and equipment. Cash at Cordova on January 30 was $15,000.

Fairbanks

The mine inspector for the second and fourth judicial divisions of Alaska, W. J. Maloney, arrived in Fairbanks early in January after a tour of several districts. He stated that in the lower river there is some activity all along the Yukon and Tanana, but conditions are far from booming. At Nome, from where the inspector started, there is more prospecting this winter than for several years. Ruby is also active, and on Long creek three big 'outfits' are in operation. On Mascot creek, Deitz, Sech, and Walker have very rich gravel. The district's output for the past season is estimated at $780,000. A little work is under way in the Hot Springs district, and the yield was about $675,000. The trail from Nome to Ruby was bad, but on to Fairbanks it was good. At No. 4 Below Goldstream, Gleason and Sawyer have 20,000 ft. of bedrock blocked out. They have installed a gasoline engine and hoist underground, and by an automatic arrangement need no man on top of the shaft for dumping.

Iditarod

Mail to Iditarod is badly arranged, and between October 1 and November 25 there was nothing received. Sending it by way of Seward works badly, and the route from Fairbanks is preferred. Ophir is worse off, as it has had no mail since the latter part of last summer, the sacks being at Tacotna. Lower river points are in a like condition, and everybody is dissatisfied with the service, or, to quote the *Fairbanks Weekly Times*, "Iditarod is up in the air over the mail service."

Ruby

Wolf, Zuber & Shropshire, mining on Poorman creek, tributary to the north fork of the Innoko river, employed six men during the summer. The claim is known as the Poorman bench. Coyle Brothers & O'Donnell have a plant ready on their bench holdings and plan to spend the winter prospecting. Nelson & Co., also prospecting, are said to have uncovered 'pay' running $1.50 per square foot of bedrock. McLeod & Co. made several clean-ups late in the summer, soon after they started operations. The first one yielded $1200 for four men's work in six days.

Flat creek is a tributary of Timber creek, which, in turn, flows into the Poorman. T. Tousley and E. G. Morton found 'pay' reported to average $3 per square foot, but have not defined the streak as yet. D. A. Sutherland and George Roberts, working on the upper end of Flat creek, is said to have made a good discovery under the creek bed. G. W. Herman is working in good ground on Duncan creek, a tributary to Poorman. George Beetle is prospecting on Poorman.

Pahlke, Trafolet & Co., recently made a new find of 'pay' on Birch creek, tributary to Flint. They have three feet of pay-gravel 90 ft. wide, and said to average $1.40 per square foot. Charles Strite is prospecting below them on his own holdings, looking for a continuation of the same streak.

RUBY DREDGE.

ARIZONA

Cochise County

The Shattuck Arizona Copper Co.'s total revenue in 1914 was $1,660,573. The net profit was $587,497, of which $525,000

was paid in dividends, leaving a surplus of $62,497. Ore shipments were stopped on October 23 on account of the copper market. Cash and metal on hand is valued at $1,045,315.

GILA COUNTY

There has been further heavy rain in the Globe district, and instead of pumping 3,500,000 gal., the Old Dominion mine is yielding 9,000,000 gal. per day, but the pumps are not yet at capacity.

The Old Dominion output in January was 1,745,000 lb. of copper, compared with 2,797,000 lb. in that month of 1914.

GREENLEE COUNTY

The Arizona, Detroit, and Shannon copper companies have adopted a sliding scale for wages, and an increase was posted on February 6.

MOHAVE COUNTY

The Lexington-Arizona company, of Oatman, is to sink a shaft to 600 ft.——The Oatman Gold Mining & Milling Co. is to sink to 500 ft.——A good tonnage of ore has been developed in the Copper Giant property.——Considerable work is being done by the Arizona Venture Corporation in the Big Sandy district.——Molybdenite ore sent by R. C. Jacobson to the Henry E. Wood company, of Denver, returned 18% metal. Other claims in the district are forwarding similar ore to Denver.

PINAL COUNTY

The Ray Consolidated Copper Co. reports as follows for the last quarter of 1914. Floods interfered with work in December. Development totaled 3288 ft. Mining cost 49.722c. per ton. The mill treated 402,917 tons of ore averaging 1.74% copper, with 68.2% recovery, at a cost of 54.56c. per ton, an increase of 8.71c. The concentrate yielded 9,638,586 lb. of metal, against 12,636,185 lb. in the third term. The year's output was 59,044,700 lb. Net costs, including credits, totaled 8.645c. per pound, a reduction of 0.093c. After paying bond interest the surplus was $174,945.

A good deposit of zinc ore has been developed at 300 ft. in the old Reward mine, 27 miles southwest of Casa Grande, according to V. H. Brooks. Shipments are to be made when the roads are passable.

ARKANSAS

BOONE COUNTY

During January four cars of zinc ore was shipped from Zinc. On account of the price of spelter, every effort is being made to produce ore, and several old properties will be restarted. One of the most important of these is the Madison.

CALIFORNIA

AMADOR COUNTY

Many people have tried to secure options on the old Eureka mine, at Sutter Creek, owned by Hetty Green and her son, without success, but it is now reported that a Scotch syndicate has made an offer for the purchase of the property.

CALAVERAS COUNTY

Thirty-five suits have been filed in the court at San Francisco by farmers and orchardists against the Penn Mining Co., operating a smelter near Campo Seco on the Mokelumne river. The total damages asked are about $350,000, the plaintiffs alleging that fume had damaged their properties.

KERN COUNTY

A good shoot of tungsten ore has been opened in the Stringer district, near Atolia, by D. E. Thompson.

NEVADA COUNTY

San Francisco people have acquired the Montana and other claims in the Willow Valley district. This property is opened to 830 ft. on the incline, has a good past record, and is equipped with a 5-stamp mill, compressor, and other plant. R. R. Moore is in charge.

PLACER COUNTY

Development in the Glover and Hanniman mines, near Auburn, continues satisfactory.——The Little Valley gold mine, at Brandon station, was sold at the Placerville court-house last week, for $338.

SHASTA COUNTY

The Noble electric smelter at Heroult is to resume production of ferromanganese in March. The Thomas mine in Mendocino county will supply manganese ore.—Forty-four asbestos claims of E. H. Hayden, on Mears creek, west of Sims, have been sold to H. L. Smith.

SIERRA COUNTY

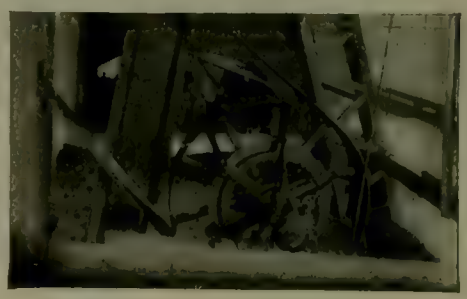
Bad weather in this county has interfered with mining, but the rain and snow insure plenty of water for the coming season.——At the Lightner, near Alleghany, sinking is still under way.——A stamp-mill may be erected on the Rainbow.——The Plumbago mill is crushing ore.——Several promising discoveries have been made in other mines.

TRINITY COUNTY

About a half-mile of flume of the Lagrange company was carried away in a recent storm, and no water will be available for two weeks for sluicing. Last year a siphon collapsed and curtailed work.

YUBA COUNTY

A dredge costing $25,000 is to be constructed for James M. McIntyre, of Sacramento, to be placed on Bulls bar near Copley, on the Sacramento river. P. Lockhart will be in charge of the boat.



SCREEN DRIVE YUBA NO. 14 DREDGE.

The man who attempted to hold up one of the Yuba Consolidated dredges last November was sentenced to five years' imprisonment recently.

COLORADO

LAKE COUNTY (LEADVILLE)

Work at the Penrose shaft of the Down Town pumping scheme is making fair progress. Nothing is known of the whereabouts of the pumps from the Providence Machine Manufacturing Co.——The Star Consolidated, on Carbonate hill, has contracted for the supply of a large tonnage of manganese ore.——To drain the Big Four mine, it is proposed to make connection between the shaft and the Yak tunnel, by driving a cross-cut and then rising to the shaft.

SAN JUAN COUNTY

Silverton and other Colorado people favor the erection of one of the United States government mining experiment stations in that town. They argue that Silverton is in the centre of the San Juan region of over 3000 square miles, producing a variety of ores, and supplied with water, electric power, coal, and railroads.

San Miguel County

The Tomboy mill treated 12,585 tons of ore in January, yielding bullion worth $41,000 and concentrate valued at $48,500. The net profit was $28,000.

Teller County (Cripple Creek)

The Cresson has shipped a car of ore worth $60,000.——Lessees in the C. K. & N. mine are working a new phonolite dike, which is about 20 ft. wide. In it are streaks of rich ore. ——The Golden Cycle company has acquired the Keener company's property of 30 acres adjoining the Elkton for $100,000, and 700 acres of coal land near Colorado Springs for $50,000.

IDAHO

Shoshone County (Coeur d'Alene)

Underground haulage by storage-battery locomotives in the Bunker Hill & Sullivan is discussed by J. W. Gwinn, of Kellogg, in the *Transactions* of the A. I. M. E., February meeting at New York. There is a total of 35,000 ft. of drifts, adits, and cross-cuts where the locomotives are used, the Kellogg tunnel being 10,000 ft. long from the portal to the main working shaft, and then about 4500 ft. farther in each of two directions.

Logging operations along the North Fork river this season have reached large proportions, and the cut is estimated at about 40,000,000 ft. The Pine Creek cut will add to this total, but work has been slack there. From 800 to 1000 men have been employed this winter. The lumber industry in the Coeur d'Alene is of great importance, yet many do not realize it.

Butte people, headed by W. H. Nichols, have taken an option on the Keating lead-silver claims at Wardner, and have organized the East Caledonia Mines Co. to develop the property. ——The Golden Curry has a shaft 416 ft. deep, equipped with a hoist, compressor, and other plant. The shaft is to be unwatered for a start.

MICHIGAN

Houghton County (The Copper Country)

Wages at the Centennial and Osceola mines have been raised to the rate prevailing on September 1, 1914. Other companies are said to be about to follow suit.

Two more companies, the Wolverine and Mohawk, have increased wages to the old scale. Miners using Leyner drills will get not less than $2.75 per shift, and other underground employees will receive a 5% advance. The Wolverine is producing 33,000 tons of 'rock' per month.

MISSOURI

Jasper County

The Texas Mining Co., three miles northwest of Joplin, will probably rebuild its mill which was destroyed by fire early in February. A new shaft has been sunk through hard limestone and a southerly drift was nearing the old workings where zinc ore had been encountered. The need of a new shaft was caused by poor ventilation.

The Fortune Teller Mining Co.'s plant of 150-ton capacity at Granby was destroyed by fire the latter part of January. The Company was working in an extensive body of blende and calamine. The plant will probably be rebuilt. Another mining plant that burned was that of the Weaver Mining Co., four miles north of Carl Junction, Missouri.

The Red Top Mining Co., at Webb City, operated by T. C. Coyne & Co., has opened rich lead ore, but is forced to timber its ground every inch of the way. A novel method of timbering is being tried, drill holes being sunk from the surface to the roof of the drift and iron rods being run through them. To the bottom of the rods are fixed the supporting timbers, while the rods are held securely on the surface by heavy beams.

MONTANA

Cascade County

Construction is to start at Great Falls on a 125 by 200 ft. furnace building, and a 25 by 300 ft. electrolytic refinery of steel, concrete, and brick, for the Anaconda company.

Granite County

A number of properties in this county are showing improvement, according to W. W. Williams, who recently visited Butte. At the Mandarin the shaft is down below 100 ft. on a silver-bearing vein. A gasoline hoist is used in this work. An electric motor will be put in later when the power-line is completed from Philipsburg.

Madison County

The mining camps of Bear gulch, Goodrich gulch, Rochester, and Silver Star have one or more mines shipping ore, and developments are considered encouraging for employment of more men and machinery. The crushing plant of the Florida Giant will soon be finished, and the 40-ton cyanide plant will be enlarged from 40 to 100-ton capacity in the spring. Numbers of lessees are meeting with fair results.

Silverbow County

An amended complaint was filed last week in the district court by the Western Federation of Miners and Charles H. Moyer, against Martin Scahill and other officers of Butte Miners' Union No. 1. The national organization wishes to assert temporary control over the local. It is claimed that charges have been preferred against the Butte officers by more than 10% of the membership. This, according to the constitution and by-laws, gives the national president the control.

A mine guard named T. Mondoe was shot and fatally wounded in a street in Butte by H. Robinson, a unionist and leader of the I. W. W., on February 12. It appears that an automobile containing four men drove up to where the victim was standing, and the accused shot him.

The second number of *The Anode*, published by the Anaconda company, contains notes on improvements at the reduction works by Frederick Laist, recent appointments and accidents in the Butte mines. A chart shows the accidents per 10,000 shifts worked during 1914, fatalities being 1.49%, serious 12.62%, and slight 85.89% of the total. Moving pictures have been taken of the surface and underground of the Tramway mine.

The Butte & Superior company has started excavating for extensions to the flotation plant of the mill. Rich ore is being opened at 1200 ft. In January the mill treated 36,840 tons of ore with 91.92% recovery. Concentrate produced was 11,730 tons assaying 53.76% zinc, containing a total of 12,612,000 lb. In this month of 1914 the figures were 33,520 tons, 91.76%, 11,124 tons, 51.61%, and 11,482,483 lb. zinc.

NEVADA

Esmeralda County

A new map, 39 by 52 in., of the Goldfield district has just been published by Lee W. Davis and E. A. Byler, surveyors, of Goldfield. It is complete in every respect, and shows all mining claims clearly.

Development in the Jumbo Extension continues satisfactory, and a daily shipment of one carload of $50 ore is being made.

White Pine County

The report of the Nevada Consolidated Copper Co. for the last quarter of 1914 gives the following information. The property is being worked at 50% capacity. Overburden stripped amounted to 245,969 cu. yd., and the mines produced 416,825 tons of ore, 98% coming from the pits at Copper Flat. The output of copper was 8,065,236 lb., compared with 11,258,421 lb. in the previous quarter. The profit and loss account shows a total profit of $370,847, and after paying a dividend of $749,-

796, there was a deficit for the term of $378,949. Undivided profits amount to $2,290,626. The total charges, save ore extinguishment, were 8.42c., while earnings were 11.504c. per pound of metal. Copper on hand and in transit at the end of the period was 22,378,133 lb., and metals are valued at $3,114,862. The year's output was 49,244,056 lb., against 64,972,829 in 1913.

NEW MEXICO

Grant County

The Chino Copper Co. reports as follows for the last quarter of 1914: The mill treated 347,200 tons of ore averaging 1.862% copper, with 69.14% recovery. Concentrate smelted yielded 8,935,585 lb., compared with 11,491,120 lb. in the third quarter. The outputs for 1914 were 1,907,300 tons of ore and 56,841,977 lb. of metal, against 53,170,145 lb. in 1913. The net cost of production was 7.71c., against 7.37c. per pound in the previous term. The net profit was $285,933, about half of the September quarter.

OKLAHOMA

In *Bulletin* 22 (142 pages) of the State Geological Survey is the director's biennial report, and mineral resources of the state and statistics of production from 1901 to 1914. All subjects connected with the mining industry of the state are discussed. The output of all mineral products in 1913 was valued at $80,031,630, against $4,907,543 in 1902. Of the 1913 production, oil contributed $59,581,948; natural gas, $7,436,389; coal, $8,542,748; and zinc, $1,306,368.

OREGON

Jackson County

(Special Correspondence.)—At the Braden mine at Gold Hill a motor-driven sawmill has been erected, resulting in lower charges for lumber, which is cut on the property.——The Beaver Portland Cement Co.'s quarries are being arranged for a large output this year. A great deal of the cement used in the southern Oregon highways was made in this Company's plant.——The placer mining season at Gold Hill has been satisfactory to date. The old Sterling mine is still producing gold. More prospecting has been done in the Trail creek, Jump-off-Joe, and Elkhorn districts this season than for many years. The area is rather remote from transport, but gold, copper, cinnabar, and asbestos deposits have been found. A motor-driven mill and concentrating plant have been erected at the Nellie Wright mine near Gold Hill. The mine is opened to 150 ft.——The Lucky Bait continues to make regular gold returns. The mill is on Sardine creek.

Gold Hill, February 6.

SOUTH DAKOTA

Lawrence County

The Hidden Treasure shaft, in Deadwood gulch, is 275 ft. deep in mineralized formation. Jackhamer drills are being used.——The Echo company is also sinking, and an electric pump is being installed.

UTAH

The itinerary of U. S. Bureau of Mines rescue-car No. 2 is as follows: Bingham, January 27 to February 11; Murray, 12th to 18th; Tooele, 19th to 26th; and Park City, 27th to March 14.

Juab County

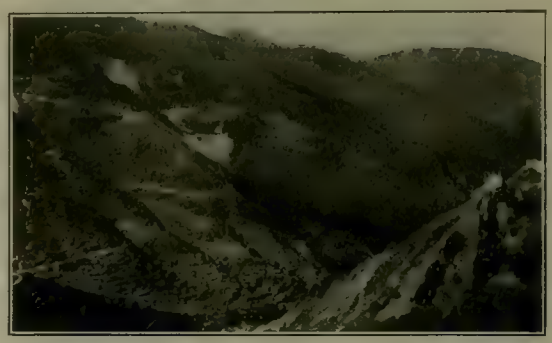
The heaviest snowstorm for many years visited Tintic on February 10. Power and telephone lines were blown over. Ore shipments were considerably reduced, the week's total being only 79 cars.——Owing to the price of spelter, buyers of zinc ore have announced that they will accept ore containing 24% and up. This will be good news for the East Tintic Development, Gemini, Lower Mammoth, May Day, and Yankee mines.

The Chief Consolidated Mining Co.'s report for 1914, Walter Fitch, manager, and Cecil Fitch, superintendent, contains the following: Development totaled 7054 ft. This included a cross-cut at 800 ft. connecting the workings at 1000 ft. with the shaft. Ore will soon be mined from the 800-ft. level. Some zinc ore occurs at 900 and between 1000 and 1200 ft. At 1600 ft., good silver-lead-gold ore was developed. A drift is under way at 1800 ft., and will connect with the ore at 1700 ft. in a few months. Diamond drilling was done to prove certain ground, and showed great economy over driving drifts. Poor metal prices reduced profits considerably. From 39,629 tons of ore there was a net profit of $76,522. Eleven blocks of zinc ground in the May Day has been leased to 22 miners.——The Gemini will resume work during the month. ——Rich lead-silver ore has been opened at 1700 ft. in the Eagle & Blue Bell.——The new 100-ton mill of the Utah Minerals Concentrating Co. will soon be started. A large supply of ore has been arranged for.

Salt Lake County

The report of the Utah Copper Co. for the last quarter of 1914 contains the following data: Stripping removed amounted to 955,675 cu. yd. The Magna mill treated 1,035,303 tons of ore averaging 1.5062% copper, with 64.86% extraction. This recovery was 3.27% lower than the previous term, due to some carbonate getting mixed with the sulphide ore. It is impossible to keep the two ores separate. The yield of metal was 20,229,012 lb., compared with 28,686,672 lb. in the September quarter. With certain credits the net cost of production was 6.688c. per pound. The net profit was $673,590, about half the previous amount, and with the Nevada Consolidated dividend and sundry income, the amount available was $1,076,073. A dividend of $1,218,367 left a deficit of $142,293. Copper on hand amounted to 40,546,627 lb. The year's output was 121,779,401 lb., compared with 119,939,809 lb. in 1913.

The Alta Consolidated, in the Alta district, has a good tonnage of ore awaiting shipment, but weather conditions



HIGHLAND BOY MINE, BINGHAM CANYON, UTAH.

have interfered with work.——In the Columbus Extension, miners have driven along a quartzite and limestone contact 20 ft. beyond where the vein was first cut. The ore is 5 ft. wide. An air pipe for ventilation is being installed. This is to be 4000 ft. long, and will have an exhaust fan on the end. Ore shipments will commence in a week or two.

Summit County

Suit has been started against the Silver King Consolidated Mining Co. and its president, Solon Spiro, for stock worth $8500 and participation in dividends amounting to $64,963, by James D. Murdoch. The plaintiff alleges fraud was practised on shareholders in the Company when it was reorganized under the laws of Utah, previously being incorporated in Wyoming. The case is involved, and many other points are the subject of dispute.

WASHINGTON

Stevens County

At Chewelah, the United Copper Co. has diamond drills at work. Above 1000 ft. there is estimated to be 395,000 tons of ore. The mill is being increased to 200-ton capacity per day. Oil is needed to start the flotation process.

The Security Copper Co., which has a large area of ground two miles south of the United Copper at Chewelah, held its meeting at Spokane recently. L. K. Armstrong is manager. Six parallel veins of good width have been opened. It is proposed to purchase a hoist and air-compressor, and sink to 500 ft.——Copper claims in the Loon Lake district, about 10 miles south of the United Copper, which have been idle for about 18 years, are to be reopened in the spring. They are owned by J. C. Haas and H. H. Shallenberger, of Spokane, and C. E. Agnew, of Sharpsville, Pennsylvania. Previous shipments to Tacoma returned 25 to 30% copper. — Some high-grade silver ore has been cut in the Double Eagle mine in the Chewelah area.

CANADA

British Columbia

Diamond drilling has proved a large tonnage of ore at Princess, and the British Columbia Copper Co. has decided to erect a concentrator there. A railway is to be constructed from Princeton to Princess and Voigt.——Development is to be resumed at Voigt, and New York interests will erect a smelter.

Ontario

During January the Nipissing high and low-grade mills treated 166 and 6291 tons of ore, respectively. The refinery shipped 709,174 oz. of refined silver, part of which was from custom ore. At vein 64 the winze below 900 ft. is down 101 ft., where the vein is from 1 to 8 in. wide, of low value. Work at shaft 73 was very encouraging.

The third annual meeting of the Dome Lake Mining & Milling Co. was held at New Liskeard on February 8. The main shaft is down 400 ft., and a great deal of work was done at 180 and 300 ft. The mill started in October, and to the end of 1914 yielded bullion worth $8850 and concentrate valued at $1566. The January output was $11,000. A. H. Brown is manager.

KOREA

The Oriental Consolidated mills and cyanide plants treated 28,688 tons of ore in December, yielding $148,216. On the 23rd the Maibong mill was destroyed by fire which started in the adjoining auxiliary electric power plant. The Kuk San Dong 40-stamp mill will be re-erected in its place. The January clean-up was $135,485.

MEXICO

Hidalgo

The length of the new shoot on No. 16 level of the Santa Gertrudis is 85 ft. This will average 7 ft. wide, and $4 gold and 45 oz. silver per ton. The mill is now treating 600 tons per day, cyanide supplies coming to hand. There is no trouble in the district.

Sonora

In spite of a shortage of food at Nacozari, the Moctezuma Copper Co. has resumed operations. There is enough fuel on hand for a month or so. General Calles will not allow food to go south, but has consented to the burned bridges being cribbed up between Nacozari and Douglas, only for the passenger automobile.

PHILIPPINE ISLANDS

The Philippine Dredges, Ltd., had the following output during the half-year ended October 31, 1914: No. 1 boat, 117,767; No. 2, 141,195; and No. 3, 344,758, a total of 603,720 cu. yd. of gravel with 5580 oz. gold, equal to 9.5c. per yard.

PERSONAL

J. E. Spurr was in San Francisco.

Arthur W. Jenks has gone to Bakersfield.

Charles Janin has returned from the East.

W. H. Ganst has returned to San Francisco.

Fred Searles was down from Goldfield, Tuesday.

C. H. Munro is leaving for Columbia, South America.

J. W. Finch passed through San Francisco on his way to Butte.

C. Willard Hayes is now at Washington, D. C., and is improving in health.

C. W. Purington was in New York last week and has returned to London.

R. M. Catlin laid the cornerstone of the new vocational school at Franklin Furnace, New Jersey, lately.

Arthur H. Adams has resigned his position as cyanide superintendent for the Easton-Pacific Co. and hereafter his address will be 975 E. 4th street, Long Beach, California.

The Alaska Mining and Engineering Society of Juneau, Alaska, was organized recently, and seems to be one which may do a great amount of good in this district, and give the numerous local engineers an opportunity to meet and discuss the problems of this low-grade area. While it is non-political, the Society should exercise a strong influence on the Territorial Legislature in its deliberations on mining and engineering problems. A banquet was held on January 30, and evidence of the brotherly spirit prevailing is shown in the accompanying cartoon. The speakers' initials are correct, but we cannot vouch for the Christian names.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, February 17.

Antimony	20 —20¾
Electrolytic copper	15½ 15¾
Pig lead	4.10— 5.05
Quicksilver (flask)	$62.50
Spelter	9 — 9¼
Tin	38 39½
Zinc-dust, 100-kg. zinc-lined cases	11½—15

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, February 17.—Copper is firm, and lead and spelter are strong, spot metal being scarce. The Calumet & Hecla company will pay $5 per share on March 18, this being the first dividend in nine months.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

On February 11 the highest price ever paid for zinc ore was reached at Joplin, Missouri, when one concern bought at $73 per ton. Buyers are active, and the market is from $1 to $2 stronger on all grades than in the previous week.

So much spelter is being sold for export that everyone is now beginning to study the figures, which showed that in the week ended January 16, France took 2,344,366 lb.; England, 5,147,503 lb.; Russia, 1,608,417 lb.; and miscellaneous, 369,831 lb., a total of 9,470,117 lb. The demand for spelter free from lead and iron, such as is required in making brass for cartridge cases, continues so strong that the New Jersey Zinc Co., which has an established reputation for spelter of this quality, is said to be receiving 16c. per pound for its Horsehead brand. The high price of spelter makes good business for the companies which sell the product of their own ores, but makes the custom smelters nervous, since they fear that the high price of the metal will only prevail long enough to fill their bins with ore settled for at the high price, but the product of this may have to be sold at the usual figure. The market statisticians at once set to work to figure out how much profit the Butte & Superior is making at the present price level, and the president of the Company has stated that the smelting contract provides for a smelting charge of $14 per ton on 50% concentrate when spelter is at 5c., with a $1.40 per ton increase for each cent of increase in the price of spelter. Thus with spelter at 8c. the Company pays a smelting charge of $18.20 per ton and makes a profit of $19, not including the silver content

COPPER

June	13.60	....	Dec.	12.75	....

Exports of copper during the week ended February 6 totaled 9,714,979 lb., worth $1,371,127. Of this, 4,311,732 lb. went to England, 1,613,099 lb. to Sweden, 1,526,627 lb. to Italy, 1,064,471 lb. to Scotland, and 560,188 lb. to France. The market continued firm last week despite the general report of increased output. There was not much large buying at the end of the week, but sellers seemed to expect a further slight advance in price. Operations are reported to be about to re-start at Cananea, Mexico.

LEAD

Lead is quoted in cents per pound or dollars per hundred pounds, New York delivery.

Date.		Average week ending

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

ANTIMONY

A Chinese mining and smelting company has opened an office in New York for the sale of this metal in the United States. Imports in 1914 totaled 14,263,629 lb., worth $696,362, of which 4,300,892 lb., valued at $190,737, was from China.

BOOK REVIEWS

MINING COSTS OF THE WORLD. By E. N. Skinner and H. R. Plate. McGraw-Hill Book Co., New York, 1914. P. 400. Maps, index. Sold by the *Mining Press*, San Francisco. Price, $5.

This convenient handbook is a compilation of official data as to operating costs, capitalization, profits, and other statistics necessary to an appraisal of the value of the properties of the principal mining companies of the world. The compilers have made it more useful by calculating costs not given, and by the supplying of much additional information, as the situation of the properties, character and size of deposits, methods of working, depth of mines, water to be pumped, and general operating conditions. The mines are given alphabetically under countries and states, while an index aids in finding any desired property. Well executed maps of the principal mining districts of the world also aid in making clear the relative situation of the mines. The data given are the latest available for each property, some being as recent as the first half of 1914. It is the intention of the compilers to revise the volume from time to time, bring the data up to date, and supply new material as it becomes available. The drawbacks of the book are chiefly unavoidable; from those companies which do not give out data they naturally cannot be obtained, and for those companies which keep their accounts in such form that little useful information can be obtained from them, it is difficult to supply figures, though the compilers have added much from sources of private information with the co-operation of well known engineers. Thus, for example, operating costs given out by most of the South African companies are decidedly misleading, since they only include a part of the expenses properly chargeable to operation, the dividends declared in a year averaging about 30% less than the operating profit shown in the accounts. The form of the book forbids any exhibition of literary skill, but grammatical errors, as "layed" for laid, "Sidney" for Sydney, verbs without a subject, and such 'shirt-sleeve geology' as "ribs of lime occur in the orebodies" should be amended in subsequent editions. The book is durably bound in morocco, of convenient pocket size, and should prove a highly useful manual of reference to mining engineers in all countries.

NORTHERN PATAGONIA. By Bailey Willis, Vol. I, text. P. 464. Ill. Vol. II, maps. Scribner Press, New York, 1914. For sale by the *Mining Press*, San Francisco. Price, $8. Vol. II sold separately at $2.

Patagonia is a *terra incognita* to most people, and for many years its sovereignty was in dispute, being claimed by both Argentina and Chile. In 1902 the title was confirmed to Argentina by arbitration, and the authorities of that progressive country at once set about the intelligent development of its new territory. Argentina, if superimposed on the North American continent, would extend from Tampico, Mexico, to Hudson bay, and from El Paso to New Orleans, exhibiting a corresponding range of climate, topography, and general conditions. Patagonia roughly corresponds to the area between Denver and the Missouri river, prolonged to an apex near Hudson bay. Mountainous on the west, the eastern portion consists largely of arid or semi-arid plateaus and plains extending to near the sea coast. The Ministry of Public Works of Argentina in attempting to foster the development of this area wisely decided to avail itself of the experience gained in similar areas in the United States, and a Comisión de Estudios Hidrológicos was organized under the supervision of Bailey Willis, formerly of the United States Geological Survey, to carry on topographic, geologic, and economic surveys of the territory. The Comision was organized in 1911, and at first devoted its attention to the discovery, if possible, of an underground water supply in the area tributary to the eastern end of the railway then under construction from Puerto San Antonio on the Atlantic to Lago Nahuel Huapi, in the Andes, corresponding roughly to a line from Kansas City to Leadville. No sufficient supply of underground water could be obtained, but it was found feasible to conduct the flow of the Orroyo Volcheta in a canal some 60 miles along the railway line to the port. It was next necessary to determine whether it was practicable to cross the Andes with the proposed line. Work in the autumn of 1911 showed this to be the case, as well as demonstrating the resources of the Pampas and the Andes which, when developed, will be tributary to the railway. A survey was then undertaken along the entire railway line from the Atlantic to the Andes between latitudes 39° 40' and 43° 40', an area of about 12,000 square miles. The personnel at first was: Bailey Willis (geologist, U. S. Geological Survey), director; Emilio E. Frey (Argentina), assistant director and topographer; C. L. Nelson and W. B. Lewis (U. S. Geological Survey), topographer; J. R. Pemberton (Stanford University) and C. W. Washburn (U. S. Geological Survey), geologists; W. D. Jones (University of Chicago), economic geographer; Otto Luginbuehl, Walter Graenacher and Walter Eschmann (Switzerland), assistant topographers; in the course of the work Messrs. Eschmann and Graenacher resigned. J. S. Mercer (Chicago) and Otto Schneider (New Zealand) were appointed assistant topographers. D. L. Raeburn, civil engineer, and J. G. Morgan, assistant engineer, were added to the corps in 1912-13 to survey a railway location. Ricardo Dowall (Argentina), R. M. Rodriguez (Argentina) and R. M. Hatch (University of Wisconsin) served successively as secretaries in charge of administration and accounts.

As a result of the work of the commission excellent maps have been prepared and the topographic features, agricultural resources, grazing industry, forest and water resources of the area learned, all of which is interestingly set forth in this volume. The area proved to be ill adapted to the making of a geological section, which perhaps explains why no mention is made of mineral resources. An appendix gives the records of meteorological observations in the Andes and a report on numerous samples of wood collected. The book is an excellent example of modern bookmaking art and is illustrated with beautiful photogravures, and numerous maps both in the text and as inserts. It is a valuable contribution to a better and more exact knowledge of South America, especially of an area which has great future possibilities.

RECENT PUBLICATIONS

Bulletin of the Geological Society of America. Vol. 25, No. 4. December, 1914. Joseph Stanley-Brown, editor. P. 367. Ill., index. Washington, D. C.

BASE MAP OF MISSOURI. Scale, 1:500,000. 42 by 47 in. Missouri Bureau of Geology and Mines. Compiled in co-operation with the U. S. Geological Survey. Rolla, 1914.

MINERALS OF PENNSYLVANIA. By Amos P. Brown and Frederick Ehrenfeld. Report No. 9. P. 160. Ill., maps, index. Topographic and Geologic Survey of Pennsylvania. Harrisburg, 1913.

GYPSUM IN CANADA. By L. H. Cole. P. 256. Ill., maps, index. Department of Mines, Ottawa, 1913. This is an excellent treatise on the subject, and the illustrations show great care in reproduction. The work covers the origin of gypsum, its associated minerals, production (549,856 tons from Cana-

dian mines in 1912), occurrences in Canada, technology, and includes a bibliography.

Some Measuring Devices Used in the Delivery of Irrigation Water. By California agents of irrigation investigations. *Bulletin* 247. P. 68. Ill., chart. University of California, Berkeley, 1915.

The United States of Europe, and The Preparedness of America. By Nicholas Murray Butler of Columbia University. Reprints from *The New York Times* of October 18 and December 10, 1914, respectively. P. 17 and 18.

Report of Conference on the Mine Workers' Relief Fund. P. S. Chamber of Mines, Kalgoorlie, Western Australia, 1914. Editorial mention of the efforts in that state to relieve miners incapacitated by lung troubles was made in the *Press* of February 6.

First Biennial Report of the Department of Labor of Montana, 1913-1914. W. J. Swindlehurst, commissioner, and W. B. Orem, quartz mine inspector. P. 350. Index. Helena, Montana, 1914. An abstract of this report was published in the *Press* of February 6.

The Journal of Geography. November and December issues. Vol. XIII. Ray Hughes Whitbeck, editor, and Lawrence Martin, associate editor. P. 32. Illustrated. University of Wisconsin, Madison, 1914. This monthly contains a lot of interesting general geographical matter.

Metal Statistics, 1915. By C. S. J. French and B. E. V. Luty, editors of *The American Metal Market* and *Daily Iron and Steel Report*. P. 344. Index. The American Metal Market Co., 81 Fulton street, New York. This is the eighth annual edition of a valuable compilation of metal statistics, covering production, prices, exports, and consumption, and is published in a handy pocket form.

The Mining Congress Journal. P. 64. Illustrated. American Mining Congress, Munsey building, Washington, D. C. January, 1915. "As a means through which to further its work looking to safety, efficiency, and conservation, the American Mining Congress presents to you the first issue of *The Mining Congress Journal*," is the opening sentence on the first page of this new publication. The aims of the Congress are well known among mining men, and this initial issue of its 'mouthpiece' covers many subjects of interest.

Coal Mining Practice in District III, Illinois. By S. O. Andros. *Bulletin* 9. P. 30. Illustrated. University of Illinois, Urbana, 1915. The average room-and-pillar mine in Illinois extracts only about 50% of the coal in the bed. Improper dimensions of workings and fear of squeezes or surface subsidence prevent pillar drawing in most mines. In District III, however, two mines working on the room-and-pillar system obtain an extraction of coal almost equal to that obtained by long-wall mining. This district produces 512,178 tons of coal per year.

Official Year-Book of the Commonwealth of Australia. Statistics for period 1901-1913. Compiled by G. H. Knibbs. No. 7. P. 1098. Ill., maps, index. Commonwealth Bureau of Census and Statistics, Melbourne, Victoria, 1914. This interesting and valuable annual gives details of every phase of life and industry of the 5,000,000 people living in Australia and Tasmania. The total production of all industries in 1912 was equal to $213.64 per inhabitant; and the foreign trade per head is only beaten by Belgium, New Zealand, and Switzerland, and is nearly four times that of the United States on this basis.

Department of Mines, Mines Branch, Ottawa, Canada, 1914:

Mineral Production of Canada in 1913. General summary. Compiled by John McLeish. No. 319. P. 50.

The Cushing Oil and Gas Field, Oklahoma. By Frank Buttram. *Bulletin* 18. P. 108. Maps. The daily output of this state exceeds 300,000 bbl. There is 11,000,000 bbl. of oil in storage about this field.

The Neva Limestone in Northern Oklahoma, with remarks on the correlation of the vertebrate fossil beds of the state. By J. W. Beede. *Bulletin* 21. P. 37. Ill., map.

Director of the State Geological Survey Biennial Report to the Governor of Oklahoma, 1914. Part I. Mineral resources of Oklahoma and statistics of production. Part II. By C. W. Shannon. *Bulletin* 22. P. 142. Illustrated. Further mention of this work will be made in another issue of the *Press*.

U. S. Geological Survey publications, Washington, D. C., 1914:

Thirty-fifth Annual Report of the Director (George Otis Smith) of the U. S. Geological Survey to the Secretary of the Interior for the fiscal year ended June 30, 1914. P. 163. Maps, index. Appropriations for the year under review totaled $1,517,920. Geologic investigations were conducted in 47, topographic surveys in 35, and stream measurements in 39 states and territories. The land classification work included reports on 45,000,000 acres. In connection with statistics of mineral production, the Survey co-operates with 16 states and corresponds with 90,000 producers. The work of the department is reflected chiefly in publication and distribution of reports and maps. The total of all books, folios, and maps received was 1,428,441, and of distributed 1,105,711, a large increase. Geologists of all grades employed totaled 146. Mail of all kinds received totaled 255,502 pieces.

Geology and Underground Waters of the Southeastern Part of the Texas Coastal Plain. By Alexander Deussen. No. 335. P. 365. Ill., chart, maps, index.

Water Resources of Butte, Montana. By O. E. Meinzer. No. 345-G. P. 47. Ill., maps. This report was covered in the *Press* of February 13 under the head of Montana news.

Profile Surveys in Hood and Sandy River Basins, Oregon. Prepared under direction of R. B. Marshall. No. 348. P. 6 and 8 maps.

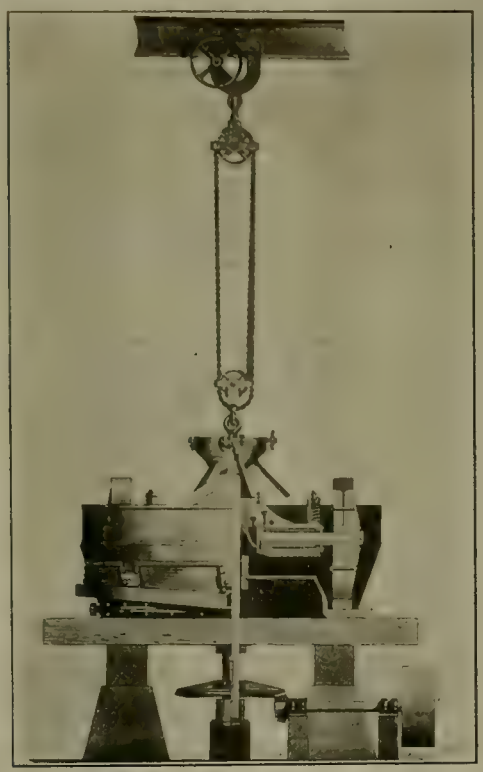
Profile Surveys of Snoqualmie, Sultan, and Skykomish Rivers, Washington. Prepared under direction of R. B. Marshall. P. 7 and 12 maps.

New Machines and Devices

The Mill That is Different

The above is the phrase used by the makers to describe the Sears 'Acme' mill, which is made for the Sears-Smith Engineering Co., of Oroville, by the Stockton Iron Works.

The Sears mill was designed by an experienced millman and practical amalgamator. This machine consists of a rolled-steel die and four crushing wheels equipped with rolled-steel tires. The axles are forged steel, keyed fast in the wheels and revolving in boxes which are secured in the hollow arms of the spider. These arms are open at the top to facilitate the removal of the boxes and also to permit the wheels to rise individually, preventing any undue strain on the central shaft.



SECTION OF AN ACME MILL, ALSO SHOWING CRUSHING APPARATUS LIFTED OUT FOR CLEANING.

The weight of the spider is supported on the wheels, thus increasing the crushing weight. The pan is cast in one piece with launder which extends half-way round, thus preventing the launder loading up with sand at the back of the mill and running over, as is the case with many styles of Chilean mills. The manufacturers recommend the Hamill ore-feeder as suitable for this mill. The feed hopper on the top of the spider is fitted with four feed pipes to convey the feed (both water and ore) directly to the die between the wheels. The hopper is also provided with means for operating the feeder arm which is entirely automatic and self-regulating. The mill may be run slowly and an overflow discharge used, dispensing with screens, but these are furnished with the machine. Dies last from 4000 to 6000, and tires from 6000 to 8000 hours. The following are details of the mills made. 3-ft., sectional for mule transport, when ordered, this and the ordinary having a crushing weight of 3500 lb., absorbing 3 to 5 hp., and crushing 5 to 20 tons to 30 mesh per 24 hours, and 6-ft., crushing weight 10,000 lb., 7 to 15 hp., and 20 to 60 tons per day. Special claims for this mill are good amalgamation and easy clean-ups, no trouble in starting with full load, automatic feed, wide range of adjustment, accessibility, and low cost of operation. An 'Acme' mill can be added to a stamp-mill to further reduce the ore. The Sears-Smith Engineering Co. has just issued its illustrated catalogue describing the new machine.

Improvements in Water-Wheel Generators and Mine Locomotives

Conspicuous among the improvements in the water-wheel type generator class of apparatus, is the suspension thrust-bearing designed for vertical shaft type sets, the bracket of which is rigidly supported by the generator stator, with the bearing carrying the entire weight imposed by the rotor, water-wheel, and water thrust. Among the larger machines for which these thrust bearings have been provided by the General Electric Co. may be mentioned: two 11,170-kva., 6600-volt, 60-cycle sets, operating at 180 r.p.m.; three 9000-kva., 12,000-volt, 40-cycle sets, operating at 185 r.p.m.; and four 10,000-kva., 6600-volt, 60-cycle sets, operating at 200 r.p.m. All of these generator sets are tested to withstand double normal speed, and the thrust bearings of the four groups referred to sustain respectively aggregate weights per unit of 75, 77, 100, and 175 tons. An indication of a recent tendency in hydro-electric development, brought about primarily through the improved efficiency in water-wheels, is the use of generators of relatively small capacity and low speed, which has rendered it possible to utilize effectively numerous low-head water-powers that heretofore could not be economically de-

5200-KW., 250-VOLT DIRECT-CURRENT GENERATOR FOR WATER-WHEEL DRIVE.

veloped. Several machines of this type have been constructed by the General Electric Co. during the past year.

All of the mine locomotives manufactured by the Company in 1914 were provided with commutating pole motors and ball bearings as standard equipment, and the operating records of those placed in service during the year show that these improvements have reduced the number of interruptions to

6250-KVA. WATER-WHEEL DRIVEN GENERATOR, SHOWING CONSTRUCTION OF SUSPENSION THRUST-BEARING BRACKET.

service and have resulted in decreased maintenance costs. The increasing output of many mines has rendered it necessary to equip with locomotives of relatively large capacity, capable of handling heavy trips over steep grades and for long hauls. For this class of service there have been built a number of 3-motor 15 and 20-ton locomotives. There has been a definite increased demand for the storage battery type of locomotive for gathering work, as it has been demonstrated that in this service each locomotive will effectively displace at least two or three mules. Heavy units are not, as a rule, required, and the locomotives of this class so far provided have been rated at from 3 to 7 tons. Most of these are of the straight storage battery type; but a limited number have, in addition, been equipped so that they can operate from a trolley wire when in the main headings of a mine. The advantages of this arrangement are obvious in that by means

COMBINATION STORAGE BATTERY AND TROLLEY MINE LOCOMOTIVE. PLATFORM REMOVED TO SHOW INTERNAL ARRANGEMENT.

of a small self-contained motor-generator set, the battery may be automatically charged while the locomotive is running on the trolley. When the locomotive is working in the rooms gathering the cars, a varying percentage of the battery charge will be consumed; but as soon as the locomotive is again operated on the trolley, these losses are automatically compensated for. With this dual system of operation, the battery need never be entirely discharged; and if space limitations are severe, it permits the use of a smaller battery than would otherwise be necessary.

An interesting discussion of the work of electric locomotives in mines is published in the February *Transactions* of the A. I. M. E., by J. W. Gwinn, of Kellogg, Idaho.

Commercial Paragraphs

The HOLT MANUFACTURING CO., of Stockton, California, *Caterpillar Times* for January described the work of a 'Cat' in hauling wood at Fairbanks, Alaska, the temperature being 40° below zero. Also some notes from Australia and Europe on the value of this machine.

The C. O. BARTLETT & SNOW CO., Cleveland, Ohio, has issued *Bulletin* 43, describing the 'Cobasco' system of handling material by means of skip hoists. Using an electrically-driven machine the apparatus is quite automatic in action, and unloading, crushing, and elevating is done at as low as 1.5c. per ton of coal. The hoist stands on one base and is very compact.

The GENERAL CEMENT-GUN CO., 914 South Michigan avenue, Chicago, sends a reprint from the *Journal* (March 1914) of the Western Society of Engineers, of a paper, 'The Cement-Gun and Its Work,' by Carl Weber, the construction manager of the firm. It covers 44 pages, with illustrations, and explains the use of this apparatus, in varied construction, and results.

The MINE & SMELTER SUPPLY CO., of Denver, describes the 'Massco' oil-burning assay furnace in a pamphlet. The walls are very refractory, and are enclosed between heavy iron plates. A hood carries fume from the room. The muffle is well supported and protected from the direct action of the flame. The burner tuyere makes less noise than usual; and three types of oil burners are supplied. Five sizes of furnaces are made.

A. LESCHEN & SONS ROPE CO.'s *Leschen's Hercules* for February contains short descriptions of the following construction in which its rope and gear is used. The Houston ship canal, connecting Houston, Texas, with the Gulf of Mexico; setting steel for bridge over Grand river, Michigan; Kansas City Twelfth Street trafficway; and placing statuary on the Grand Central terminal station, New York.

The WESTERN ELECTRIC CO. has distributed a short note entitled 'The Transcontinental Voice Highway.' This deals with the feat of telephoning from New York to San Francisco, 3400 miles apart, on January 25, 1915. This line consists of four copper wires of No. 8 B. W. G. gage, weighing a total of 5,920,000 lb., strung on 130,000 poles. All of this material was supplied by the Western Electric Co., as well as the telephone apparatus.

The BUCYRUS CO., of South Milwaukee, Wisconsin, states that it has received another order for a dipper dredge for Panama, similar, only larger, to those described on this page of last issue. The Fushun Collieries in Manchuria, China, also ordered two 60-C and one 150-B steam-shovels and a class 24 drag-line, the value of the machinery being about $425,000. Some results are given in the notes of the operations of a 225-B revolving shovel at Mulberry, Kansas, and a 14-B at Richmond, Virginia.

The CHAIN BELT CO., of Milwaukee, Wisconsin, has issued its general catalogue No. 56. It consists of 303 pages with an index, and is profusely illustrated with pictures of the varied machines manufactured by this Company. The text deals with elevating and conveying machinery, chain belt, sprocket wheels, transmission machinery, etc., for sawmills, cement mills, canning plants, power plants, sand and gravel plants, potteries, fertilizer plants, and practically every line of industry. Two chain belts particularly features are 'Griplock' (malleable), and 'Chabelco' (all-steel). These chain belts are very suitable for many drives in mining properties. A lot of useful information is given on gearing, shafting, and bearings.

PLATINUM is one of the metals that the world rates high in value. Roughly it is twice as precious as gold. At times it brings even higher prices. It is an extremely useful metal, being essential to many chemical and industrial processes, so that its high rating is not due merely to the natural human desire to display as ornaments that which is scarce. Russia has almost a monopoly of platinum, yielding 300,000 of the 315,000 ounces annually produced. The metal is found in placers and for years has been mined by the simplest methods. Now dredges, similar to those used in gold mining, are being introduced, and in this issue Mr. R. S. Botsford tells the story of the erection of the modern, steel constructed, American dredge, whose hull is shown below.

New York Meeting of the A. I. M. E.—page 323

MINING PRESS

Established May 24, 1860, as **The Scientific Press**, name changed October 20 of the same year to **Mining and Scientific Press**, shortened January 2, 1915, to **Mining Press.** Controlled by T. A. Rickard.

Published weekly at 420 Market street, San Francisco, by the Dewey Publishing Co., H. Foster Bain, manager. Entered at the San Francisco post-office as second-class matter. Cable address, Pertusola.

Branch Offices—Chicago, 390 Fisher Bdg.; New York, 1308-10 Woolworth Bdg.; London, The Mining Magazine, Salisbury House, E. C., London. Cable address, Oligoclase.

Price, 10 cents the copy. Annual subscription: United States and Mexico, $3; Canada, $4; other countries in postal union, 21s. or $5.

ARTICLES

LOOKING FORWARD 322

The problem of giving graduates of technical schools some first hand knowledge of the human element with which they are to work, is being solved by giving them the opportunity to serve as teachers to workmen, especially foreigners. The industrial department of the Y. M. C. A. is conducting the work and at the A. I. M. E. meeting in New York, J. Parke Channing told about it. His most interesting paper is abstracted here.

NEW YORK MEETING OF THE AMERICAN INSTITUTE OF MINING ENGINEERS 323

The annual meeting of the Institute held in New York last week was characterized by an excellent program and lively discussion. The sessions were held in sections devoted to 'Safety and Sanitation,' 'Non-Metallic Minerals,' 'Iron and Steel,' 'Petroleum,' and 'Metallurgy.' The annual dinner, presided over by the newly elected president, W. L. Saunders, was attended by over 300 and was greatly enjoyed.

DREDGING FOR PLATINUM IN THE KYTLIM VALLEY, RUSSIA.
By R. S. Botsford 327

Platinum has been mined for 15 years in the Kytlim valley in the Ural mountains by means of a bedrock tunnel. On the Lobva, into which the Kytlim river flows, failing to divert the river, dredging methods were introduced. A Putiloff 5½-cu. ft. dredge is now at work and a new 7½-cu. ft. Marion boat with steel hull, designed to dig 16 ft. above and 25 ft. below water-level, has just been built. Full construction details are given.

TESTING BURNED-OUT ARMATURES.
By Leonard V. Newton 329

A convenient and simple method of determining the locus of trouble.

MISFIRES IN BLASTING AND THEIR CAUSES.
By J. B. Burgess 330

Misfires are a common source of loss, trouble, and danger. Mr. Burgess determined to learn if possible what causes them and how they may be prevented, and with that in view he conducted a number of experiments with caps and fuse from which he deduces some rules worth knowing. Incidentally he describes an excellent form of fuse-cutting table.

WATER IN PENNSYLVANIA ANTHRACITE MINES 333

It is estimated that for every ton of coal mined, one ton of water must be raised per year until the ground is exhausted. The amount hoisted has increased nearly 10% in the past ten years.

Page.

MOVING A SHOVEL UP AND DOWN GRADES 333

A steam-shovel is a heavy awkward machine to move over rough ground, but if it be properly prepared for the move, it is easily handled. In this note the correct method is described.

IMPROVEMENTS AT THE REDUCTION WORKS OF THE ANACONDA COPPER COMPANY 334

It was announced last week that flotation had been adopted at Anaconda. In this present note further details are given as to this and other changes in process and construction recently determined. The cost of the changes will amount to about $5,750,000, and the scheme of work both at Anaconda and Great Falls will be materially altered.

PLACER MINING CLAIMS IN THE YUKON.
By J. A. MacDonald 335

A brief synopsis of the correct method of locating and marking Yukon placer claims, with some illustrations of anomalous locations.

STAMP-MILL DATA AT THE BRUNSWICK CONSOLIDATED 337

A summary of the work at an important Grass Valley, California, mine. The treatment cost per ton is 92 cents.

SPELTER PRODUCTION OF THE BUTTE & SUPERIOR MINE 337

Summary of recent production of this great zinc mine at Butte.

MINING COSTS AT THE PORTLAND MINE 337

The total cost at this great Colorado gold mine is $1.98 per ton.

MEXICAN affairs continue unsettled, and A. B. C. intervention is now proposed. In the meantime the mail comes on regular schedule from mines in Villa territory.

AN embargo has been placed on the shipment of manganese ore from Russia to the United States, but several special exceptions have already been made, and it is not likely to be strictly enforced.

RUMOR has it that the lower levels of the Bonanza mine at Kennicott, Alaska, show carbonate ores in place of the chalcocite found at the surface. If this proves true there must needs be revision of opinion among geologists who pointed to the Bonanza as an example of primary chalcocite.

ONE million dollars is the amount the Butte Miners' Union has paid to the Western Federation of Miners, according to allegations made in a suit to determine control of the property of the local. It is further maintained that the Butte Miners' Union never received any benefits in return, and that much of the money was improperly spent by Mr. Charles H. Moyer and his associates of the Western Federation. That was rather a heavy price to pay for benefits that have at least been small.

WILFUL embezzlement is the cause assigned for loss in 73 out of 205 claims paid in December 1914 by the American Surety Company. The next most important source of loss was liquor, gambling, and immorality. Contrary to general opinion, speculation was an unimportant cause of trouble, though it is to be remembered that there is little speculative trading these days by anyone. The figures none the less are disappointing, as they seem to show a lower average honesty than most of us have been willing to credit to our fellows.

GERMANY is admittedly suffering from a shortage of gasoline, though a substitute has been found which can be widely used. We suspect, however, that no country will be more interested in Mr. W. O. Snelling's synthetic crude oil from which he is able to make repeated distillations of gasoline. The exhibition of this material and explanation of the process of manufacture was one of the features of the meeting of the American Institute of Mining Engineers last week. The commercial possibilities of the discovery are yet to be determined, but with so brilliant an investigator as Mr. Snelling, backed by so aggressive a business man as Mr. John T. Milliken, the matter will be thoroughly tested.

MANUFACTURE of steel rails has so far been a small business in Australia, but the first evidence of a new order of things has been given in the securing by the Broken Hill Proprietary company, at Newcastle, of a contract to supply the New South Wales government with 2500 tons of rails for certain lines in the west of that state. The price to be paid, delivered at Port Pirie, South Australia, is £8 7s. 6d., or $40.20 per long ton. The price for rails in the United States remains fixed at $28 per ton. Orders in January totaled 275,000 tons.

ELECTION of Mr. James F. Kemp to honorary membership in the American Institute of Mining Engineers, announced at the annual meeting, does not so much put him in distinguished company as mark recognition of the fact that he was already there. The list of honorary members is not so long that it may not be repeated. Omitting titles and degrees in the interest of economy of space, it includes: Richard Akerman, Frank D. Adams, Richard Beck, Andrew Carnegie, James Douglas, Haton de la Goupilliere, Robert A. Hadfield, Hans Hoefer, Henri Louis Le Chatelier, Ezequiel Ordonez, Alexandre Pourcel, Rossiter W. Raymond, Robert H. Richards, H. C. Emil Schroedter, John E. Stead, James M. Swank, Dimitry Constantin Tschernoff, Tsunashiro Wada, Charles D. Walcott, and James F. Kemp. To have your professional associates concede to you position in such company is an honor indeed, and there will be no difference of opinion as to the honor having been well placed in Mr. Kemp's case.

AMALGAMATION in Hardinge mills was a subject of discussion in our issue of January 16, but mention was not made of the fact that this practice has been dispensed with at the Plymouth mill because of the losses inherent to such practice. With the present system of treatment the discharge from 30 stamps is classified and the coarse material ground in a Hardinge mill, a second mill being held in reserve for the same purpose. The discharge from the Hardinge mill passes over two five by eight-foot copper plates, at the top and bottom of which are traps or wells of about four inches in depth. The upper traps catch as much as 70 per cent of the gold without the use of quicksilver, it being used solely

on the plates, which are cleaned once a day. After passing this first pair of plates the ore passes over a second set of ten 6 by 12-foot plates, where a further recovery is made. The present system of amalgamation is proving both simple and efficient. The discussion of the subject has attracted wide attention, and we are glad to add this week a thoughtful letter by Mr. J. W. Pinder, who draws on his note-book for illuminating experience in amalgamating while crushing, in Central America. While his machinery differed, the principle involved was the same.

MONTANA phosphate fields are to be extensively developed, according to present outlook. It is announced that the Montana Phosphate Company has contracted to deliver 80,000 tons per year to Mitsui & Company for shipment to Japan. The rock is to contain a minimum of 62 per cent of tricalcium phosphate and is to be mined near Great Falls.

FURTHER details regarding the improvements about to be made at Anaconda are presented this week. Incidentally it may be mentioned that an error in copying caused us to report the capacity of the new Minerals Separation flotation plant too low. Each of the 24 units about to be installed will have a capacity of 600 tons per day in place of 100 tons as stated. It will be seen that the total, nearly 15,000 tons, makes the plant a large one for a 'first unit.'

TONOPAH, after years of peacefulness so marked as to suggest that ownership of its principal mines by Philadelphians had linked it with the 'City of Brotherly Love' in more ways than one, is in the thick of litigation over apex rights. It has probably puzzled many to know why these difficulties have become acute after years of peace. The reason lies in the fact that mining has extended down through the zone in which narrow vertical veins are dominant and into one in which broad flat veins are characteristic. If apex rights to these can be established, they will be immensely valuable to the ones holding them. They will also, it may be noted, greatly complicate the matter of ownership of properties; but that is usually the result of attempts to enforce apex rights. The matter is now before the courts, and will be decided in due time on the basis of the law and the evidence, ... no' with a view to what any of us may think as to the general value or utility of the apex law, but it is illuminating none the less and helps explain why revision of the mining law is desired.

BEFORE the Panama-Pacific Exposition opened and when things were still in the planning, the professional exposition men who have been so prominent in the conduct of affairs, professed grave doubts as to the feasibility of an exhibit in an actual mine. It "never had succeeded," "people could not be induced to go in," and various other objections were urged. All these proved unfounded Saturday when a continuous stream of visitors passed through 'The Mine' almost from the time it was opened. When the mine explosion occurred and the rescue corps dashed up in their ambulance, put on their breathing apparatus and went below to bring out the supposed mangled miners, it required a number of police to keep back the crowd, and needed only a few weeping widows to give a final touch of reality to the scene. The mine itself is well worth a visit and is certain to have a large and beneficial influence on the public attitude toward mining. Mr. H. M. Wilson, the energetic chairman of the committee in charge, with the various mining and machinery firms whose co-operation made the exhibit possible, deserve the hearty thanks of the profession.

LOCAL TREATMENT of concentrate in individual plants, or a central custom plant, was suggested by Mr. M. W. von Bernewitz for California Mother Lode mining companies, in the *Press* of January 3, 1914. With the exception of the Kennedy Mining & Milling Company, at Jackson, which roasts and chlorinates its concentrate, practically all these companies send their product to a smelter. The Plymouth Consolidated contemplates local treatment of its concentrate. The shipment of this material is expensive, and regarding this cost the report of the Brunswick Consolidated Gold Mining Company, of Grass Valley, for the year ended January 28, 1915, supplies some interesting figures. During the current year this Company will erect a cyanide plant to treat its concentrate, and a large reduction in costs should result. In 1914, the 20-stamp mill treated 16,237 tons of ore, yielding 288 tons of concentrate, averaging $63.89 per ton. The freight and refining charges amounted to $3312, and loss in treatment $1472, the cost, including loss of value of 8 per cent in treatment, being $16.611 per ton, leaving a net value of $47.28 per ton. This is a high charge, compared with under $5 per ton at Goldfield, Nevada, where a rather complex treatment is used. The Brunswick management is to be commended for its effort to reduce expenditure, and we hope to see others fall in line.

PRESIDENTIAL WITHDRAWALS HELD VALID

The decision of the United States Supreme Court in favor of the government in the Mid West oil case, appealed from the District Court of Wyoming, announced last Tuesday, came as a distinct surprise to most of those who had followed the trend of recent decisions of the lower courts. Pending receipt of the text of the decision itself, it is difficult to make sure as to what was the determining factor. The general facts are well known. The Mid West company, operating in Wyoming, was one of those claiming land covered by the so-called 'presidential withdrawals,' and the decision is to the effect that the withdrawal was valid, and accordingly that the title of the oil company to the land is void.

It will be recalled that when in 1908 the conservation movement attracted attention and enlisted the support of Mr. Roosevelt, the public lands were open to entry under numerous laws. The cry was raised that the public domain was passing into the hands, not of genuine

settlers and developers, but of speculators; and there was only too much basis for the statement. It was widely felt that the system of administration and alienation of the public lands was wrong, that however well it might have operated in the past, and whatever benefits it might have conferred in the development of the West, the time had come for a radical change of policy. This sentiment was widespread. Mr. Roosevelt did not create it, he expressed it. He gave it force and effect, but fundamentally it represented a real public opinion which had developed slowly as a result of years of observation and reading. It had been brought to a focus by the land frauds made public shortly before, and there was an earnest purpose to make a change, though no consensus of opinion as to what the change should be. Congress having no certain guide as to what public opinion demanded and being always adverse to act in the absence of clearly expressed demand, did nothing. To be exact, certain leaders in Congress did all they could to prevent any change.

The President, on the contrary, acted in accordance with his usual plan of "acting first and leaving to subsequent generations the debate as to his constitutional authority." The executive department was the custodian of the public lands and it was clearly its duty to act as custodian for the people as a whole. For many years it had been customary for the President by simple executive order to withdraw from sale or entry tracts or areas of land needed or expected to be needed for any use of the government. So far as we are aware this right had never been questioned nor had it been passed upon by the courts. Probably it would never have been disputed if it had continued to be used in the moderate fashion of years gone by to segregate small tracts of lands for distinctly government use. Mr. Roosevelt, however, used the right to withdraw from entry large tracts of mineral lands and others primarily valuable as water-power sites pending legislation which, it was hoped, would establish a new system of sale or lease of the public domain. Mr. Taft, though professing himself in doubt as to the legality of the act, followed Mr. Roosevelt's example. There was widespread protest from those who hoped to secure further holdings of mineral land under the old easy terms and, acting on the advice of attorneys, many continued to locate oil 'placer' claims. Among other lands so located were those held by the Mid West Oil Company and whose status has just been finally adjudicated. There are thousands of acres throughout the West that were similarly located in defiance of the presidential withdrawal order, though presumably in good faith, believing the order itself invalid. Upon these lands there has been extensive development and property worth many millions of dollars is concerned. Presumably the title reverts to the United States, and the most that the present holders can expect is a preferential right to lease or buy under whatever new system may be established. Probably the very acuteness of the situation will operate to compel enactment of the bill now before Congress establishing a general leasing system for the oil lands. This has been the inevitable conclusion of the matter for several years, and we believe now, as we have from the first, that our friends in the oil producing business would have done better to have accepted the situation in 1910 and helped frame a suitable leasing bill rather than to have fought the inevitable.

THE FEDERAL TRADE COMMISSION

Months ago, among others, we urged that when the new commission came to be appointed to regulate interstate trade, a mining man might fitly be included. The reasons for such an appointment seem to us fairly obvious. Mining is, and will always remain, one of the great basic industries. Men in other trades and industries work with materials furnished by the mines and the farms. They come at things second hand. Despite the variety and bulk of the farm products of the United States, 65 per cent of the freight handled by the railroads, according to the late E. H. Harriman, comes from the mines. On important roads the freight from the mines amounts to more than 80 per cent, and on few, even in the prairie country, does it fall below 20 per cent. The relations of mining to interstate commerce are numerous and intricate, and many of the questions that will come before the new commission can only be fairly settled through a first-hand knowledge of mining problems and conditions. We know of no problems in interstate commerce that more demand the attention of the new commission than those that relate to bituminous coal production, and that is only one instance. An almost equally good case could be made out for petroleum and other mineral products. Such problems cannot be, and will not be settled by a board which has only second hand information and none of the feeling of an industry that comes from participation in it. It was not necessary that the commission should consist of mining men, but not to include one, appeals to us as a serious error of judgment. Worse than that, however, we esteem the fact that the majority of the members of the new commission, organized to determine business matters, are men whose relation to business itself is secondary. Mr. J. E. Davis and Mr. George Rublee are lawyers. Mr. W. H. Parry is an editor. Mr. W. J. Harris was an insurance manager before he became director of the Census. Only Mr. E. N. Hurley, a manufacturer from Illinois, has been dealing with things themselves. With all due respect to lawyers and with a naturally high regard for editors, we feel that this country would be better managed if more of the men in high places in the government had had the experience of building bridges, operating mines, managing stores, and, in general, taking part at first hand in the development of the country. This, we think, especially important in such a delicate matter as trade regulation. Such men are not appointed to office because, usually they are too busy minding their own business to think of the matter. Then, too, there is rarely any organized effort to present the claims of a business man to office, and no insistent public demand that in making appointments, choice be made from their ranks. This we think a national danger.

LOOKING FORWARD

A movement which so experienced and hard headed a mining engineer as Mr. John Hays Hammond considers "one of the most promising things that I have seen in connection with modern industry," and which enlists the active interest of such men as Mr. Elbert H. Gary, Mr. J. A. Holmes, Mr. J. Parke Channing, and others of like standing, is one well worth investigating. At the recent New York meeting of the American Institute of Mining Engineers, Mr. Channing told briefly of the organization, methods, and results of the 'Industrial Service Movement' with which readers of the *Press* are already somewhat in touch through the article by Mr. Fred H. Rindge, Jr., in our issue of November 7. Mr. Channing, who is a member of the advisory committee in charge and who is much more directly responsible for the impetus the movement has attained than his modest paper would indicate, gave, among others, the following interesting details:

"These days of great industrial and social problems in America produce many suggested solutions and great changes. The practical engineer and employer of labor views these problems differently from the labor leader or the social reformer, but as never before he is sincerely interested in solving them in a way that will be just to all. The very centre of final success in improving conditions and increasing the efficiency of workingmen must be the spirit of fairness and a knowledge on the part of the employer of how to deal sympathetically and intelligently with his employees. Every progressive employer knows how greatly he desires foremen, superintendents, managers, and others who possess these qualities. On the other hand, all are familiar with serious mistakes made by young graduates of engineering schools who have had no opportunity to develop these qualities, and who have no real appreciation of the worth of the workers. Indeed, one wonders whether much ill-feeling, labor difficulties, and many strikes could not be avoided if such men had the right attitude.

"How can it be done? For seven years a movement has been making rapid progress in engineering schools with the purpose of helping to solve this very problem. It was started at Yale in 1907, by the Young Men's Christian Association, when some engineering students were led to get in touch with workingmen and boys in New Haven. The idea was to render service by teaching them English and other subjects and in turn learn their ways, ideas, customs, and how to deal with them intelligently. Friendly, mutually helpful personal contact was the basic principle. This was the beginning. Do not confuse it with 'social service'—it was this, and much more. The reaction on the engineer was the main object sought. The idea worked out so successfully that a number of men saw great possibilities in it, and the whole conception was greatly enlarged. During the past year 3500 students from 200 colleges have engaged regularly in industrial service. Experience proves that men interested in this work at college go out into the larger world with a new vision and a new attitude and sense of responsibility. It may seem surprising that 3500 engineering students, each carrying a heavy course of study and with many other interests, can find an evening or two each week to engage in some form of definite service, without any financial compensation. But such is the case, and on the whole a careful survey of their work reveals efficiency and permanency in a high degree. If industrial men are at first suspicious, their suspicion soon wears away in the face of frankness and friendliness. If the employer has any doubts, they do not last long.

"But what has this to do with engineering? Just this—that every one of these 3500 students would be willing to say that he has gained far more than he has given. Furthermore, a study of the situation proves that he has gained in a large measure the very qualities he needs—an appreciation of workingmen, adaptability, leadership, a knowledge of how to deal with men in a way to get results and to avoid harmful labor difficulties. In general, he learns that all men are men, regardless of race, nationality, color, or creed, but that men must be dealt with very differently; he learns that it pays to win the leaders of men if one desires to win the men themselves; that the work, home, and leisure life of industrial workers play a large part in determining efficiency; that a man's working associates may largely influence the quality of work he does; that helping men to concentrate on their work (though not at the expense of mental and physical welfare) increases output; that friendly competition (without driving men) helps break records; that reasonable relaxation and recreation pays both from the human and economic standpoints; that visitation of other plants and stimulation of new ideas in various ways may mean a money saving to the company; that the loyalty of the men is one of the employer's greatest assets; and that character counts most of all. More than this, he learns to understand men, he learns how to sympathize with the other fellow's point of view and how to handle men successfully. Is this not worth while? Who can foresee what the future will hold for these men in the way of opportunities and responsibilities?

"Let me illustrate. One engineering student apparently never took any interest in anyone but himself until he was enlisted in some of this work. Two evenings each week he walked two miles to teach a class of 20 coal miners. The miners learned a great deal, but they little realized how much they were teaching the college man. His whole viewpoint was gradually changed. He learned to appreciate that all men were men, and he graduated from college with a new vision and a new sense of responsibility. He had not become a sentimental idealist. He perhaps realized the weaknesses of workingmen better than ever, but he had come to know their good points as well, and he had developed a real point of contact. It was therefore not surprising to receive a letter from him recently, indicating his growing interest and telling enthusiastically of his success with a welfare clubhouse."

New York Meeting American Institute Mining Engineers

The annual meeting of the American Institute of Mining Engineers in New York was opened on Monday, February 15, by a discussion of papers on safety and sanitation, which was presided over by Arthur Williams, chairman of the committee on safety and sanitation. The first paper was on safeguarding the use of mining machinery, and was presented in abstract by its author, Frank H. Kneeland. Howard N. Eavenson then described the safety methods and organization of the United States Coal & Coke Co. in an extremely interesting manner. Several of those present joined in the discussion which followed. J. Parke Channing called attention to the improvement shown by the operating forces of Russian coal mines since the sale of vodka has been prohibited, 70% of the regular operating force now producing 130% of the normal output. C. W. Goodale described the gratifying progress which has been made in decreasing the number of accidents in the mines of the Anaconda C. M. Co. He also pointed out that the method of reporting accidents as one for so many tons mined is satisfactory for coal mining, where but little work is done except mining coal, but in metal mines, where much of the work underground is unproductive, a more satisfactory basis is that of reporting accidents as one for so many shifts worked. G. S. Rice also touched on this point, and B. F. Tillson drew attention to some points of interest in the safety work at Franklin Furnace, New Jersey. S. Le Fevre next presented a paper on housing and sanitation at the mines of Wetherbee, Sherman & Co., at Mineville, New York, which was illustrated by a moving picture film taken by the U. S. Bureau of Mines at Mineville. J. Parke Channing presented a discussion of possible methods of enlarging the worth of the worker and the perspective of the employer through utilizing the facilities of the International Young Men's Christian Association. F. H. Rindge, Jr., who is in charge of this branch of the Y. M. C. A. work, supplemented this paper with a brief account of the way in which the Y. M. C. A. organization, through its hold on undergraduate college men, is able to enlist their energies in work to benefit employees in industry. H. H. Stoek told how this work at the University of Illinois has grown until the University asked for an appropriation of $50,000 for 1915, hoping if the sum becomes available to put a night school in every important town in the state. S. A. Taylor told of his experience with schools for workers in which it was found that the men would not travel considerable distances to a central school on Saturday afternoon, even though the company paid them their regular wages. An effort was therefore made to take the schools to the miners, and this was found entirely successful. Any convenient hall where ten or a dozen workers could be gathered was used, and by the aid of a balopticon, advertisements cut from technical journals were thrown directly on the screen while the instructor explained the construction and use of the equipment. In this way much useful information was gained by the men, and in addition they were kept out of the saloons and bar-rooms. The morning session was concluded by a paper on some factors in the cost of coal mining, by Gregory. This was originally scheduled for presentation at a later session, but was introduced at this point because it bore in part on safety measures. This prolonged the session over an hour beyond the set time, and served to demonstrate the unwisdom of such a proceeding, for the author was put out of his stride by the restlessness of his audience, and the time which had been allotted for committee meetings and the safety exhibit on the sixth floor of the Engineering building was taken up by the session.

The annual meeting was scheduled for Tuesday, the date fixed by the constitution for the annual business session, but it proved that this would bring the annual dinner on Ash Wednesday, so the date was advanced. In spite of this the attendance at the first session was surprisingly large, and at the luncheon served at 1 o'clock so many more than had been provided for were present that many of the members had to adjourn to the Engineers' Club. The Chemists, Columbia University, Harvard, Machinery, Princeton, Rocky Mountain, Technology, Williams, and Yale Clubs had all extended their privileges to visiting members during the meeting, so that there was no lack of places to go. The ladies, who were present in good numbers at the luncheon, were taken after lunch to hear a demonstration of a new player piano, and afterward to a 'dansant' at the Biltmore hotel, to which only two of the men had the courage to venture.

During the afternoon, two sessions were held simultaneously, that on non-metallic minerals being presided over by Heinrich Ries, and that on iron and steel by Albert Sauveur.

In the non-metallic session, J. Sharshall Grasty presented a paper by himself and T. L. Watson, on the barite deposits of the Appalachian states. C. H. MacDowell, president of the Armour Fertilizer Co., discussed in detail the various sources of potash supply which have been suggested, concluding that none of them offered much promise except the brines of California and the feldspars of the eastern states, making the pertinent observation that no sources of potash can be developed without some one being willing to spend money in considerable amounts. W. B. Phillips described his investigations of possible sources of potash, concluding that only along the New Mexico border are there any of promise. N. B. Davis next discussed the plasticity of clays, and J. H. Watkins described the white-burning clays of the southern Appalachian states. J. H. Pratt discussed the minerals used in the manufacture of lighting apparatus, and E. G. Norton the origin of the Louisiana and east Texas salines.

The annual business session was held the following

morning at 10 o'clock, when it was announced that the regularly nominated officers had been elected, as announced last week. The officers and various committees made the usual reports, among them the committee on increase of membership which reported that 1006 men had been elected to membership in the Institute during the year, and that the organization now has over 5000 members in good standing for the first time in its history. It was also announced that all three of the amendments proposed had been carried by over 600 majority, and it is interesting to note that as many members voted on the amendments as for officers.

Of the papers the following session, the one which attracted the most interest was the description of the Boulder Batholith of Montana, by Paul Billingsley. H. V. Winchell, L. C. Graton, and others joined in the discussion of this, and it was the general impression of all present that R. H. Sales and his associated workers have set a new and higher standard of geological work. At noon the Michigan College of Mines alumni held a luncheon at the Engineers' Club, while the other members lunched in the Engineering building as before. Following luncheon the ladies departed for the Metropolitan Museum, and a session on coal and petroleum was held, over which A. F. Lucas presided. C. T. Malcolmson described recent developments in coal briquetting, and E. W. Parker so heartily commended the use of briquettes that he was subject to good natured inquiries as to whether Mr. Malcolmson had sent him a carload. W. S. Ayres pointed out that in eastern Pennsylvania the production already exceeds the market, ascribing this to the fact that the binder gives rise to a heavy acrid smoke that is a source of much annoyance to neighbors, no matter how satisfactory the user found them.

The annual dinner was held at Hotel Astor, Tuesday evening, February 16, and was unusually well attended. At 6:30 p.m. there was a reception to the newly elected president and the retiring president in the reception room of the hotel. At 7 p.m., following the reception, the subscription dinner was served in the banquet hall. At 9 p.m., at the close of the dinner, the retiring president, Mr. Thayer, introduced the newly elected president, Mr. W. L. Saunders.

Mr. Saunders remarks were as follows:

"It is such an easy thing to get a swelled head, that I am not at all concerned about my capacity to fill President Thayer's hat: but the thing that worries me is how shall I ever acquire a large enough understanding to even look respectable in his shoes? So that if there are any here who kick against the new administration, I trust they will bear in mind that even success should have its consolations.

"It is a great satisfaction to follow a great man; to have a big job passed over to you with the statement, 'We older men must make way for younger blood; my boy, I wish you the same happiness and success that I have always enjoyed, etc.' That satisfaction becomes a condition of calm content when, as in this case, it is found that the old ship has been refitted from topmast to keel; that all the barnacles have been removed; that she is now staunch and strong, a goodly vessel, and that the captain is in reality only a watch officer whose highest aim should be to keep off the rock and up to the standard.

"In paying to my distinguished predecessor the tribute of my admiration and my tears, I must differ from him only in one thing. Actuated, I have no doubt, by his natural modesty and kind heart, he has told those who have expressed sorrow at his going out of the presidency that they would get a better man. Ah, no, no Mr. Thayer, not at all, not at all. Why that is exactly what your predecessor Mr. Rand said. I repeat, even success needs its consolations, and if the measure of the volume of our consolation is to be the extent of success achieved, then Ben Thayer should be truly overwhelmed. His administration of the affairs of this Institute has been one continued success.

> Born for success he seemed,
> With grace to win, with heart to hold.

"I wish that we might have kept him in office indefinitely, for he is an inspiration. He has done many things for the Institute, but it will always be remembered that under President Thayer the membership passed beyond the five thousand mark and that every dollar of a large indebtedness was canceled.

"For my part, words are but idle thanks in expressing my feelings. I realize that it is no easy task to keep up the pace which has been set, but the confidence implied by your act in so greatly honoring me will, I trust, serve to strengthen and sustain me.

"With this as a staff, and through the valued aid which will be given by the Executive Committee and the Directors, let us hope that the Institute and the great mining industry which it represents will press onward in continued prosperity and usefulness."

The other speakers were Messrs. Benjamin B. Thayer, Gano Dunn, Job E. Hedges, Dr. Rossiter W. Raymond, and John C. Montgomery. Dr. Raymond spoke of Job the early miner, and various speakers called attention to the fact that Job, in the person of Mr. Hedges, was still active in mining. The whole affair was carried out in excellent style and the evening was thoroughly enjoyed. The members and guests present were as follows:

PROGRAM COMMITTEE
George C. Stone, chairman

R. M. Catlin	James F. Kemp
John V. N. Dorr	Joseph W. Richards
L. C. Graton	Bradley Stoughton
J. E. Johnson, Jr.	

Among the papers read and discussed at the meeting were a number previously printed in the *Bulletin* of the Institute, several of which have been previously noted in the *Press*. Others were presented in pamphlet edition to those attending the meeting. Among these papers may be listed:

ENLARGING THE WORTH OF THE WORKER AND THE PERSPECTIVE OF THE EMPLOYER, by *J. Parke Channing.*

HOUSING AND SANITATION AT MINEVILLE, by *S. Le Fevre.*

SAFEGUARDING THE USE OF MINING MACHINERY, by *Frank H. Kneeland.*

SAFETY METHODS AND ORGANIZATION OF UNITED STATES COAL & COKE CO., by *Howard N. Eavenson.*

GERMAN AND OTHER SOURCES OF POTASH SUPPLY, by *Charles H. MacDowell.*

INVESTIGATION OF SOURCES OF POTASH IN TEXAS, by *William B. Phillips.*

THE PLASTICITY OF CLAY IN RELATION TO MODE OF ORIGIN, by *N. B. Davis.*

BARITE IN THE APPALACHIAN STATES, by *Thomas L. Watson* and *J. Skarshall Grasty.*

WHITE-BURNING CLAYS OF THE SOUTHERN APPALACHIAN STATES, by *Joel H. Watkins.*

COMPARATIVE COSTS OF ROTARY AND STANDARD DRILLING, by *M. L. Requa.*

IMPROVED METHODS OF DEEP DRILLING IN THE COALINGA OIL-FIELD, CALIFORNIA, by *M. E. Lombardi.*

THE PETROLEUM FIELDS OF ALASKA, by *Alfred H. Brooks.*

THE USE OF MUD-LADEN WATER IN DRILLING WELLS, by *I. N. Knapp.*

THE RÔLE AND FATE OF THE CONNATE WATER IN OIL AND GAS SANDS, by *Roswell H. Johnson.*

OIL AND GAS POSSIBILITIES, by *F. Julius Fohs.*

THE ESTIMATION OF OIL RESERVES, by *Chester W. Washburne.*

THE DEHYDRATING OIL PLANT OF NEVADA PETROLEUM CO., CALIFORNIA, by *S. J. Hardison.*

A MODERN ROTARY DRILL, by *Howard R. Hughes.*

RECENT DEVELOPMENTS IN COAL BRIQUETTING, by *Charles T. Malcolmson.*

THE MINING AND REDUCTION OF QUICKSILVER ORE AT THE OCEANIC MINE, CAMBRIA, CALIFORNIA, by *C. A. Heberlein.*

METALLURGICAL PRACTICE IN THE PORCUPINE DISTRICT, by *Noel Cunningham.*

METHODS FOR THE DETERMINATION OF GOLD AND SILVER IN CYANIDE SOLUTIONS, by *L. H. Bahney.*

The list includes, as indicated by the detailed account of the sessions, only a part of the papers presented, but it is none the less a notable one. Especially is this true of the papers on petroleum, not that these were especially fundamental or revolutionary, but they were broad in scope, sound in technology, and they afford striking evidence of the good effect of the organization of a special petroleum committee in the Institute. Gas and oil production have too long lagged behind other branches of mining in the development of good technology through the medium of free exchange of data among engineers.

Gold Mining in Victoria, Australia

The gold output for the year 1914 (413,288 oz.) shows a considerable falling off compared with the yield for the two preceding years. No one has to search far for the reason, according to *The Australasian*, the leading weekly. Dividends have shrunk largely, and as a consequence there is not the same flow of capital into the industry. The returns from Bendigo, for instance, furnish an explanation of the shrinkage. There deep mines

DISCHARGE FROM PUMPS AT A VICTORIAN DEEP-LEAD MINE.

have failed to respond to the expenditure, and they have had to be closed down, or work on a small scale was concentrated on the ore occurrence in the upper levels of the mines. No really extensive scheme of development is being carried on, either on the side lines or in the districts surrounding Bendigo. Of these, Castlemaine should provide a field for prospecting. As at Bendigo, gold was rich at the surface, or in the shallow lodes, but so far deeper work has failed to repeat the experience of Bendigo in sinking for new saddle formations. There are 'leads' near Bendigo, also, that deserve attention. At Ballarat, mining on the plateau seems practically to have come to a standstill, owing to several causes. Until some developments are made, either in new or known centres, or work on some of the partly opened or untouched deep leads proves attractive, Victoria must rely for its gold output on the old mines. The Langi Logan deep lead property is now supplying 'wash' for treatment.

Dredging for Platinum in the Kytlim Valley, Russia

By R. S. BOTSFORD

For more than 15 years, 2 of the 3½ miles of the Kytlim valley, in the Ural mountains, has been worked by means of a bedrock tunnel. Last year's production was 640 lb. of crude platinum from this part of the estate alone.

Horses and carts were used in the lower part of the valley for removing the overburden and delivering the gravel to the various central washing-plants conveniently situated.

When the ground was found to be deeper half-way up the valley, shafts were started and *starateli*, or tributers, were put to work, more than 100 different shafts being opened at one time, with a population of over 2000 working the alluvial diggings.

The tributers leave about half the ground, digging only that part which they consider the richest and sufficiently drained in proximity to the bedrock tunnels; in fact, what they can work economically at the price they receive for the platinum from the Company.

My investigation has shown that it is desirable to employ a dredge to dig all the deposit, including the considerable amount of platinum in the overburden.

The Kytlim river empties into the Lobva, and for three miles the latter also has proved to be good dredging ground. An unsuccessful attempt had been made to divert the river, but the water proved too much, and the Lobva still remained untouched. A Putiloff 5½-ft. steam dredge with steel pontoon is now operating at a profit on the Lobva, and a modern 7½-ft. Marion electric dredge is being completed in the Kytlim valley. There is room for two more dredges on the 25,000,000 yd. of tested ground on this part of the estate alone. Testing was done by shafts, drilling being entirely unsatisfactory on account of the character of the ground and distribution of the platinum. The source of the platinum is the Koswinski Carmen, a hill of pyroxenite enclosing a boss of dunite, the disintegration of which provides the platinum alluvium of the streams rising on it, and combining to flow down the Kytlim valley. This has been definitely proved by Professor Duparc of the Geneva University.

The ground allotted to the Marion dredge will require to be flooded, and the dredge has been constructed to dig 16 ft. above and 25 ft. below water-level. A monitor and sand-pump have been provided, as well as a long stacker, 145 ft. 6 in. over all, to deal with the high bank above water and the occasional shallow digging to be expected from the moderately steep creek-grade. In order to deal with the gritty clay in the gravel, high-pressure water is used in the revolving screen, the latter being of the retarding stepped type, 36 ft. long, with manganese steel longitudinal agitating bars. The platinum occurs in fine and medium rounded grains, permitting ¼-in. holes in the screen with the advantage of

PUTILOFF, 5½-FT. DREDGE, PAVDA ESTATE, STARTED JULY 1914.

ERECTING THE MARION 7½-CU. FT. DREDGE, SEPTEMBER 1914.

carrying more of the washed gravel over the elevator and much better recovery on the double bank of steel tables, provided with matting followed by carbon steel angle-riffles. The suction of the 8-in. Morris sand-pump is connected direct to the under side of the upper tail-sluices to avoid priming.

The heavy, 72 ft. long, digging-ladder is of the plate-girder type with a water-tight drip-trough under the

ERECTING THE MARION DREDGE.

ERECTION OF 25-TON STERN GANTRY.

buckets extending to the lower tumbler, and is supported on the heavy foundation-castings of the main drive, concentric with the upper tumbler shaft. The bucket-line consists of 62 manganese steel one piece buckets of 32-in. pitch. Each bucket weighs 2165 lb., and the manganese steel pins are 5½-in. diameter. The crane overhangs the deck 8 ft. on each side and covers a width of 22 ft. The whole dredge is controlled by one operator in the pilot-house.

The pontoon is of strong construction, 44 by 100 ft., 8½ ft. deep, with 3 ft. overhang on each side. The stern gantry is 77½ ft. above the deck, which consists of ¼-in. plate covered with 2-in. plank. The sides consist of ⅜ in. with ½-in. plate around the well-hole. The pontoon, frame, and gantries were built here, 50 miles from the end of the private railroad, material being cut and trimmed, bent, punched or drilled, and riveted on the spot. The workshop is run by an oil-engine. The excellent martin steel of the Ural mountains shows under test a breaking stress of 24 to 27½ tons per square inch.

The heating plant contains a 35-hp. boiler on the pontoon with pipes to radiators at various points and to the stacker, which is covered and steam-heated with pan under the total length of belt. The stacker-belt is 34 in. wide. The dredge-housing is constructed of double siding with tarred paper between, to keep the dredge warm in winter. The total displacement of the dredge is about 830 tons.

The electrical equipment consists of 11 motors working at 2000 volts, 50 phase, 25 cycles, supplied by the American General Electric Company.

	Hp.

PUMPS

10-in. Worthington, to tables, 3000 gal. per minute (constant speed)	50
12-in. Worthington volute, to screen and bucket spray, 4000 gal. per minute	100
3-in. priming pump, Worthington (constant speed)	15
8-in. Morris sand pump, motor (constant speed)	50
Giant-monitor, motor (constant speed)	50

The power is supplied by a 500-kva. De Laval turbo-generator set with a 600-hp. boiler, the current being transmitted at 10,000 volts. The central station is favorably situated as regards firewood on the Katechoram river, 3½ miles from the Marion dredge. The other dredges will be much closer to the station, which can be supplied with an ample amount of firewood for all likely requirements within a radius of 2 to 3 miles, all roads leading downhill to the station, thereby securing cheap haulage over the snow in winter.

The surface of the ground freezes with a normal amount of snow to a depth of 12 to 20 inches. The dredge starts at the lower end of the underground workings and a proper manipulation of the water feeding the dredging pond through the extensive warm workings should maintain the pond comparatively free from ice.

Testing Burned-Out Armatures

By LEONARD V. NEWTON

Where many electric motors are used in and about a mine for haulage and various other purposes, the electrical engineer is often called upon to test a burned-out armature and determine the coil or coils which are destroyed. The following is a description of a test which I have found to work admirably. The armature to be tested should first be mounted on a frame, so that it may easily be revolved. A stout string should then be wrapped around the commutator segments and securely tied. The current necessary in carrying out this test is small; therefore, if eight or ten 16-cp. incandescent lamps be connected in series, and the lead from one side of the lamp band be slipped under the cord around the commutator, and the lead from the other side of the lamp bands connected to the power-line, and the other side of the power-line connected to the commutator segments, say twenty segments apart, a current will pass through this portion of the armature. If then all these coils are perfect, the reading should be the same on a mili-voltmeter as the terminals are placed on adjacent commutator segments. If the mili-voltmeter shows an average reading, and then a low one, the coil giving the low reading is the burned-out coil. After testing the 20 segments, the power or current leads should be shifted to the next twenty until the entire commutator has been tested.

In practice, I have found that a switchboard ammeter, which is in reality a mili-voltmeter, serves admirably for the test. The theory of the test is as follows: the drop in voltage across a short-circuited coil is much less than through a coil that is not short-circuited, in as much as the drop in voltage through a big piece of copper is smaller than through a fine wire. Therefore, if there is any short-circuit in the armature, it is readily shown by the accompanying drop in voltage. The connections for the test are shown in the accompanying diagram.

FLINT PEBBLES worth $300,000 are imported each year into this country. According to Frank J. Katz, of the U. S. Geological Survey, the principal American localities at which flint pebbles have been noted in particular abundance are in Texas, Mississippi, Arkansas, and Missouri. One of these which is considered especially worthy of investigation, is the area of flint-bearing Cretaceous limestone in central Texas. Other kinds of tough silicious pebbles which are abundant in some parts of the United States are agate, carnelian, chalcedony, and petrified wood. Stream beds or shore beaches containing pebbles of this character should be searched.

THE Dominion Coal Co., Canada, production in 1914 was 4,287,150 tons, compared with 4,741,391 tons in 1913.

Misfires in Blasting and Their Causes

By J. B. BURGESS

Wherever high explosives are used, misfires or missed holes are a constant source of danger, expense, and annoyance. Many horrible accidents are caused through their detonation by tools in the hands of workmen. Valuable time is lost in searching for missed holes and in re-priming and firing them, and in waiting for the smoke to clear away before resuming work in the heading; to say nothing of the failure of a battery of holes to break its proper footage through the misfire of a leading hole. The causes and prevention of this kind of trouble are common subjects for earnest thought and discussion, participated in by everyone concerned, from 'mucker' to superintendent.

The Controlling Factors

The numerous elements involved in the preparation and blasting of a round of holes give many possibilities for unfavorable conditions, or defects in workmanship, any one of which may lead to a misfire. These elements may be enumerated as follows: nature of the ground; presence of ground-water; quality and grade of powder, fuse, and caps; temperature and dryness of powder; preparation of the fuse and cap; preparation and position of the primer; method of loading the hole; arrangement of exposed part of the fuse; and unavoidable circumstances.

All of these factors have been studied and made the subject of helpful and enlightening reports by various writers in the technical press, by the U. S. Bureau of Mines, and by the powder manufacturers; but it is my belief that there is room for further emphasis on the subject of care in the preparation of the fuse and cap. In the course of ten years' close observation of blasting conditions, involving daily inspection of newly blasted working faces, I have come to the conclusion that a large porportion of missed holes is caused by the failure of the cap to explode; and that this is the chief cause of the avoidable class of misfires, those that can be prevented by care on the part of the workmen. In this paper, therefore, I shall confine my remarks chiefly to that part of the subject.

The following definitions will be useful:

To 'spit' a fuse.—To ignite it, a common miner's term.

Flash.—The flashing of fire from the end of the fuse, opposite to that at which it was 'spit.'

Moderate crimping.—Crimping with a moderately firm grasp of the hand, not hard enough to bend the handles of the crimpers.

Hard crimping.—Crimping as hard as the strength of the crimpers will permit.

In the majority of instances of misfires that have come under my observation, where the fuse or primer was not cut off by the explosion of an adjacent hole, I have noticed that the fuse had burned as far down the hole as could be seen; and when the powder was exposed to view, it could be seen that the fuse had burned down into it. My courage and regard for my personal welfare was only occasionally equal to digging out the powder to see if the cap had exploded, but I did this in certain favorable instances, and have had my foreman bring me unexploded caps from missed holes when he found them. In a missed hole of this kind, it is rarely that I have found the cap to have exploded; and I have never found an unmutilated piece of fuse that had failed to burn to the end, even though it had been bent back upon itself for the purpose of inverting the cap in the primer, according to the questionable custom so often practised by miners. Almost invariably the fuse is found to have burned into the cap without exploding it. This fact puzzled me for a long time, but while the reason for the failure of the cap to explode cannot always be known with certainty, it can often be explained as the result of carelessness, or a wrong method of attaching the cap. Three particular instances of this kind are fresh in my mind. In one of these the cap had been crimped with the sharp point of a knife, which had been thrust so far into the side of the cap that it had penetrated to the train of powder in the fuse. I should hardly expect this to cause a misfire, but it is probable that the knife-hole made a way for the escape of fire from the fuse, and so weakened the flash that it did not ignite the fulminate. This was one misfire in a round of 15 shots. In another instance the cap had been crimped with a California crimper in an astonishing manner. It had been crimped hard more than half the length of the cap from the open end, so that the crimping extended ¼ in. over the fulminate. It had been turned ¼ over and crimped again in the same way. The cap, as found, presented a rather crushed or chewed up appearance. It is hard to believe that crimping over the fulminate could be done in this was as a regular practice without causing an accident. There were four misfires in this round of 18 holes. The important point to observe in this incident is that the tip of the fuse had been subjected to hard crimping, and this had caused the misfire, even though the end of the fuse had been cut off square and pushed into contact with the fulminate. In the third case the fuse had been cut at an angle of 45°, thrust into the cap up to the fulminate, and had been properly crimped with a California crimper. The reason for its failure to explode is not readily given, as the cap exploded when tested with another piece of fuse.

Experimental Results

In order to confirm the conclusions that I had arrived at through observation of practice, I recently made a series of experiments with fuse and caps, with the particular object of ascertaining how far it was necessary

to depart from the principles of good practice in order to cause misfires of the cap. In other words, I tried to find out how to produce misfires. I give the experiments in detail.

Experiments with Fuse

1. Fourteen feet of Bear brand fuse was laid along a board. The fuse was cut half way through at intervals of 2 ft., and then spit at one end, and rate of burning was timed for each 2 ft. A sharp puff of flame and smoke shot out from the knife-cuts as the fire passed them, enabling the time to be noted accurately. The time in seconds for 2-ft. lengths was as follows: 108, 92, 101, 101, 101, 105, 100, 109, 95, 101, 99, 98, 101, and 102. A second piece from another coil gave 97, 83, 92, 90, 90, 89, and 90. This experiment was to determine whether the rate of burning was uniform in each coil. As far as the experiment went, there was no indication of serious irregularity, and as there had been no complaints from the mine on this score, nor any observations on my part suggesting such a defect, no further tests were made.

2. Fifty feet of Bear brand fuse was stretched out along a steep bank, supported at irregular intervals on rocks, and ignited. It burned through uniformly. The strength of the fabric after burning was sufficient so the fuse did not break apart of its own weight.

3. Pieces of Bear brand fuse when twisted, kinked, and pulled in the hands, did not open up so as to expose the powder. The same result was observed when the fuse was used as pack cord and tied in knots by miners.

4. Fifty feet of fuse of foreign manufacture was stretched along a rocky slope and ignited as in experiment 2. It burned through uniformly, but fell apart in several places by its own weight after burning.

5. Pieces of foreign made fuse were twisted and kinked. They usually opened up badly and exposed the powder.

6. The following tests were made to determine the effect of pressure on rate of burning, the fuse being all taken from the same coil: (*a*) three pieces 12 in. long ignited—the time of burning was 52, 49, and 44 seconds; (*b*) two pieces 12 in. long were placed between the jaws of a 6-in. vise, so that 6 in. of fuse was strongly compressed, and 5 in. protruded beyond the jaws in the direction of burning—the time of burning was 44 and 45 seconds; (*c*) one piece 12 in. long was compressed in a vise, taken out, turned one quarter over and compressed again—the time of burning was 47 seconds. No appreciable change in rate due to pressure was observed, but in each trial the fuse exploded with a sharp snap as the fire emerged from the jaws of the vise, and blew a hole through the side of the fuse.

7. A piece of fuse was strongly gripped in the vise between two blocks of wood, ½ in. wide. The fuse was allowed to protrude ½ in. beyond the blocks in the direction of fire. The flash was more vigorous than in the case of loose fuse.

8. A piece of fuse was strongly gripped in a vise as in No. 7, but between an iron block on one side and a piece of hard belting leather on the other. The flash was vigorous as in No. 7.

9. Two pieces of fuse were gripped as in No. 8, but the end of the fuse was flush with edge of blocks, so that none protruded. The flash was very weak—not over ⅛ or ¼ in. beyond end of fuse.

10. Several pieces of fuse were gripped firmly at their extreme ends in jaws of California crimpers, and ignited at the other end. The flash was noticeably weaker than when burned without pressure. When the end of the fuse was crushed twice on opposite sides with the edges of the crimping surface of the crimpers and then held firmly in the crimpers, the flash was extremely weak, only a few sparks getting through, and these being feeble.

11. Several pieces of fuse were gripped strongly in crimpers so that ½ in. of fuse protruded. The flash was strong.

12. A piece of cold glass was held ½ in. from the end of the burning fuse. When the flash occurred, a considerable quantity of moisture was condensed on the glass.

Experiments with Caps

All caps, with the exception noted, were No. 8, made by the California Cap Co. All were crimped with a California crimper.

13. Number tested, 20; fuse cut square; end of fuse placed in loose contact with fulminate; crimped with one moderate pressure at end of cap. All exploded.

14. Number tested, 20; fuse cut square; end of fuse in loose contact with fulminate; crimped hard two widths of crimper, revolved quarter turn and crimped again. All exploded.

15. Number tested, 20; fuse cut square; end of fuse in contact with fulminate; crimped hard with edges of crimper so as to bruise fuse, and then crimped hard in the regular way for two widths of crimper; cap had battered appearance. All exploded.

16. Number tested, 20; fuse cut square; end of fuse ¼ in. from fulminate; crimped with one moderate pressure at end of cap. All exploded.

17. Number tested, 20; fuse cut square; end of fuse ¼ in. from fulminate; crimped hard with pressure, two widths of crimper, so that crimping extended to tip of fuse, revolved half over and crimped again. Nine missed fire.

18. Number tested, 20; fuse cut square; end of fuse ½ in. from fulminate; crimped with one moderate pressure at end of cap. All exploded.

19. Number tested, 20; fuse cut with long slant and end pushed firmly against fulminate; crimped with one moderate pressure at end of cap. All exploded.

20. Number tested, 20; fuse cut square; end of fuse in contact with fulminate; crimped with fuse cutters, making deeply indented groove around cap. All exploded.

21. Three caps with end of fuse ½ in. from fulmi-

nate were placed in snow and left several minutes before spitting. All exploded.

22. No. 5 caps; number tested, 50; fuse cut square and placed in loose contact with fulminate; crimped with one moderate pressure at end of cap. All exploded.

The results of these tests point definitely to the squeezing and crushing of the extreme end of the fuse inside the cap as certain to cause misfires. Experiments 1 to 5 showed nothing wrong with the fuse, although they were not conducted on a large enough scale to be considered an adequate test where a large quantity of fuse is under consideration.

Experiment 6 showed that pressure did not alter the rate of burning to any appreciable extent, and did not extinguish the fuse. The explosion at the point where the fuse left the vise is explained as the result of the constriction in the bore of the fuse. The powder train, while burning between the vise-jaws, was compelled to do so under an unusual pressure from the resulting gases, in order to force them through the constricted opening; and this pressure was sufficient to rupture the walls of the fuse as soon as it was unsupported by the vise. In No. 7 and 8 this pressure exerted itself in forcing the fire through the remaining half inch of fuse, and thereby increased the strength of the flash. Experiments 9 and 10 showed that the explosive force of the burning powder was greatly decreased when the fuse was under pressure, although as seen in No. 6, the rate of burning was not affected. When the fuse was under pressure to its extreme end, the flash was very weak. Experiments 7, 8, and 11 showed that ½ in. of uncompressed fuse lying beyond the area of pressure was sufficient to insure a strong flash.

Of the experiments with caps, No. 13, 14, 15, 20, and 22 showed perfect results in all cases where the end of the fuse was cut square and placed in loose contact with the fulminate, even when the crimping was unnecessarily severe. It is noteworthy that no experiment was made with the fuse in contact with the fulminate and the cap crimped to the tip of the fuse, as this would have involved danger of accidental explosion of the fulminate in the crimping process.

No. 16 and 18 gave perfect results with the end of the fuse ¼ and ½ in. from the fulminate, although it is conceivable that with weak fuse misfires might occur from this practice if it were followed regularly.

No. 17, considered in connection with No. 9 and 10, indicates the possibility of misfires that can easily occur in practice, and one that would hardly be suspected without a special investigation. The experiments show that pressure at the tip of the fuse, especially if it be applied several times and from different directions so as to roll or crush the fuse and disarrange the powder train, decidedly weakens the flash, to such an extent that when the end of the fuse was ¼ in. from the fulminate it caused nine misfires out of 20. In contrast to this, with moderate crimping, all of 20 trials were successful when the end of the fuse was ½ in. from the fulminate. The incident of careless crimping that I mentioned, with its four misfires out of 18 loaded holes, was doubtless of this nature, and was due to crushing and crimping the fuse at its tip, as shown by an investigation of the single cap recovered after soaking it in water. Considerations of caution prevented me from carrying my investigation to the extent that my ex-employee did.

Experiment 19 failed to produce any misfires, although the practice of cutting the fuse with a long slant is commonly regarded as a cause of misfires, and cannot be recommended. The experiment was made in cold weather. Probably if the fuse were warm, the slanting end would show a greater tendency to curl over when pressed against the fulminate and thus prevent the flash from striking the fulminate. It is also probable that the chance of misfires from hard crimping would be increased with warm fuse, because it would then be softer and more easily crushed.

Experiment 21 was made to test the possibility of misfires being caused by the condensation of moisture in the flash (experiment 12) on the cold fulminate, so as to prevent its explosion, but the result was negative.

I realize that to make experiments of this kind conclusive as to the proportion of missed holes caused by the different methods of attaching the cap to the fuse, it would be necessary greatly to increase the number of tests; but, as I stated before, my object was rather to test the conclusions formed by observations made under working conditions, and incidentally to learn anything new that might come up; and the number of trials was sufficient for this purpose. As I hoped, they showed up the ease with which misfires could be caused by a slight variation from the commonly approved method of attaching fuse and cap.

Summary of Conclusions

To summarize my conclusions, I would make the following recommendations:

1. Cut the fuse square, with an instrument that does not mash the end, such as a sharp knife, a pair of sheep shears, or, best of all, a broad, thin, sharp chisel used with a mallet.

2. Insert the fuse into the cap until the end is in loose contact with the fulminate.

3. Use the California crimper (broad type), giving the cap one firm squeeze close to the open end. If working where there is water in the holes, protect the cap from dampness by applying grease or tar.

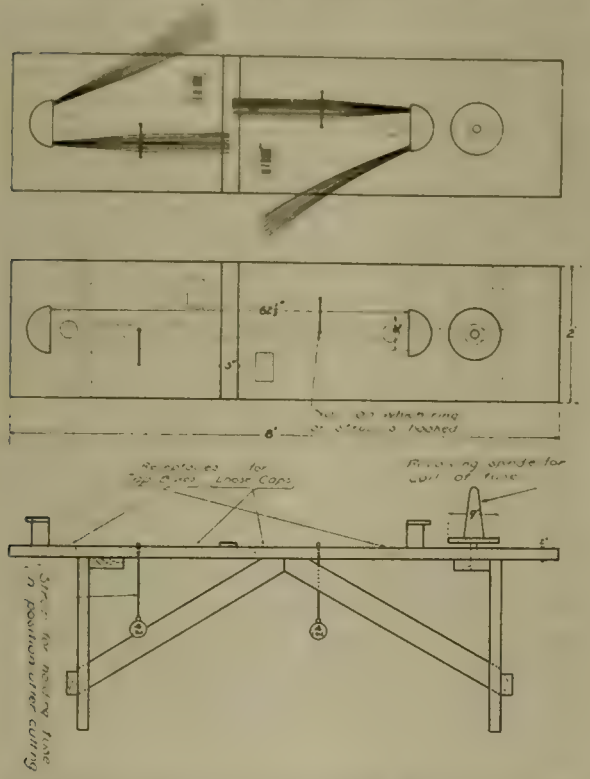
4. Particularly avoid crimping the cap over the tip of the fuse. Always leave ¼ to ½ in. of uncrimped fuse at the end.

5. If possible, have one reliable man trained to prepare all the fuse for the mine (according to the size of the mine).

Previous to making this investigation I had been bothered with an undue number of misfires in the mine. Each miner had been allowed to prepare his own fuse and caps, but on adopting the system of having all the fuse and caps prepared by one man, the misfires were

almost eliminated. Where the magnitude of the operations permits, it is well to take the further step of instituting the blasting crew system. With any system some misfires will happen, but with care they need not occur so often as to call attention to themselves by their frequency.

A convenient fuse-cutting table is shown in the drawing. The distance between the semicircular blocks can be arranged for cutting any length of fuse desired, but the dimensions shown are for six-foot fuse. The three-



FUSE-CUTTING TABLE. THE UPPER FIGURE SHOWS FUSE AFTER CUTTING AND READY FOR ATTACHING THE CAPS.

inch strip across the table midway between the semicircular blocks serves as a cutting-block when cutting the fuse with a chisel. The upper sketch shows the cut fuse ready for attaching the caps. The use of this table offers an opportunity for the introduction of efficiency principles. For the fastest work the caps are laid in the cap receptacle, with their open ends toward the fuse. They are then in a convenient position to be quickly slipped on the fuse. The caps are all put on the fuse before the crimping is done.

Water in Pennsylvania Anthracite Mines

The quantity of water that must be pumped and hoisted from these mines has increased nearly 10% in the past 10 years, and will continue to increase, making the mining of anthracite more expensive. It has been computed that every ton of coal removed from the mines involves the removal of a ton of water every year thereafter, until the mine and all workings connected with it are worked out or abandoned. In 1904 there were 846 pumps underground, and in 1914 they were increased to 929, besides water hoists. Water delivered at the surface in these years was 446,120 and 489,600 gal. per minute, respectively.

Moving a Shovel Up and Down Grades*

In moving a shovel any distance across country, especially where grades are encountered, it is safe to say that it takes twice as long with the boom up as with the boom down. When an engineer attempts to move the shovel with the boom up, the centre of gravity is high, and when there is any settling or unevenness of the track, there is a great likelihood that the shovel will turn over. With the boom down, on the other hand, there is a better distribution of the weight, consequently less blocking is required under the track, and it is not necessary to shim the track so carefully, as it does not have to be so level in order to make conditions safe.

The best way is to drop the boom on a truck or on a four or five-yard car, having the centre of the boom supported on the truck or car. The end of the boom, of course, is meanwhile resting on the boom step. Tie the boom to the circle with chains running from the circle brace clevises to the clevises on the sides of the boom; take the hoisting chain off the drum and drop it on the circle; take out the front car coupler so as to get a clear lead ahead; then run a cable on the drum and lead the cable ahead. A stake or stump will pull out with much ease, consequently the end of the cable should be fastened to a 'dead-man.' This should preferably be a heavy piece of timber 10 to 12 ft. long, dropped into a pit dug for it at right angles to the direction in which the shovel is traveling. A ditch should be dug out of the pit leading toward the shovel, so as to provide clearance for the cable which is attached to the centre of the timber. The timber is held in the pit by driving rails or pieces of timbers crosswise over it into the sides of the pit. The dipper and handle may either be hauled independently in a wagon by horses, or in a truck attached to the end of the shovel. This last method is the more satisfactory, as the loading process is easier.

In going down hill, the cable may be led under the shovel and anchored, as before, to a 'dead-man.' The shovel may then be lowered under perfect control by simply manipulating the hoisting brake. In climbing over steep short hills, it has been found more satisfactory to use the hoisting chain instead of the cable, because in cases such as this the strain is often too great for an ordinary sized cable.

ANTHRACITE COAL shipped to market during January totaled 5,175,732 tons, much of which was from storage yards.

*Abstract from *The Excavating Engineer.*

Improvements at the Reduction Works of the Anaconda Copper Company

*When John D. Ryan and B. B. Thayer were at Butte last December the important announcement was made that about $6,000,000 would be expended by the Company in improvements at the reduction works at Anaconda and Great Falls. These improvements are expected to result in considerable savings in metal and operation costs, and will permit the Company to work a lower grade of ore than has hitherto been possible, and will thus result in a considerable prolongation of the life of the mines.

At the present time the recovery made on the ore sent to Anaconda and Great Falls is only about 78% of the copper content. It is expected to raise this recovery to about 91% by the use of the flotation process on the material which now leaves the concentrator. This will require radical changes in the lower part of the mill. The upper portion will remain much the same as it is now, except that a Symons disc crusher will be added in each section in order to obtain increased crusher capacity. By so doing, the capacity of the concentrator will be increased from about 12,500 tons per day to 15,000 tons per day. The jigs on the roll and Huntington mill floors will be replaced by roughing tables of a special design which will make concentrate and coarse tailing. The tailing will be reground in pebble mills, so that it will pass a screen with about 60 holes to the lineal inch. This finely ground sand will then go to the flotation machines, which will be situated on the lower table floor and which will make a concentrate containing about 8% of copper and a tailing of only about 0.1% copper. The slime which is now treated on round tables will be further treated in flotation machines, making a tailing which can go to waste and concentrate which will go to the filter plant.

Under the new system there will be no first-class ore and all of the ore from the mines will go to the concentrator instead of being partly sent to the blast-furnaces. No coarse concentrate will be produced, and the field of the blast-furnaces will be greatly restricted, if the latter are not entirely eliminated. In order to take care of all of the concentrate which has been going to the blast-furnaces, as well as the concentrate which results from the treatment of first-class ore and from the increased recovery, a new roaster plant will be constructed containing 40 furnaces of 22 ft. 6 in. diameter. These furnaces will be charged by a conveyor system instead of by cars as are the furnaces in the old roasting plant. The calcine from this plant, as well as from the old roasting plant, will be hauled by the present tramming system to the present reverberatory plant. The furnaces in this plant are all being enlarged and equipped with pulverized coal burners. The new furnaces will be 25 ft. wide by almost 150 ft. long and will smelt about 650 tons per day each. The present reverberatory buildings will therefore house furnaces having an aggregate capacity almost two and a half times as great as before, and will smelt all of the concentrate coming from both roasting plants.

The barrel-shaped converters in the converter plant are being replaced by large upright converters of the Great Falls type about 20 ft. diameter. There will be seven of these converters, and they will be able to produce about 22,000,000 lb. of copper per month. The slag from these converters, which is now being solidified and resmelted in the blast-furnaces, will be tapped into large ladles and poured from these directly into a huge reverberatory which will be constructed in the relining department of the converter plant. This furnace will be by far the largest reverberatory in the world, and will be 25 ft. wide by 175 ft. long. It will receive about 700 tons of molten converter slag and 350 tons of fine ore per day. The furnace will clean the converter slag to such an extent that it may run to waste.

The new plant will be partly supplied with air from a turbo blower having a capacity of about 35,000 cu. ft. of free air per minute. This blower is direct connected to a steam turbine and runs at about 3400 r.p.m. It is now in operation and has proved highly successful. The blast-furnace and the briquetting plants will, under the new system, be no longer required, but will be kept intact and in good repair, so that they may be used in emergencies or at times when the price of copper is high and it may be advisable to push the copper output beyond the maximum capacity of the other departments.

The improvements at Anaconda will cost about $4,000,000. At Great Falls about $1,750,000 will be spent. A new refinery is being constructed at Great Falls which will have a capacity of 10,000,000 lb. of copper per month. It will replace the old refinery which has been in operation a great many years and which is no longer economical. The new plant will, however, have twice the capacity of the old plant. The refinery will be kept in operation, partly or entirely, on copper shipped from Anaconda, depending on whether or not the Great Falls smelter is in operation. The new smelter at Great Falls will be completed and the pulverized coal system, which has proved so successful at Anaconda, will be applied to the Great Falls furnace. Coal from the Lochray coalfields is to be burned. The ash content of this coal is high, but this has not proved detrimental. Both the output per furnace and the tonnage smelted per ton of coal will be greatly increased over the old system of gas firing. No concentration of ore will be done at Great Falls. All of the ore will come to Anaconda and concentrate only will be shipped from there. The blast-furnace department at Great Falls

*Abstract from *The Anode*, February 1915.

will also be closed, and all smelting will be done in reverberatories, as at Anaconda.

The new leaching plant at Anaconda, which will be operated on tailing that has accumulated during the past years to such an extent that about 15,000,000 tons is available for re-treatment, is nearing completion, and will probably be started early in April. It will treat from 2000 to 2500 tons per day of tailing containing from 13 to 14 lb. of copper per ton, and will make from 600,000 to 700,000 lb. of copper per month at low cost. The supply of tailing for this plant is sufficient to keep it in operation for a period of about twenty years.

The new acid plant is also nearing completion and will be able to make somewhat over 100 tons of acid per day. This acid will be used in the leaching plant and in the new flotation plants.

The Company has much experimental work under way along various lines, which may in the course of a few years lead to the establishment of other important lines of industry at Anaconda and other points.

Placer Mining Claims in the Yukon

By J. A. MacDONALD

In accordance with the terms of the Yukon placer mining act, 'mining' or 'placer mining' includes every mode and method of working whereby earth, soil, gravel, or cement may be removed, washed, shifted, or refined or otherwise dealt with, for the purpose of obtaining gold or such other minerals or stones, but does not include the working of rock *in situ*.

Size and form of claims.—A claim on a creek must not exceed 500 ft. in length, measured along the base line of the creek, established or to be established by a government survey. The rear boundaries of the claim are made parallel to the base line, and are defined by measuring 1000 ft. on each side of such base line. In the event of the base line not being established, the claim may be staked along the general direction of the valley of the creek. Claims situated elsewhere than on a creek shall not exceed 500 ft. in length parallel to the base line of the creek toward which it fronts by 1000 ft. A claim fronting on a creek or river is staked as nearly as possible parallel to the general direction of the valley of the creek or river, and conforms to the boundaries which the base line, when established, defines. Claims are measured horizontally irrespective of inequalities on the surface of the ground. The official survey which establishes the base of a creek or river at the same time establishes the side lines of claims located on the creek or river, and is final as to the location of such base line and side lines.

A creek claim must be as nearly as possible rectangular in form, and must be marked by two legal posts firmly fixed in the ground on the base line at each end of the claim; claims situated elsewhere than on a creek must be as nearly as possible rectangular in form and must be marked by two legal posts firmly fixed in the ground in a line parallel to the base line, and on the side nearest to the creek or river toward which it fronts. The line between the two posts is to be well cut out so that one post may, if the nature of the surface will permit, be seen from the other. One of the flattened sides of each post shall face the claim, and on each post shall be written, on the side facing the claim, a legible notice stating the name or number of the claim, or both if possible, its length in feet, the date when staked, and the full Christian and surname of the locator. The posts are numbered 1 and 2, respectively, and it is not lawful to move them, except that No. 2 may be moved by a Dominion land surveyor if the distance between the posts exceeds the length prescribed by the Yukon placer mining act, but not otherwise.

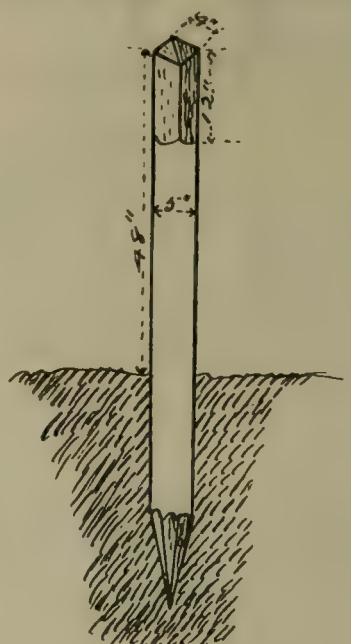


FIG. 1. LEGAL POST.

A legal post must be a stake having a diameter throughout of not less than five inches, standing not less than four feet above the ground, and flattened on two sides for at least one foot from the top, each of the sides so flattened measuring at least four inches across the face, and includes also any stump or tree cut off and flattened or faced to the aforesaid height and size. Any person or party of persons locating the first claim on any creek, hill, bench, bar, or plain, or locating a claim on any creek, hill, bench, bar, or plain upon which there is no recorded claim, is entitled to a

claim or claims respectively of the following size, namely: one locator, one claim 1500 ft. in length; a party of two locators, two claims, each of 1250 ft. in length; a party of more than two locators, two claims, each of 1000 ft. in length, and for each member of the party beyond two, a claim of the ordinary size only.

The boundaries of any claim in the Yukon, by order of the gold commissioner or mining recorder, upon application by the owner, may be enlarged to the size of a claim allowed by the act if such an enlargement will

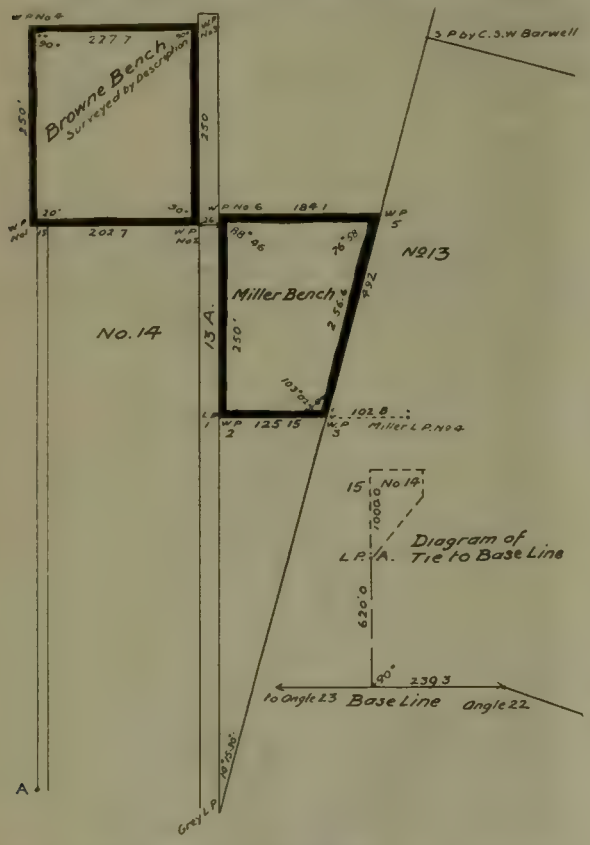

FIG. 2. BENCH CLAIM ON HUNKER CREEK. THE IMPORTANCE OF ACCURATE SURVEYS MAY BE INFERRED FROM THE FACT THAT ONE CLAIM 100 FT. SQUARE HAS YIELDED $80,000.

not interfere with any mining property which is owned by any other person or which is subject to the terms of an agreement with the Crown.

Locating and recording.—An application for a grant of a claim must be filed with the mining recorder within ten days after the location thereof, if it is located within ten miles of the mining recorder's office. One extra day is allowed for every additional ten miles or fraction thereof. The location of a claim on Sunday or any public holiday is not for that reason invalid. In the event of a claim being more than 100 miles from a recorder's office, and situated where other claims are being located, the locators, not less than five in number, are authorized to meet and appoint one of their number an emergency recorder, who shall act in that capacity until a mining recorder is appointed. The emergency

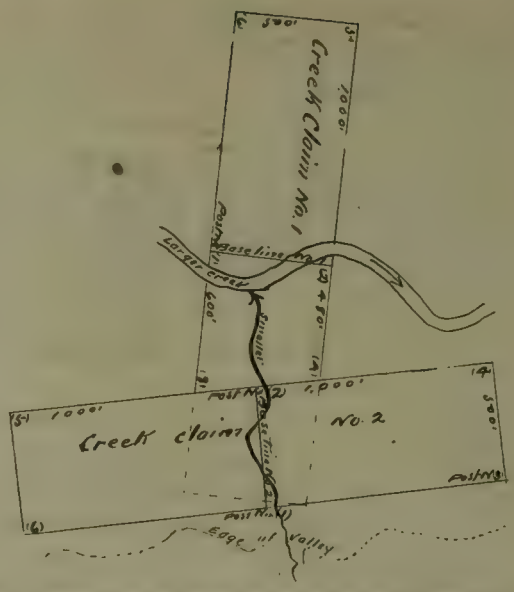

FIG. 3. RIGHT ANGLED CREEK CLAIM GIVING NO. 2 ONE-HALF THE PAY-STREAK OF NO. 1. IN THIS CASE A SMALL CREEK RUNS INTO A LARGER ONE AT RIGHT ANGLES TO THE PAY-STREAK OF THE LARGER CREEK, WHICH HAS A WIDE VALLEY ON THE SIDE UPON WHICH THE SMALLER CREEK ENTERS. A MINER STAKES OUT A CLAIM ALONG THE SMALLER CREEK IN THE VALLEY OF THE LARGER ONE SO THAT HIS CLAIM OF 1000 FT. ON EACH SIDE OF HIS BASE LINE (OF THE SMALLER CREEK) WILL INCLUDE POSSIBLY UP TO 2000 FT. OF THE PAY-STREAK OF THE LARGER CREEK.

recorder must, at the earliest possible date after his appointment, notify the nearest mining recorder thereof, and upon the arrival of the mining recorder, he shall deliver to him his records and the fees received for recording claims.

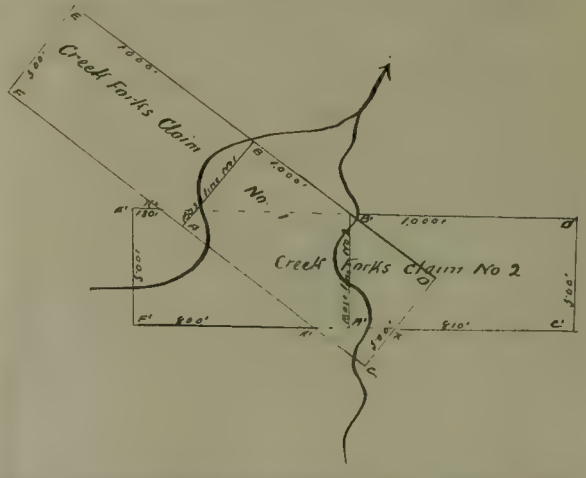

FIG. 4. CREEK FORKS CLAIM GIVING NO. 1 TWO LENGTHS OF PAY-STREAK. A BASE LINE IS RUN UP EACH FORK. A MINER STAKES A CLAIM ON ONE FORK A SHORT DISTANCE UP FROM THE FORK, AND HIS CLAIM BEING 1000 FT. ON EACH SIDE OF THE BASE LINE MAY EXTEND ACROSS THE OTHER FORK, AS SHOWN IN THE FIGURE, THUS GIVING HIM, THE OWNER OF CLAIM NO. 1, TWO LENGTHS OF PAY-STREAK, EACH ALMOST THE LENGTH OF A CLAIM.

Surveys of claims made under instructions issued by direction of the commissioner to a duly qualified Dominion land surveyor are accepted as defining absolutely the boundaries of the claims surveyed, provided the returns of the survey are approved by the commissioner or an official appointed by him for that purpose, and notice of such survey has been published in the Yukon official gazette for 12 consecutive issues, and remained unprotested during that period.

The owner of a claim so surveyed must, prior to the first appearance of the advertisement in the Yukon official gazette, cause to be posted in a conspicuous spot on the claim a notice of his intention to advertise the survey of the claim, and also a plan of the survey of the claim prepared by the surveyor. If, within the time during which such notice is published, the survey is protested, the protest shall be heard and decided upon by the gold commissioner, and if a decision is rendered varying the boundaries of the claim from those defined by the advertised survey, the owner of the claim may have the claim re-surveyed and fresh returns prepared embodying the changes involved by such decision, and such re-survey being approved by the commissioner, or the official appointed by him for that purpose, may without advertisement be accepted by the gold commissioner in lieu of the survey that has been protested. The expenses in connection with the survey and advertisement of claims must be defrayed by the owners of the claims, but no fees are charged by the government for filing plans, etc.

Title.—Any person having duly located a claim may obtain a grant thereof for one or five years by paying to the mining recorder, in advance, the fees prescribed.

Water rights.—Every person owning a claim is entitled to the seepage water on his claim and to the use of so much of the water naturally flowing through or past his claim and not already lawfully appropriated, as, in the opinion of the mining inspector, is necessary for the due working thereof; and is entitled to drain his own claim free of charge.

Stamp-Mill Data at the Brunswick Consolidated

This Company's plant is at Grass Valley, California, and the report for 1914 gives the following:

Stamps working	20
Ore crushed, tons	16,237
Duty per stamp-day (7010 hours lost)	2.326
Quicksilver fed to batteries, ounces	14,756
Value of bullion recovered per ounce of quicksilver fed.	$18.212
Amalgam recovered, ounces	40,267
Bullion in amalgam, ounces	15,663
Gold in bullion, ounces	12,992
Silver in bullion, ounces	2,622
Average value of bullion per ounce	$16.908
Bullion yield per ton of ore	16.628
Concentrate saved, tons	288
Loss in tailing, per ton	$0.88
Extraction by amalgamation and concentration, per cent	93.9
Cost of milling and concentrate treatment, per ton	$0.926

Spelter Production of the Butte & Superior Mine

The report of the Butte & Superior Copper Co. for the last quarter of 1914 contains the following interesting data:

Details of operation	Fourth quarter	Third quarter
Mine development, feet	2,242	5,309
Ore milled, dry tons	33,520	100,600
Average zinc content, per cent	19.4538	18.582
Average silver content, ounces per ton	8.9286	8.6359
Zinc concentrate produced, pounds	20,464,000	60,974,368
Average zinc in concentrate, per cent	53.947	54.32
Total zinc in concentrate, pounds	11,039,557	33,121,312
Average silver in zinc concentrate, ounces per ton	23.54	24.15
Mill recovery, per cent total zinc recovered in concentrate	84.65	89.14
Mining cost per ton	$3.288	$3.201
Milling cost per ton	2.466	2.049
Total cost per ton, mining and milling	5.754	5.250

The reduced output was due to a shut-down for 61 days for repairs to the main shaft, mill overhaul, and general surface improvements.

The financial results were as follows:

	Fourth quarter.	Third quarter.
Net value of zinc concentrate at mill	$238,803	$738,803
Net value of lead concentrate at mill	75,966	282,033
Total value of products	$314,769	$1,020,836
Net profit with miscellaneous income	130,537	499,136

Mining Costs at the Portland Mine

The following figures refer to the cost of mining at this well known Cripple Creek property during 1914, and are from the report of the manager, Frank L. Smale:

Stoping:		Cost per ton crude.
Breaking ore:		
Labor	$0.361	
Explosives	0.177	
Machine-drills	0.119	
		$0.657
Tramming		0.189
Timbering:		
Labor	$0.214	
Timber	0.128	
		0.342
Hoisting		0.161
Sorting and loading		0.160
Pumping		....
Lighting		0.020
Assaying and sampling		0.033
Surveying		0.015
Repairs and replacements		0.200
General expense		0.109
Office expense		0.019
Total stoping, 278,993 crude tons at average cost of		$1.905
Development work only,* 55,820 crude tons at average cost of		2.352
Total, 334,813 crude tons at average cost of		$1.980

*Drifts, cross-cuts, rises, winzes, and shaft-sinking.

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

Amalgamation in Hardinge Mills

The Editor:

Sir—Having given the subject no inconsiderable attention, and being therefore deeply interested in the discussion in the *Press* with reference to amalgamation in Hardinge mills, which covers the general ground of violent grinding of gold ores in bulk in presence of mercury, some of my experiences along these lines may be worth while.

I have never been one to believe that cyanidation would ever become a universal cure-all for gold extraction, and I am indeed glad that amalgamation is again seeking a hearing. My own experiences with amalgamation have led me to favor it. Some notes on pan and barrel work follow.

At the Curaren mill, in Honduras, where the ore was a clear yellow bulky quartz, with clay in the seams, containing about 2.75% iron pyrite, assaying $7 gold and 34 oz. silver per ton, stamps were used to crush to 30 mesh. The 5-ft. pans, 3 ft. 8 in. deep, were charged with about 1½ tons of ore and about 80% water (by volume). This filled the pan to within 8 or 10 inches of the top, the pulp becoming about the consistence of soft mortar. The charge was ground for one hour, then 10 lb. of salt, 10 lb. of sulphate of iron, and 2 flasks (150 lb.) of mercury were added. The grinding was continued for 2 hours more, when the mullers, which were run at 125 r.p.m., were raised one inch. In 3 hours more, or 6 hours in all, the pan was discharged into the settling tank, which contained 200 or 300 lb. of extra mercury, and was half filled with water. Additional water was added to the settler, while in operation, until quite full.

The settler was 10 ft. in diameter, 3 ft. deep, provided with arms turning 25 times per minute to agitate the pulp in order that the amalgam and mercury might be released from the pulp and properly settle into the extra mercury at the bottom. After one hour the tailing was gradually discharged, beginning from the top outlet, the water continuing to flow until the operation was finished. The extraction at this plant averaged 92% gold and 78% silver. It will be observed that this ore, except the pyrite content, was free in character. No concentration was employed here.

At the Rosario mill in Honduras, at which plant also I was at one time superintendent, the ores were rather more complex, consisting of white ribbon quartz with considerable black slate. I observed no indication of talc or graphite in either the slate or quartz that would tend to 'sicken' the mercury. But these ores contained 3.5% of iron pyrite and about 1.5% zinc-blende. The ore contained $9 gold and 28 to 30 oz. silver per ton. The extraction was 86% gold and 67% silver. The pan practice at this mill was in every respect similar to the Curaren plant, except that 15 lb. of sulphate and 250 lb. of mercury were used in each charge. The general clean-up of these plants occurred once each month, when a careful inventory of losses and expenditures was taken. The mercury loss at the Curaren mill was about 7 to 8% per month, while at the Rosario not more than 10% per month. Had these ores contained no silver, such large quantities of mercury would not have been necessary, nor would the losses have been so large in proportion. At the Rosario mill the tailing from the settlers was concentrated on Frue vanners, the concentrate roasted, then reground and amalgamated in pans, without chemicals, and with excellent results.

My first experience in violent grinding of gold ore in bulk in presence of mercury was a number of years ago at Hacienda La Providencia, Puebla, Mexico. In this mill were 16 wooden cylinders, 6 by 8 ft., mounted to revolve about thirty times per minute on their longitudinal axes. They were known as barrel amalgamators. These barrels were in 4 rows of 4 each, each row having its separate clean-up sluice-way, which was 6 ft. wide at the top and 5 ft. 8 in. wide at the bottom, and 1 ft. deep, having a grade of 1 to 20, the bottom of the sluice being about 2 ft. below the rim of the lowest barrel in the row. For a space of 10 ft. below the barrels the sluice was smooth, having an iron bar a few feet below the barrels reaching across from side to side, to hold the balls from going down the run on cleaning up. These sluices were made of masonry, finished smooth with cement on the surface. Cast iron cups, 2½ inches in diameter, were placed in rows 6 in. between centres, each cup having a space equal to its own diameter in the rows and arranged so that the space in the first row would be covered by a cup in the second, and so on. These cups were 1¼ in. deep, with rounded bottoms, all firmly imbedded evenly to the rims smoothly in the cement, this portion of the sluice being 30 ft. long.

The ores of this mill were clear ribbon or stratified quartz, with fine streaks of black slate in the seams containing about 2% iron pyrite, with traces or insignificant quantities of galena, the whole assaying about $12 gold and 20 to 25 oz. silver per ton. Large pieces of ore, too big for the mortars, were broken by hand, there being no crusher on the property. The ore was

then milled with wooden stamps having cast iron shoes and dies, square, to cover every part of the mortar bottom. As the milled ore became small enough, from ¼ in. to 'fines,' it was thrown aside for the barrel charges. That portion thrown out of the mortars considered too large for further treatment was returned by the battery man, who fed by hand. There were no screens to these batteries, and the ore was crushed dry. About two tons of ore was charged to each barrel through a hole in the side, about eight inches square, made for the purpose, tightly closed and bolted when ready for use.

The barrels were lined with steel strips 2 in. wide and ½ in. thick, screwed to the sides lengthwise, about 2 in. space between the strips. A heavy oak timber, about one foot square, ran through the centre of the barrel to act as a shaft, rounded at the bearings, and the whole driven by water power.

When the ore was charged, about 200 lb. of iron balls, 3 in. diameter each, about 2 flasks (140 lb.) of mercury, 15 lb. salt, and 75% water (by volume) were added. The whole mass occupied something less than two-thirds of the barrel. It was then turned for 6 hours at 30 r.p.m., when it was stopped, opened, enough water added completely to fill, then closed, and turned again for about 20 minutes to soften the charge, when the whole mass was slowly dumped into the sluice beneath. There was a constant flow of water over this sluice, about ¼ in. deep, which, when a charge was dumped, quickly swept the tailing away, leaving the mercury and amalgam safely in the cups of the sluice. After the clear water had carried away the sand from all the cups, which the peculiar action of the currents soon accomplished, the cups were cleaned out with small iron spoons made to fit snugly the rounded bottoms of the cups, which operation was performed readily by two men in about one hour. The extraction of gold was never below 90%, and frequently as high as 95%, and silver 64 to 67 per cent.

I operated this property for four years, and saw no reason to change the very efficient work performed by this primitive mill. Labor was cheap, and fairly reliable. The property had been operated for over a hundred years, and the operators, from father to son, were expert in this work. There was no flouring of mercury, nor was there any undue loss of this material, more than should be expected in the best modern mills.

I have related these experiences because the principle involved is similar to the work sought to be performed successfully by the more modern tube-mill, except that the practice under consideration should be a continuous operation. Therefore, the conclusions I have reached, from years of experience and a more recent special study of the subject, cover four important factors in the problem, each to be seriously taken into consideration before any success may be expected: (1) the proper consistence of the pulp; (2) the proper quantity of mercury to use; (3) the subsequent mercury bath: (4) the proper capacity of the machine.

1. The pulp should be thick enough to hold the fine globules of mercury in thorough suspension as it revolves throughout the tube. About 75% (by volume) of water would, in most cases, result in the best consistence, although that must be determined by conditions and the character of the ore. When too thin, the pulp cannot be well amalgamated, and the mercury is likely to be whipped into a sickened condition. The consistence of soft mortar is therefore the best, and the safest. While grinding, the pulp should not be flooded for any purpose.

2. The quantity of mercury to be used should be determined entirely by the content of the ore and consistence of the pulp. According to the facility with which the gold is amalgamated, the quantity of mercury should be regulated. If the ores contain zinc, lead, arsenic, antimony, talc, or graphite, or any other substance tending to affect the activity of the mercury, more mercury should be added to lessen such bad effects, in proportion to the detrimental material contained in the ores. In such cases it may become necessary to use as much as can possibly be carried, in fine globules, by the stiff pulp, in proper suspension without running together to form larger bodies in the mill. But with free ores, or comparatively so, half the quantity would suffice.

3. The subsequent mercury bath is all important to the success of this operation. The lesson may be taken from the performance of the settler, in pan work, for collecting the amalgam and preventing the loss of mercury. This bath should be ample in capacity, and permanent, changed when showing signs of requiring quickening; and the proper dilution of the pulp as it enters the bath.

4. The quantity of ore treated, within economical reason, should depend upon the quality of the work. The capacity of the machine is a matter of judgment, to be based upon results obtained. Amalgamation is a delicate and an important operation in itself. To do good work one should not try to make a tonnage record for grinding and expect to get the best extraction at the same time. When I hear of a 22 in. by 8-ft. Hardinge mill endeavoring to grind and properly amalgamate 175 tons of ore per day, when the makers of that mill announce 144 tons as the extreme capacity limit for that size *for grinding alone,* and presumably under the most favorable conditions, I feel that something must be radically wrong and am not surprised at unsatisfactory results. On the other hand, I am surprised to hear of having to stop a Hardinge mill every day to clean it out. It would be very interesting to know how and why it is done, and how long it takes to do it.

In conclusion, it is more than evident that violent grinding of gold ores in presence of mercury, in itself, does not necessarily result in flouring and loss of mercury. In my opinion, the tube-mill and barrel amalgamator are not any more violent than the grinding pan with mullers running at 125 r.p.m. I have had wide experience with both systems, and I am yet to be convinced.

J. W. PINDER.

San Francisco, California, February 3.

CONCENTRATES

Readers of the MINING PRESS *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

MINERS on contract in the Mt. Morgan mine, Queensland, last year earned the following wages: stoping, $3.98; development, $5.86; and shovelers, $3.46 per shift of eight hours.

WATER USED by 11 mines at Kalgoorlie in October 1914 totaled 1,237,097 gal. per day, in the treatment of 5235 tons of ore per day, equal to 236 gal. per ton of ore treated. This water was used for every purpose in power plants and the mills.

COLLOID is a term capable of only a negative definition. The characteristics of a colloid are not those of a crystalloid. In solution it diffuses through membranes with difficulty and possesses low osmotic pressure. The matter in colloidal solution is unaffected by the action of gravity until coagulated by an electrolyte.

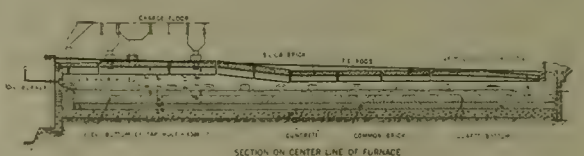
AVERAGE PRICE for rough trimmed mica is about 35c. per pound. For extra large sizes, as high as $1 per pound can be obtained. For mica which is only fit for grinding, the price is about $15 per ton. At the present, San Francisco trade in the mineral, which has been chiefly an export one, is stopped owing to the unsettled conditions in Europe.

ALASKA SLUICES were introduced last year for the first time in the history of the Lena Goldfields property, Siberia, and recovered from 96 to 98% of the gold, compared with 88 to 93% by the trommel machines and other Siberian methods employed. It has been decided to supplant all washing machines and Siberian sluices, *kulibinas*, by Alaska type sluices as fast as possible.

GOLD is found only in the native state, and not as a chloride, which is one of the forms of silver found in ores. The usual method for the preparation of gold chloride is to dissolve gold in aqua regia (1 part nitric and 3 parts hydrochloric acid), and evaporate the liquid to dryness, keeping the temperature as low as possible. A brownish red mass is formed, consisting of $AuCl_3$, mixed with more or less of the protochloride and hydrochloric acid. On adding water the protochloride is decomposed into gold and trichloride, but the acid can be eliminated only by shaking with ether, which withdraws the trichloride from its solution in water.

UNDER THE LAWS OF COLORADO (Mills' Annotated Statutes, 1912, sections 4875-4876), "any person who has or hereafter may have a tunnel or cross-cut, the mouth of which is located on his own ground or on ground in his lawful occupation, shall have the right to drive and continue the same through and across any located or patented claim in front of the mouth of such tunnel, but not to follow or drive upon any vein belonging to the owner of such claim. Such tunnel or cross-cut may be driven and worked for the purpose of drainage and for the purpose of reaching and working the mining ground of the tunnel owner beyond the intersected claim." It is also provided that the owner of the intersected claim shall at all times have the right to survey the tunnel and a right to compensation for ore taken from beneath his claim or for injury done to his ground. In view of this section, a tunnel-site location, the line of which crosses a patented claim, would appear to be a valid location, except, of course, no rights could be acquired thereunder in a patented ground or any lodes found therein.

VITAL POINTS IN REVERBERATORY SMELTING as practised at Steptoe, Nevada, are as follows, according to R. E. H. Pomeroy in the *Transactions* of the A. I. M. E. Factors affecting efficient combustion of the fuel: (1) The use of a burner to give a proper atomization of the oil so as to obtain a long uniform flame without overheating any portion of the furnace; and (2) regulation of the draft so as to furnish the proper mixture of gases for



NO. 2 REVERBERATORY FURNACE AT M'GILL, NEVADA.

complete combustion in the furnace. Factors affecting the operation of the furnace proper: (1) Careful preparation of the charge by adequate mixing of all ingredients before charging; (2) addition of enough lime rock, preferably coarse, to produce an active boiling in the furnace; (3) maintaining a deep bath of molten matte to equalize and distribute the heat over the whole of the hearth; (4) frequent skimming so as to carry only a thin layer of slag over the matte bath; and (5) operating the furnace for the best smelting conditions ignoring the waste-heat boilers as factors in the power supply. Factors affecting the life of the furnace: (1) The furnace roof set high over the hottest portion of the hearth; (2) frequent fettling to protect the side walls, and (3) frequent charging and active charge mixtures to avoid floater and blanket formation requiring excessive firing.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

NEW YORK

Business Feeling in New York. The Copper Situation: German Consumption, Porphyry Costs, and Export Trade.—Inspiration, Arizona Commercial, North Butte.

In view of the complications arising from war zone measures, it is not at all surprising that a reactionary tone should have prevailed throughout the week. New York has been such a centre of the activity arising from the abnormal conditions abroad that, for a time, it has been inclined to forget about the conflagration that is raging, until some phase such as that of the present moment brings it back to sharpened realization. There has been no little consolation derived from the fact that although a ticklish situation promised to develop, there has been no free selling of securities, simply a dullness that distressed brokers more than security owners.

The copper situation is apparently righting itself faster than might be expected. Present consumption is undoubtedly largely based on ordnance requirements, but in any event demands have warranted the resumption of work at capacity in the Lake region, where the Calumet & Hecla and its subsidiaries are again on full time. None of the resulting increased output will be marketable for delivery earlier than April or May, but it indicates a better feeling and improved conditions. Just what American copper producers are to do with the metal which Germany has been buying for years is a problem, though a study of the finished products turned out by German manufacturers ought in the present juncture to be interesting to every factory owner in this country. Our copper producers can look for an increased home market if American ingenuity in smaller manufactures reaches out to take the business on which the German consumption of copper was mostly based.

It has undoubtedly been in the mind of nearly everyone not following the situation very closely that the porphyry mines must suffer greatly in the way of copper costs while running on a curtailed output. To such it will be something of a surprise to note that, notwithstanding demoralized conditions prevailing during the last quarter of 1914, the principal low-grade coppers made records for the year in turning out reduced tonnage at low cost. Inasmuch as costs go up with reduced tonnage and fall as output increases, the figures are all the more surprising. Utah's costs for the quarter were 6.68c.; Nevada, 8.42c.; Ray, 8.64c.; and Chino, 7.71c. per pound. On these figures, Chino alone showed a material increase; Ray Consolidated was within one-tenth of a cent of its record for the June quarter of 8.54c.; while Utah and Nevada made their best showing for the year. These properties and the other low-grade producers that must depend on large tonnage and stable market conditions for profit are the factors mostly interested in the export trade as a balance-wheel for the market. For some time authorities have been inclined to view copper as being in the hands of the producers marketwise. And while this is undoubtedly true, it has resulted often in giving a regrettable advantage to the foreign buyer. One of the principal topics of discussion at the recent National Foreign Trade Council at St. Louis was the question of the legality of agreements between competitors covering export trade. John D. Ryan, with copper in mind beyond a doubt, spoke at some length of the disadvantages wrought by the Sherman law in this regard. Since that time, however, there has been a *pronunciamento* from Washington slanting decidedly in favor of combinations between exporters made to avoid cut-throat competition. Not content altogether with mere expressions of opinion, the copper interests represented by Phelps, Dodge & Co., the American Smelting & Refining Co., and the Amalgamated, have joined hands with the United States Steel Corporation in asking for definite legislation that will permit of common selling agencies on export business. It is difficult to exaggerate the importance of this movement, just at this time when the matter of export trade is so much to the fore. As to copper specifically, it means that it will be impossible hereafter for foreign buyers continually to get the cheapest metal in this market as they have done all too frequently in past years. In every movement that has brought order out of chaos in the copper world, Mr. Ryan has been a power. He tranquilized Butte, and eliminated Heinze; when production outstripped consumption some four years ago, it was he who got the representatives together in London and saved the situation; now, it may be taken for granted, if further measures are taken to conserve one of our greatest natural resources, the results will be largely due to Mr. Ryan.

Inspiration's convertible bonds have never been sold up to the prices achieved by some of the issues put out by other similar copper companies, most of which issues have since been all converted. The market features in Inspiration have moved Eugene Meyer, Jr. & Co. to start something of a campaign on the bonds.——Arizona Commercial, after many financial ups and downs, is at last said to be earning a net profit of some $10,000 per month.——North Butte, which was one of the spectacular successes of Mr. Ryan's earlier career, is evidently back as a high-grade copper mine. The Edith May vein on the 2800-ft. level is showing the richest ore which the mine has had since its first bonanza days under the Cole-Ryan management.

WASHINGTON, D. C.

Bill to Allow Development of Certain Land in Utah.—Chances of Other Mining Legislation.

The bill dealing with the location, entry, and patenting of lands within the former Uncompahgre Indian Reservation in Utah, containing gilsonite and other similar minerals, has been reported on favorably by Senator Smoot to the public lands committee of the Senate. The amendments made are immaterial. The bill relates to lands not so far disposed of and reserved for future action by Congress. It has been found that on these lands are extensive and valuable veins of gilsonite. No elaterite, ozocerite, or sand asphaltum worth while has been found there. Residents of Utah have urged the opening of the area under the general mining laws, contending that this would open to location and entry by the general public of considerable areas of land containing the mineral and promote a healthy competition with the owners of the deposits, the title of which has passed from the United States. That is the report of the Department of the Interior which has favored the bill opening the lands under the general public land laws. But Secretary Franklin K. Lane says that in view of the fact that it is the intention of the bill to open the gilsonite lands under the general mining laws, wording should be added to the bill making it entirely clear that the lands in question, if entirely mineral, shall be opened only to location and disposition under the mining laws, and if non-mineral, under the non-mineral land laws of the United States; and so the committee has amended the bill to read, "Entry under all land laws of the United States according

to the character of the lands or of the mineral deposits therein."

Now that the ship-purchase bill is temporarily shelved, there is hope for some of the minor mining legislation such as that involving the experimental and rescue stations and the codification commission bill. There is going to be a great rush to grind bills out in the last 10 days of the session, and these bills ought to go through as well as the gilsonite bill mentioned above. The leasing bill is absolutely dead, seemingly.

HOUGHTON, MICHIGAN

INCOME TAX LAW.—MANGANESE DEPOSITS.—SHARES IN 1868 AND 1915.—COPPER IN THE NONESUCH FORMATION.

The report comes from Boston that John R. Stanton, of the Baltic Mining Co., has filed an application in the federal court for an order to exempt the mining companies from complying with the provisions of the income tax law. Mr. Stanton points out that some distinction should be made between mining companies and other corporations not owning mines, in computing the depreciation in the value of the property on which an income tax is to be paid.

Several reports have been made recently that the old Clark mine at Copper Harbor would be opened for manganese in the near future. According to F. W. Nichols, the resident agent for the property, there is no truth in these reports. It might be suggested to these people who are making so much of the present shortage of manganese in this country that they consider opening some of the old mines in the Michigan iron district. It is well known that some of these iron mines closed down because of the large amount of manganese mixed with the iron ore.

A memorandum of the business of the Boston Stock Exchange of March 24, 1868, was found in the files of a late resident of Hancock. The following comparison of the figures of that day with those of today are very interesting:

Mines.	Offered.	Asked.	Today.
Allouez	$ 3.50	.....	$ 42.75
Calumet	22.00	$30.00	395.00
Franklin	15.00	15.50	5.00
Hancock	5.40	.....	11.75
Quincy	27.00	29.00	56.50
Superior	1.00	1.50	28.25

Great interest was aroused during the last year by the reported richness of the Nonesuch formation at the White Pine mine at the extreme southern end of the district in Ontonagon county. Early in November exploration work was started on the Smith property about 10 miles west of the White Pine, on what was believed to be the Nonesuch formation. The exploration work is being done on Sec. 7, T. 50, R. 42 and on Sec. 12, T. 50, R. 43. Considerable test pitting has been done and a shaft has been sunk 70 ft. A 40-ft. cross-cut has been driven through the formation, and 15 ft. of drifts to date. F. B. Close, who is in charge of the exploration work, is in Houghton securing a diamond-drill outfit, and drilling will be begun as soon as possible. Mr. Close states that the 'rock' in the cross-cut will average about 12 lb. of copper per ton.

GRANTS PASS, OREGON

PLACER MINING ACTIVITIES.—LOGAN AND DEEP GRAVEL PROPERTIES.—GRANITE HILL QUARTZ.—A NEW GOLD PRODUCER.—LIMESTONE.

Though there have been several cold snaps to freeze ditches and check the water supply, taken as a whole this has been a favorable season for the hydraulic placers of Josephine county. There has been considerable rain, and there is plenty of snow on the higher ranges, assuring a full head for the giants till early summer. Many thousand dollars of gold is exchanged at the local banks every week, and heavy shipments are being made direct by miners to the mint at San Francisco.

TAILING DREDGE UNDER CONSTRUCTION.

BOW GANTRY C. & H. DREDGE.

Gold worth $6000 to $10,000 has been taken from the sluices of the Logan mine, of the Waldo district, with every monthly clean-up. The manager, John Logan, says that the mine will enjoy a long run this season, as there is an abundance of water and plenty of rich ground. Though one of the oldest placers in southern Oregon, the vast acreage of old channel on the Logan gives it a great supply of working ground. The gravel washes down easily, and contains gold from the surface to bedrock. A hydraulic elevator, to assist in disposing of the tailing, is one of the mechanical features of this property.—— In this same district the Deep Gravel mine is operated by H. L. Herzinger, day and night. The Deep Gravel did not get started promptly last fall, as much new machinery was added to the equipment, and this was late in coming.

The manager for the Oregon Gold Mines Co., James O'Grady, which Company revived the old Granite Hill mine of Grouse creek, a few months ago, is highly pleased with results. Several good clean-ups have been made, as a result of the operation of 10 stamps of the mill. This was on ore crushed from a new vein opened near the surface, and above water-level. The shoot contains free gold principally, and is from 10 to 18 ft. wide. A similar vein has been opened on the Ida, one of the Granite Hill claims. With the careful and economical management now being given it, the Granite Hill seems certain to prove a profitable venture. Though the lower levels are yet flooded, the water will be removed as the development and mining of the upper levels proceeds. A cyanide plant will probably be erected to treat base ores, of which there is a good tonnage.

The Jim Blaine is a new quartz mine lately added to Josephine county's list of gold producers. This property is

on Grave creek, and is really a part of the holdings of the Columbia Mines Co. the latter being a placer company. The quartz property has been leased from the Columbia company by George Epperly, Charles Hansen and Bergmen Bros. These men have erected a stamp mill, and will have direct charge of the property. The mill is now crushing ore.

The crushing of Josephine limestone, for use as a fertilizer is now to be done on a commercial scale. As there are mountains of this in western and southern Josephine county, the industry promises to become one of considerable extent. The first plant is being installed by C. W. Courtney on Marble mountain, near Wilderville, and but a short distance from the western terminal of the Grants Pass & Western railroad, to which line the product will be hauled for shipment. Another plant will be built beyond Hays hill, on Deer creek, where there is an immense deposit.

FAIRBANKS, ALASKA

QUARTZ MINING.—PROBLEM OF HANDLING LOW-GRADE GRAVEL.—MACHINE-DRILLS AND REDUCTION OF LABOR.—WORK ON THE CREEKS.—TOLOVANA.

That the quartz outlook for the district is much brighter at present than for a year past is evident to anyone who takes note of the recent development. The gradual decrease in placer mining has induced more men to investigate the quartz prospects till cheaper power and transportation allows of the large bodies of low-grade gravel still available in the district.

Operators in the Fairbanks district owning deep low-grade ground are doing much figuring at present on the question of lowering costs. Undoubtedly the railroad will result in cheaper power, but it is toward better mining methods that much experimenting will be done. For instance, along the Chatanika river are large areas of low-grade ground that while frozen, the gravel and sediment is also very tight and hard. Much difficulty is experienced in driving points, a big crew of pointmen being necessary. Plans are at present under way to fashion a steam point that can be fitted into the chuck of a machine of the 'jackhamer' type. While the present type of point is not strong enough to stand the heavy-hitting machine, it is also suggested that the machine be used to drill the hole, a 'sweater' being then inserted to do the thawing. In that case, however, the escape of steam from the hole would be hard to prevent. It would seem that a heavier point combining both properties of driving and drilling would have to be devised to meet with the best success. At one plant, a 'jackhamer' has been used with the idea of inserting 'sweaters.' The machine was run by steam, and while it finished the hole in bedrock that was fairly hard, in other ground the steam escaping through the hollow steel caused the hole to cave and render the steel almost impossible to pull. The successful solving of this problem is of great interest to the district.

That the introduction of power drills will be a big factor in the future development is evident from the marked success attending the installation of machines at the property of Crites & Feldman on Fairbanks creek. Aside from the Newsboy mine, Crites & Feldman are the only operators so far to listen to the preaching of engineers about the vast efficiency of machines. Five men are now needed to keep the 5-stamp mill busy one shift per day. Before, 15 men could not keep the mill supplied for the same period. At present, one machine strips all the ore two shovelers can handle, while the machine-man sharpens his own steel. The carman runs 100 ft. of drift per month on development work, besides doing the tramming. The millman completes the crew. The machines used are the Ingersoll-Rand stopers and 'jackhamer,' and while the exact figures are not made public, it is understood that a substantial profit is made every month, as the ore is of excellent grade. So far all development has been toward driving the main adit.

Huddleston Bros. are working on a fine looking prospect at the head of Too Much Gold creek, a tributary to Fairbanks creek. The ground is owned by O'Neill and Landecker. Visitors qualified to know say that as far as opened the vein shows good ore and promises fair returns for the lessees. Down the same creek, Lou Goyette is extracting some ore from the White Horse claim. Several tons is awaiting the completion of the customs mill, which is now being built.

Still farther up Fairbanks creek, Bert Stevens is working on his property opposite 13 Above. A test run has shown profitable ore. August Hess is investigating a rich stringer near the Mizpah claim that shows good ore. So far only surface work has been done.——Opposite this claim, Charles Heilig is now building a small custom mill to serve the numerous prospects on the creek. A Huntington mill, with apron plates, purchased from the Tolovana mine, will be the amalgamating unit. The gyratory crusher from the Rainbow mine, capable of producing a feed suitable for a Huntington, will complete the crushing equipment. Large bins have been provided, and with a good water supply this mill will be in a position to help greatly the prospectors on this creek. The mill should be operating in February.——At the head of Fairbanks creek, Foss & Farveen have done a great deal of development in the last three months. Several hundred feet of adits has been driven and 75 tons of ore has been milled at the Chatham Mining Co.'s mill. The ore averaged $25 per ton. No more will be milled till the Heilig custom mill is in operation.

If the option on the Chatham Mining Co.'s claims is not taken up by the holder, E. L. Scrafford, it is probable that this property will soon be reopened. While the ore already won yielded a good profit with hand labor, the rock now in sight is lower grade. It is the intention of the management to install machines.——Joe Henderson is working a lease on the Homestake property. The vein is narrow, but of high grade. The operations up to date have been profitable to the lessee.——Production continues steadily at the Rhoads-Hall mine. The 5-stamp mill is kept in continuous operation, and the ore still yields a good profit. About 25 men are employed.——Miners are examining the Tolovana mine with the object of leasing it, but no decision has been arrived at yet. ——At the Spalding mine, a lease has been taken by Drury, Lundblad, Irvine & Spalding. Both the Soo and Wild Rose claims are under lease. Most of the work so far has been directed toward opening the Wild Rose, and a good orebody will soon be ready for stoping. As $80,000 was taken out of a small block of ground on the same lead a short distance away, the lessees expect to make a good showing when it is opened. A 3-stamp mill is on the property. These claims are at the head of Dome creek.

The stampede to the Tolovana country is not as spirited at present as a few weeks ago. Many men have gone into the new diggings, but most of them have returned to wait for favorable reports. Many holes have been sunk on the tributaries of Livengood creek, on which the original discovery was made. So far, however, by late reports, no holes have been 'bedrocked' on Livengood creek, although some are down over 80 ft. at present. There is still a chance for 'pay' on the main creek, although the tributaries so far show nothing in many holes. The men doing the most work are the most optimistic of the future. Even if no 'pay' channels rich enough to drift out are found, it is thought by many that the creek will make a good dredging property. Some gold is found all the way down from grass roots, but whether it amounts to enough per yard for a dredge is as yet problematical. Twingood creek is about 60 miles from Olnes, a station on the Tanana Valley railway. A fairly good trail has been made, and dog-teams have made the trip in 24 hours.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

A great number of shippers of bullion have an idea that some of the United States assay offices are closed, and therefore not receiving bullion. This is not so. The lower branch of Congress, after three years of ineffectual legislation to abolish the assay offices at Salt Lake City, Utah, Carson City, Boise, Helena, and Deadwood, have this year ceased their fight on the institutions and provided an appropriation for their maintenance. They are receiving bullion as usual and giving it prompt attention.

ALASKA

'The Petroleum Fields of Alaska' is the title of a short paper by Alfred H. Brooks presented to the February meeting of the A. I. M. E. in New York. Petroleum seepages are known in Alaska at four localities, all on the Pacific seaboard. These, named from east to west, are Yakataga, Katalla on Controller bay, Iniskin bay on Cook inlet, and Cold bay on the Alaska peninsula. Besides these, a petroleum residue has been found near Smith bay on the north Arctic coast of the territory. At Katalla, Cold bay, and Iniskin bay there has been some drilling for oil, and in the first field several productive wells have been opened. Alaskan petroleum, so far as its composition is known, is a refining oil, with a paraffin base and low sulphur content. The Katalla field is a region of closely folded and faulted Tertiary rocks, possibly comparable in its structure to that of the California fields. Much of the drilling in this field was done without any regard to geologic structures, and but few good logs are available. The presence of oil is indicated by the success achieved, but it will require further drilling to determine the presence or absence of a large pool. At Yakataga the structure of the oil-bearing formation appears to be much simpler, and it ought to be possible to test the field without a large amount of drilling. In both the Iniskin and Cold Bay fields, Middle Jurassic sandstone forms the country rock in the oil-bearing area. The open folding should be favorable to oil pools; on the other hand, some faulting has been observed. There is reason to believe that the oil-bearing formation found in these two fields may have a wider distribution in the Alaska peninsula. Whether it carries petroleum at other localities has not been determined. On the whole, there is good hope of finding petroleum in the Alaska peninsula. Alaska affords a steadily growing market for petroleum and petroleum products. In 1913, 15,682,000 gal. of crude oil, 1,735,000 gal. of naphtha, 661,000 gal. of illuminating, and 150,000 gal. of lubricating oil were shipped to Alaska. If any oilfield were developed on the Alaska peninsula, it would be specially well situated for supplying the local markets on Seward Peninsula, Yukon river, and Pacific seaboard. As early as 1865 the Russians knew of the existence of oil in Alaska.

Bethel

(Special Correspondence.)—It is rumored that there has been a rich discovery on Kwisluk river, and that it will create a boom this spring. Some gold is taken out every summer in this area. Cost of living is high, $14 for 100 lb. of flour, $15 for 100 lb. of sugar, $1 per meal at the roadhouse, and everything in proportion, foodstuffs rising in price this fall as soon as navigation closed. A mining man from Iditarod, discussing recently the high cost of provisions, which are at least 35% more here than at Iditarod, pointed out that there is no reason for this, as the mines in the present state of development do not justify such high charges, and the freight rate is about one-fourth higher to Bethel than to Iditarod, so it is, as I formerly stated, that this country is better for capitalists than for a poor man.

A review of the mining situation in this district is as follows: the gravel is from 1 to 50 ft. deep, and may be more in places; mining is done where gravel is from 1 to 4 ft. deep, and this is what I would term poor men's diggings, as it can be handled with the old methods of shoveling into boxes and by hand rockers; the deeper gravel has not yet been prospected; some attempts have been made to sink shafts, but they never get to bedrock on account of water, in some only at a few feet; to carry on a systematic prospecting in this ground requires capital, as it is almost impossible without drills, and that is too advanced for the ordinary prospector.

Bethel, December 14, 1914.

Juneau

The Alaska Mexican, Alaska Treadwell, and Alaska United companies will pay No. 77, 111, and 30 dividends, of 20c., $1, and 30c. per share, respectively, on February 27.

Tolovana

Various rumors about this district have been circulated, but there is nothing new to report, except that Marsh and Wheeler are down 90 ft. without having found bedrock. H. Marsh is optimistic about the area.

ARIZONA

Cochise County

Ore shipments have been resumed from the Letson lease of the Higgins property at Bisbee. The ore will be taken from a dump which has been made during the period of development since August last.

Greenlee County

A 20-ft. flywheel on an air-compressor at the Arizona Copper Co.'s smelter flew to pieces last week, killing the engineer on shift, who was at the throttle. The engine was also badly damaged.

Yavapai County

Ore from 1200 ft. in the United Verde Extension mine is now being sent to the United Verde smelter at Jerome. A wide lode has been opened in this property.——It is stated that a transportation and drainage tunnel is proposed for the Bradshaw mountain district. It would be about 6000 ft. long, and would cut several veins at 1400 ft. vertical depth.

CONCENTRATOR AND SMELTER AT NEEDLES, NEAR BORDER OF ARIZONA AND CALIFORNIA.

CALIFORNIA

Amador County

New machinery for the Original Amador mill is being installed, and it is hoped that the 20 stamps and Hardinge mills will crush 300 tons per day, instead of 90 tons as at present. T. S. O'Brien is in charge.——The Bunker Hill company distributed 2½c. per share last week, being dividend No. 103. High-grade ore was recently opened at 2400 feet.

Calaveras County

Advices from Angels Camp state that the mining outlook in this county is encouraging, and numerous properties are under investigation.

The Caliwash Mining Co., of Seattle, with a capital of 50,000 $1 shares, is preparing to start work in Chile gulch at Mokelumne Hill. John Johnston is president and general manager.

Kern County

Sulphide ore has been opened for some distance below 400 ft. in the Sunshine mine at Randsburg. The main shaft is down 525 ft., and this is the first property in the district to open this ore, which is of high grade.——The Phoenix mine and mill have been overhauled, and a much better saving is being made.——Other properties busy in this district are the Consolidated, Old Glory No. 2, King Solomon, numerous lessees, and the Red Dog mill.

Mariposa County

(Special Correspondence.)—The new hydro-electric plant of the Mountain King Mining Co. was started on February 13. It is situated on the Merced river. The dam, of the gravity overflow type, is 90 ft. long, 11 ft. high, and 10 ft. wide at the base, made of reinforced concrete. The power house is of concrete also, containing one 350-kva., 3-phase, 4000-volt generator, direct coupled to a scroll-case turbine running at 600 r.p.m., made by S. Morgan Smith Co. The transmission line is 1½ miles long. Three transformers reduce the voltage from 4000 to 440 and 220. A new modern, 30-stamp, 200-ton mill, driven by motors, is being erected, and may start on June 1. A 600-cu. ft. Sullivan cross-compound compressor has been installed. It is driven by a 100-hp. motor. An electric locomotive will haul ore and other cars. An electric incline tramway has been built for haulage between the Yosemite Valley railway and the mine tunnel. The whole equipment was designed by Rudolph W. Van Norden and constructed by John R. Cahill, of San Francisco.

Mountain King, February 16.

Nevada County

During the installation of new machinery at the Empire mine, the miners were laid off for several days, but have now returned to work. The large electric hoist is in position, and improvements made to the shaft.—— A miner named Damiano is suing the Birchville Mining Co. for $25,000 for damages caused by an accident.——A renewal of the bond on the Idaho-Maryland mine is being arranged between G. W. Nellis, the lessee, and S. P. Dorsey and sons. The property is fully equipped.

Development of the major gravel claims on Cement hill is giving good results.——A rotary crushing machine with 100 tons capacity per day is to be installed on the Meister mine of the Columbia Consolidated company, near Washington. E. C. Klinker is in charge.

Placer County

(Special Correspondence.)—Since the last rains, mining has become brisk on Forest Hill divide. Five leases are being operated on the property of the Mayflower company; W. E. White has cut a large body of auriferous gravel on his Belford lease; Wallace, McKenzie, and Rhodes & Son, leasing in Gavins cañon on the Canothus ground, are all in 'pay' gravel, and are doing well; work is progressing rapidly at the Excelsior mine, the long adit being about finished and a rise being driven into the old channel; the old Dardanells is producing as usual; some good gravel is being extracted from the Baltimore right along; the White Oak Co. is still driving an adit in rock hard black slate, the ground is getting very wet, and it expects to break good gravel any day; the owners deserve it as they have worked eight years without any returns from their claim; the Buckeye people are finishing a rise to a new ground and expect to work the mine for many years more; and there are several large quartz prospects. We look for a lively summer.

Forest Hill, February 12.

Plumas County

Eight miles from Greenville the Mountain Meadows Mining Co. is prospecting 3000 acres of ground, which is partly in this and partly in Lassen county, and the erection of a dredge is proonble.

Shasta County

The Bully Hill Copper Co. has increased its working force at the experimental plant, where the zinc-copper ores are being treated.

The fume suit was continued in San Francisco on February 23, after nine weeks' recess, Judge Van Fleet presiding over the court.——A new mill is nearly finished by the Victor Power & Mining Co. at Harrison gulch. This type of machine is the first of five units of 40-ton capacity each per day. This Company's Gold Hill, Midas, and Victor mines produced over $20,000 in the past three months, and the cyanide plant is extracting $9000 per month from old tailing.

Siskiyou County

On Greenhorn creek the El Oro Dredging Co., of Oroville, controls 110 acres of ground, and has a dredge at work, which has handled 18 acres since August 17, 1914. The average depth is about 18 ft. The Company is testing ground between this area and Yreka, near the state highway.——The Ash Creek mine and mill is to start in March. Enough shares in the Company were sold in Yreka to allow of this being done.

Tuolumne County

(Special Correspondence.)—Tuolumne county will have a splendid exhibit of gold specimens and ores at the Panama-Pacific Exposition. The collection comprises samples from scores of mines, and its actual gold value will amount to many thousands of dollars.

Work at the Draper mine, situated near Soulsbyville, is revealing orebodies equal to the best ever opened, according to the best information obtainable. The mine is the property of Andrew McCormick, of Stockton, and was visited this week by the owner.——A retaining dam is being constructed at the Black Oak to impound the tailing from the mill, which in the past has been going to Curtis creek.——It is expected that extraction of auriferous gravel from the property of the Springfield Tunnel & Development Co. will begin within a few weeks. The drainage tunnel is in 2400 ft., the face now being past the first of a series of channels which will be opened by rises. A good gold yield is assured when gravel can be taken out, the extensive development of the property having conclusively proved this. Water has been the retarding agency, but the drainage tunnel will, it is believed, forever dispose of this problem.——It is reported that work has been resumed at the Garfield mine, east of Tuolumne.

Sonora, February 13.

COLORADO

Clear Creek County

The Georgetown Sampling Works is working overtime to cope with ore shipments.——The Homestake adit has cut one of the lodes which it was driven to develop, and it is 30 ft. wide.——Numerous small mines in the district are being actively worked.

Lake County (Leadville)

The Lake County Metal Miners' Association met at Lead-

ville on February 13, when state and local mining conditions were discussed.——A hydraulic rock quarrying machine has been devised by S. C. Monberg of Leadville, who is a mining blacksmith. It has a new feature in the self-sharpening points. ——The Big Five company has arranged for a long lease with the Ibex company for 25 blocks of ground between the Yak tunnel and the Big Four shaft. A 1000-ft. adit will be necessary to open this ground.——Old tailing from the old Adams mill, worth about $60,000, is to be shipped by T. Horrigan and partners to the Leadville district mill, where a flotation process will treat the material.

TELLER COUNTY (CRIPPLE CREEK)

Representatives of all industries from Denver, Colorado Springs, and Pueblo inspected the Cripple Creek district on February 26 and 27.——*The Daily Mining and Financial Record* is preparing a 'Greater Cripple Creek' edition for distribution.——M. B. Burke and eastern people have acquired the H. A. McIntyre interests on Gold, Raven, and Globe hills, and Battle mountain for $100,000.

The output of Stratton's Independence in December was as follows: mine ore, 4260 tons averaging $6.60 per ton; dump and low-grade mine ore treated, 9400 tons; net profit, $6700.

IDAHO

The report of the state inspector of mines for 1913 covered 225 pages, with many illustrations, but that for 1914 is only 55 pages with one picture. This is due to the lack of ample appropriation for the publication. The output of metals was as follows: lead, 345,334,206 lb.; zinc, 49,239,000 lb.; silver, 13,621,123 oz.; copper, 5,178,000 lb.; gold, 62,238 oz.; and total value, $24,976,706. Over 90% of these came from Shoshone County mines. There were about 5200 men employed, and there were 27 fatal, 79 serious, and 312 minor accidents. Development of mines and metallurgical improvements are briefly discussed, also the state's natural resources. Six pages are devoted to statistical matter.

SHOSHONE COUNTY (COEUR D'ALENE)

'Friendliness v. Friction at the Bunker Hill & Sullivan,' was the title of an article in the *Press* of January 9, by John A. Goodell. In it the Kellogg Industrial Y. M. C. A. was discussed. The secretary, J. E. Sturdevant, has published a report of the year's work, which resulted in all bills being paid and a small surplus. There were 25,635 baths taken by members, 11,420 letters written, 12,219 books lent, 860 attended the educational classes, and 4450 the gymnasium and athletics.

The Monitor mine is to be extensively developed, under the personal supervision of Otis Hill, of Spokane, director and one of the heaviest stockholders in the Montana-Idaho Copper Co., organized several months ago to take over the Monitor and adjacent properties. When the forest fires of 1900 swept through the Coeur d'Alene they left the site of the Monitor mine a heap of ruins. The 700-ft. shaft was filled with charred timbers and ruined machinery, and, though an extensive body of high-grade copper ore had been uncovered, the damage done by the fire stopped all further improvement. An adit is now being driven 1000 ft. below the 700-ft. level of the old Monitor shaft. Machine-drills and other plant have been installed and substantial buildings erected. The portal of the adit is situated 1000 ft. above the tracks of the Milwaukee line, permitting cars to be loaded direct from the adit by a gravity system. In the course of the adit several orebodies are known to exist, which the management expects to reach within a few hundred feet.

Spokane stockholders in the Caledonia Mining Co., operating at Kellogg, have received notice that the directors recently adopted a resolution authorizing the declaration of monthly dividends of 2c. per share each for March, April, and May, of $52,100 for each 30-day period, a total of $156,300. To date Caledonia has paid $322,539 in dividends, all but $52,000 of which has been distributed since the Company was reorganized, following the settlement of the litigation with the Bunker Hill & Sullivan company, including $104,200 paid in January and February of this year. When the declarations for the next three months are paid, the total disbursements will aggregate $478,829, or approximately 18.5% of the issued capitalization of $2,605,000.

It is reported that the National Copper Co. is to resume operations at its mine and mill near Mullan.——The new Callow flotation plant at the Hunter mill is working, and a total recovery of 90% is expected from all departments. The ore is peculiar, as it contains silver and lead in a gangue of heavy spar. The flotation concentrate assays up to 500 oz. silver and 40% lead.——The Coeur d'Alene Antimony Mining Co. has been formed by Wallace, Wardner, and Kellogg people to work the antimony mine at the mouth of Pine creek, which has been closed since 1889.

NATIONAL COPPER CO.'S PROPERTY, NEAR MULLAN, IDAHO.

MICHIGAN

HOUGHTON COUNTY (THE COPPER COUNTRY)

Finnish employees of the Calumet & Hecla, Osceola, Wolverine, Mohawk, Ahmeek, Allouez, Centennial, and other mining companies of the northern part of Houghton county, held a meeting last week for the purpose of considering plans to expel from the district the socialistic agitators who are again working among them in the guise of union labor organizers.

MISSOURI

JASPER COUNTY

In the annual mining and industrial issue of *The Joplin News Herald* are given some interesting figures on the Missouri-Kansas-Oklahoma zinc-lead district. The output during the past two years was as follows:

Ore.	1913. Pounds.	1914. Pounds.
Blende	541,107,593	490,148,273
Calamine	40,346,251	32,562,300
Lead	94,962,640	87,364,481
Total value	$14,356,461	$11,922,837

The Joplin and other Missouri districts contributed $9,283,653 to the yield of 1914. From 1830 to 1914, inclusive, the total production of all fields in this region was $267,452,915. The twenty districts contain many individual producers, probably 1000, which makes the total output a large one. On account of the number of small mines, one of great size stands

out boldly. There are several of these, but the greatest is probably the Oronogo Circle, on a lease of 126 acres of the Granby Mining & Smelting Co.'s land 10 miles northeast of Joplin. Its output is over $12,000,000, and the present workings at 225 ft. are underlaid by new deposits from 240 to

MAP OF THE JOPLIN AND OTHER MISSOURI ZINC ORE DISTRICTS WHERE MINING IS VERY ACTIVE.

290 ft. There is operating one central plant of 1000 tons daily capacity, supplied from three, and later on, four shafts. A gasoline locomotive hauls the ore cars between these points. Electric motors in the plant use 1200 hp. A model of the property is on view in the Palace of Mines and Metallurgy at the Panama-Pacific Exposition.

MONTANA

Fergus County

During 1914 the Barnes-King Development Co. produced 51,471 tons of ore, yielding $424,272, or $8.242 per ton. Costs totaled $4.403 and profits $3.839 per ton. The total net profit was $150,419. The manager, George T. McGee, states that the North Moccasin in Fergus, and Piegan-Gloster in Lewis and Clark county, show promising developments. Reserves in the latter property are about 30,000 tons of $8.35 ore. The new mill is 75% completed, and will probably start on May 1. Dividends may be expected later on in the year. From March 1, 1911, to the end of 1914, the Company's revenue was $1,115,330, including cash and bonds worth $262,420. The expenditure was $950,882.

Silverbow County

The city of Butte has granted a 10-year franchise for a right-of-way through its streets for the transport of ore to the Davis-Daly company on the consideration of one cent per ton hauled. The last quarterly report of this Company shows that the Colorado shaft was down to 2500 ft. on December 15, and cross-cutting is now being done. Good ore has been opened on this and the 1750-ft. level. For better ventilation this shaft is to be connected with the Moonlight shaft of the Anaconda. Owing to copper in the mine-water the iron pipe has been replaced by wood-lined iron pipes. The recent assessment has brought in $250,000.——It is fairly definitely known that the Anaconda company will reopen the old Alice mine, the first work being to retimber the main shaft, which is 1600 ft. deep.

NEVADA

Mineral County

At a vertical depth of 1200 ft., and 6000 ft. in the adit, the Hubbard ore-shoot has been cut by the Lucky Boy company. This orebody was opened previously by a shaft, and yielded rich ore. The adit is 6 by 8 ft. in the clear, with a 2 by 3-ft. drain, and has unwatered the Hubbard vein and other properties in the district.

Nye County

(Special Correspondence.) In its new Scorpion shaft, so called on account of the number and size of scorpions found in sinking, the Eureka Johnnie company has cut rich gold specimen ore at 22 ft. Most of the vein was covered with wash but has been opened for 60 ft., showing free gold. It is from one to three feet wide, and improves with depth, in a sedimentary formation.

Johnnie, February 20.

Six mines at Tonopah produced 10,081 tons of ore worth $207,418 during the past week.——In January the Belmont treated 16,100 tons, yielding 309,142 oz. bullion, with a profit of $115,159. A dividend of 12½c. per share will be paid on April 1, half of the usual distribution.——The Tonopah company treated 12,600 tons, shipped 231,825 oz. bullion, and made a profit of $56,875.——Profits of the Jim Butler were $18,033. ——At 400 ft. the Extension is stoping 14 ft. of ore.

Storey County

At 2500 ft. in the north end of the Comstock lode the Consolidated Virginia company is driving on a well defined quartz vein, assaying $1 to $4 per ton. Indications are favorable. ——The Ophir is shipping ore to the Kinkead mill.——The Mexican is extracting ore from 2300 ft., and sinking below this level.——At 2650 ft. the Union Con. is driving north and south on a quartz stringer.——The Pumping Association is busy at 2500 ft., preparing for pumping at 2700 ft. ——The Yellow Jacket, in the Gold Hill area, is opening a good quartz orebody at 1200 ft.——The Caledonia is prospecting at 1000 feet.

OREGON

In *The Mineral Resources of Oregon* for December, published monthly by the state Bureau of Mines and Geology, the 'Ore Deposits of Northeastern Oregon,' is the title of a paper by Arthur M. Swartley. It covers 229 pages and is accompanied by illustrations and maps. Field work was done in 1913, and up to September 10, 1914. G. E. Goodspeed, Jr., aided in this work. The area includes Baker, much of Grant, the

BEN HARRISON MILL, BAKER COUNTY, OREGON.

southern portion of Union and Wallowa, and the north part of Malheur counties. The ranges are called the Blue mountains. The dominant geologic feature of the mining region is the granitic mass termed by the author the 'Blue Mountain Batholith,' which means a giant intrusion of a granitic rock extending to unknown depths. The ore deposits are the product of this intrusion into older rocks. The gold output in 1913 was $1,525,182, from 55 placer and 20 quartz mines. The book gives considerable detail of the Cornucopia district, with the Union-Companion, Cornucopia, Last Chance, and other properties; the Wallowa district; Bald Mountain-Elkhorn region; and the Greenhorn area with the various mines therein. A total of 97 halftones and maps adds greatly to the value of

the report. All Oregon mining men should secure a copy of this work.

The mining outlook for the Sumpter district seems to be bright. It is reported that the Ben Harrison mine has been sold to the American Smelting & Refining Co. Under the management of W. C. Fellows the property has been well developed.——The Imperial mine is again producing ore for the mill and shipments. It has been leased by C. L. Arzeno.——The Golden Gate 10-stamp mill is finished. It was erected by B. L. McLain of Sumpter.——It is probable that more dredges will be constructed in the region.

UTAH

Beaver County

The Fortuna Royal Gold Mining & Milling Co. has been organized at Beaver, with a capital of $200,000, to develop the Royal and Annie La Rue claims in the Fortuna district, mentioned in the *Press* several months ago.

Juab County

For the purpose of draining about 50 of the mines and properties of the Tintic district, the Tintic Tunnel Co. is now being organized, according to *The Salt Lake Tribune*. The promoters propose to drive a tunnel from near the head of Goshen valley, at an elevation of about 5000 ft., due west, which shall intersect the Tintic district north of Treasure hill and which will gain a depth of about 1500 ft. below the collar of the Bullock and Laclede shafts. The bore will crosscut practically all of the north-south fissures in the Tintic district at nearly right angles, and will gain a depth of from 1000 to 3000 ft. below the collars of the shafts of the various properties. It is estimated that the cost of the tunnel, which will be about five miles long, will approximate $1,000,000. The Company will own and control the greater portion of the East Tintic, Diamond, and Silver country, and the property-owners of that section, who so far have been approached on the project, have signified a willingness to do all in their power to make the enterprise a success. No one has shown a disposition to block or hinder the project. The directorate, consisting of some of the most prominent and active men in Utah mining circles, will be completed during the next few days and it is proposed to start the work within the next 30 days. The capitalization of the Company has not been decided on, but tentative plans are being considered for the issuing of $1,000,000 in bonds. Engineers are now engaged in making surveys and getting out detailed data, which will be completed about March 1. It is proposed to use electric power in the tunnel, which is to be double-tracked for transportation purposes. A concrete ditch will be built either beneath the tracks or to one side, which is to have a capacity of 75 sec.ft. of water per minute. For a number of years it has been the desire of mining men to drain the Tintic district. Water has been one of the greatest handicaps to a number of the deeper mines, and the cost of pumping from the deeper levels in which heavy tonnages of ore have been encountered has prevented the mining of the ore. The proposed tunnel would not only make the mining of the ore profitable, but would afford a means of transportation and the necessary water for milling purposes.

Salt Lake County

The fourth quarterly report of the Utah-Apex Mining Co. states that there is little of importance to note. Prospecting has revealed ore in the upper workings, and a large area remains to be opened. Separation of the zinc content is proving difficult. The low price of lead has affected the revenue, which was $200,728 for the term. The net profit was $69,914.

Summit County

Work has been resumed at the Snake Creek tunnel at Park City. To relieve the pressure of water from the heading, it is proposed to drive around to the left of the present face, and so divert the flow, when the tunnel will be continued. The present flow is 7500 gal. per minute. G. W. Lambourne is general manager, and J. Matheson in charge for the J. A. McIlwee Contracting Co. The total length is to be 14,000 ft., of which over 10,000 ft. has been driven.

WASHINGTON

Stevens County

The Last Chance mine of Northport has been acquired by the Norman Lead Mines Co., of Spokane. A 1500-ft. adit is to be driven to cut the vein at 770 ft. on its dip. The mine has been developed for over 10 years, and has shipped lead-silver-zinc ore worth about $410,000. Sidney Norman is manager.

CANADA

The Mines Branch of the Department of Mines, Ottawa, has published 'Economic Minerals and Mining Industries of Canada' as a Panama-Pacific edition, as the Dominion has a large display of ores and metals at the Exposition at San Francisco. The book consists of 78 pages, profusely illustrated, with an excellent map of the country. All minerals are discussed in brief, yet in an interesting manner.

Alberta

Dingman No. 2 well of the Calgary Petroleum Products Co. is yielding 54°B. oil from 2772 ft., which is about 150 ft. above the oil-sand cut by the original well. Drilling in the two wells was at the rate of 10.83 and 5.73 ft. per day, respectively.

Coal mine accidents in this province in 1914 were as follows: fatal, 209; serious, 44; and slight, 50; a total of 303.

British Columbia

The preliminary review and estimate of mineral production of British Columbia in 1914 is published in *Bulletin* No. 1 of the provincial Bureau of Mines, as compiled by Wm. Fleet Robertson, the mineralogist. The output was as follows:

	1913.		1914.*	
	Quantity.	Value.	Quantity.	Value.
Gold, placer	.....	$ 510,000	.....	$ 524,000
Gold, lode, oz	272,254	5,627,490	246,936	5,104,126
Total gold		$ 6,137,490		$ 5,628,126
Silver, oz	3,465,856	1,968,606	3,394,752	1,768,666
Lead, lb	55,364,677	1,175,832	52,424,732	1,834,866
Copper, lb	46,460,305	7,094,489	44,968,541	5,845,910
Zinc, lb	6,758,768	324,421	7,029,276	309,288
Total metals		$17,700,838		$15,386,856
Coal, long tons	2,137,483	7,481,190	1,821,308	6,374,578
Coke, long tons	286,045	1,716,270	237,931	1,427,586
Building materials, etc.	.....	3,398,100	.....	3,000,000
Total value production		$30,296,398		$26,189,020

*Estimated.

As with other countries, the war affected the metal output somewhat, and prices considerably. The following dividends were paid by metal mining companies: Consolidated, $464,376; Granby, $449,955; Hedley, $300,000; and Standard, $475,000, a total of $1,689,331, compared with $2,390,131 in 1913.

Work has been resumed at the Consolidated Mining & Smelting Co.'s No. 1 mine, near Ainsworth, which has been closed since August 3.——The Silver Hoard company adjoining has also started.

Ontario

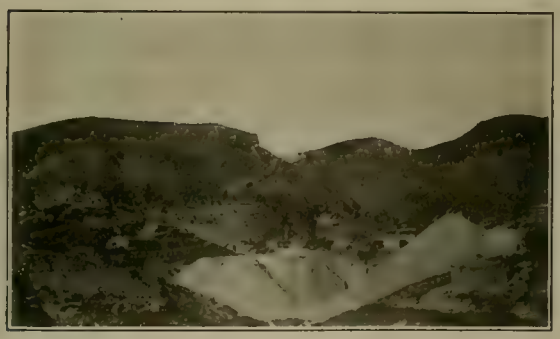
During January the Alexo nickel mine produced 808 tons of ore.——The Crean Hill and No. 2 mines of the Canadian Copper Co. are to be reopened, and all the blast-furnaces at the smelter blown in.

The total shipments of ore from Cobalt since 1904 to the end of 1914 amount to 198,155 tons.

MEXICO

The main mineral zone of the Santa Eulalia district is the subject of a 44-page paper presented to the February meeting of the A. I. M. E. at New York, by Basil Prescott. The district lies 12 miles southeast of the city of Chihuahua. Official records of the state place the discovery of the ore in 1707 and the production is between $300,000,000 and $500,000,000. Toward the end of the eighteenth century there were 6000 people in Santa Eulalia, 63 *haciendas*, 168 reduction and cupelling furnaces, while the city of Chihuahua had 70,000 people and 20 smelting plants. Americans entered the district in about the eighties (1880).

The ore deposits occur in a Cretaceous limestone of unknown thickness, overlain by a series of rhyolitic tuffs and flows. The limestone is gently folded and is cut by several systems of fissures, of which only those with a general north-south strike are pre-mineral, and control the deposition. The deposits are of two main types, the earlier silver-bearing iron sulphide types occur as high-grade tabular bodies resembling veins and as large masses of relatively low-grade ore. The gangue of this type is composed of lime-iron silicates that point toward a close association with an igneous rock mass which has not yet been encountered. In the later silver-lead-zinc type the ore occurs in vertical chimneys and horizontal *mantas*, principally as oxides, though at a depth of 1500 ft. some sulphides have been developed. During oxidation the ore chambers have increased in size owing to the solution of the walls by the sulphuric acid generated in the process, and a substitution has taken place of nearly one-half part by weight of the original constituents of the ore, by newly introduced elements and radicals. Both types are believed to have come from greater depths than those yet reached by mining, and their ultimate source, from a consideration of similar deposits, is believed to be an igneous rock in contact with the limestone at some horizon below. The deposits are thought to have been formed at unusually great depths, as indicated by the proved great vertical range of the silicate minerals



PART OF SANTA EULALIA DISTRICT, SHOWING SANTO DOMINGO, SAN TOY, BUENA TIERRA, AND POTOSI MINES.

coupled with the absence of the igneous rock, and by the practically unchanged character of the silver-lead-zinc ores as far as developed. The volcanic capping is believed to be distinctly later than the economically important ore deposition.

It is reported at Douglas, Arizona, that the rains of last December destroyed the town of La Dura, flooded La Colorado mine, and destroyed the new mill. The property had been closed for some time on account of the revolution.—— The Lucky Tiger Combination company paid a dividend of 9c. per share on February 13, equal to $64,380. Work is going on as usual at the mine, but food and supplies are short in the district. The manager, L. R. Budrow, was at Douglas last week.——General Juan G. Cabral entered Cananea with about 3000 men on February 17. The army is well trained and equipped.

PERSONAL

W. J. Loring is in California.

H. W. Turner is back from London.

Morton Webber sailed on the *Baltic*, on January 27, for London.

T. T. Read is attending the mining convention at Spokane this week.

O. L. Kittenbach will sail for Manila, February 27, on the *Manchuria*.

Howard W. DuBois was in San Francisco recently returning from Alaska.

Frederick C. Gilbert, of Durango, has been spending a month in California.

D. C. Jackling has been tendered a place on the directorate of the Missouri Pacific railroad.

Malcolm Maclaren was in San Francisco on his way to Korea to examine the Suan mine.

Fred G. Farish has gone to Mexico to manage the Lluvia de Oro G. M. Co.'s mines in Chihuahua.

David McClure has returned to San Francisco from South America and London and is living at the University Club.

H. N. Stronck delivered a lecture on 'Management Engineering' at the University of California on February 16.

P. Thill, formerly master mechanic at the Great Falls plant of the Anaconda Copper Mining Co., has been appointed assistant chief engineer in charge of all engineering work done at Great Falls.

Arthur Crowfoot, who was employed at the Boston & Montana reduction works for nineteen years, has been appointed superintendent of the concentrator of the Arizona Copper Co. at Morenci, Arizona.

Joseph W. Boyle, president and general manager of the Canadian-Klondyke company, left Dawson on January 28 and will go as far as New York. He will visit Ottawa and Montreal before returning.

L. V. Bender, formerly assistant general superintendent at the Washoe Reduction Works, was appointed general superintendent, and H. S. Ware, formerly blast-furnace superintendent, was appointed to assistant general superintendent.

J. H. Klepinger, W. T. Burns, and P. Thill, of the B. & M. reduction department of the Anaconda Copper Mining Co., are in the East visiting various copper refineries for the purpose of collecting information for use in the design of the refinery that is to be built at Great Falls.

Obituary

A. H. Merritt died February 12 after being sick about three weeks, during which time his condition was not thought serious. Mr. Merritt was associated with the development of the West Coast Manufacturing & Supply Co. for the past thirty years, and its directing officer at the time of his death. He leaves many friends among employees and the business men with whom his work brought him into contact.

Schools and Societies

The Southern California section of the A. I. M. E. met at Los Angeles on February 24. A paper, 'Hydrometallurgy of Copper,' was read by W. L. Austin, of Riverside.

The Northwestern Mining Convention, to be held at Spokane, February 22 to 27, will have an ore-testing department arranged to determine the value of rocks and ores submitted from any part of the Northwest.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, February 24.

Antimony	20 —20¾
Electrolytic copper	15½ 15¾
Pig lead	4.10— 5 05
Quicksilver (flask)	$62.50
Spelter	9 — 9¼
Tin	38 39½
Zinc-dust, 100-kg. zinc-lined cases	12

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, February 24.—Electrolytic copper is quiet at 14.37 to 14.50 , lead strong at 3.85c., and spelter is strong at 8 to 9c , spot metal is scarce and futures are pressed for sale. Sales of April, May, and June spelter are reported at 10.50c., or about 2c. over prime western metal.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending

Exports of silver to the Orient from London up to February 11 totaled £881,500 (9,000,000 oz.), against £578,500 (6,000,000 oz.) in the same period of 1914. It is possible that the German blockade of England will result in silver being kept in the United States, rather than risk its loss on vessels sunk; while neutral countries may increase their needs in advance. London advice states that prices are remarkable for the smallness of fluctuations. Early in February there was a brisk demand for the metal in India, due to low prices, increased duty, and the marriage season.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending

Export figures are again to be published by the customs department each week and not held for 30 days, a regulation in force for some time past. During the third week of February the exports totaled 7,142,042 lb., of which 5,077,497 lb went to England. Complete statistics of the exports in 1914 are now available, this being 840,080,922 lb., about 80,000,000 lb. under that of 1913.——The United Verde, Arizona, production in 1914 was 32,449,116 lb., about 3,000,000 lb. less than in 1913.——London prices of copper are £64 15s. to £65. 2s. 6d. per ton. Stocks in England totaled 38,283,840 pounds.

LEAD

Our metal telegram from New York was mutilated, and gave quotations for the week of 8 to 9c. for spelter, but prices are now between 9 and 10c.——The Joplin market is excited, and in the third week of February 60% zinc ore sold for $75 per ton, choice lots realizing $78, while $80 is expected next week. In the corresponding week of 1914 blende sold for only $40 to $43.50 per ton.——London quotations are £40 2s.6d. per ton, or 8.6c. per pound.

MANGANESE

On account of the German blockade of England and the probable cessation of manganese shipments to the United States, the price of manganese ore has jumped from $68 at Baltimore to $100 per ton at Pittsburgh. Steel companies of the latter place are said to be sufferers, as they have been relying upon the stock on hand and contracts with dealers for their supply this year

COMPANY REPORTS

JIM BUTLER TONOPAH MINING COMPANY

The report of this Nevada Company covers the year ended September 30, 1914. The Belmont plant at Millers treated for the Company 34,722 tons of ore worth $744,799, yielding $247,800 net profit. In 1913 the results were 19,181 tons, $385,957, and $104,682 respectively. The low price of silver affected the revenue considerably. The treasurer's statement shows cash and loans on collateral valued at $235,781. There is silver stored worth $85,297.

The general superintendent, Frederick Bradshaw, states that work in the Wandering Boy area produced 20,533 tons of ore, and development totaled 7761 ft. The Desert Queen mine produced 14,189 tons of ore, and development amounted to 3612 ft. Ore reserves in the property consist of 34,642 tons of positive, 13,723 tons of possible, and 1832 tons of probable ore, a total of 50,197 tons.

SHATTUCK-ARIZONA COPPER COMPANY

This Company operates in Cochise county, Arizona, and the report is for the year 1914. During August, September, and up to October 23, the output was reduced to 50% capacity, on account of the metal market, and then the mine was closed. Good developments resulted at 200, 400, 700, and 850 ft., in the copper area; between 100 and 300 ft. the gold-silver ore continued to open well; and work in the lead area was stopped. The present rate of development is 700 ft. per month, the mine being in good condition.

A total of 84,801 dry tons of copper ore, and 52 tons of lead ore were smelted, yielding 10,846,918 lb. copper, 14,065 lb. lead, 198,419 oz. silver, and 2445 oz. gold. The net cost of refined copper produced was 8.72c. per pound. The total revenue was $1,660,573; net profit, $587,497; and dividends, $525,000. Cash and metal on hand is valued at $1,045,315.

BRUNSWICK CONSOLIDATED GOLD MINING COMPANY

This Company operates at Grass Valley, California, and is one of the few companies in the state making any report public, it setting a good example. The report under review covers the year ended January 28, 1915, and the remarks of the president, W. H. Oscanyan; vice-president and general manager, R. Chester Turner; superintendent, C. H. Mallen; and secretary, J. Stadtfeld, include the following points of interest: Development totaled 2702 ft., including 240 ft. of sinking in the new shaft. This footage is 600 more than in 1913. The shaft cut quartz veins at 90, 151, and 190 ft. below the floor of the 1250-ft level. The Brunswick ore-shoot continues to furnish the mill with a good grade of material. Where it flattens, the gold content is higher. The heavy flow of water at 1100 ft. in the new shaft has diminished considerably, and the pump at 1250 ft. can cope with the water by working 13 out of 24 hours. Stoping on Company account was confined to No. 4 shoot above the 1250-ft. incline level. Some small bonanzas were found. The failure of No. 5 rise to develop the ore expected leaves little above 1250 ft. Reserves total about 16,000 tons of good ore and 5000 tons of low-grade material. It is proposed to erect a head-frame over the new vertical shaft, a new mill or addition to the present one, a cyanide plant for concentrate, and an assay office.

The 20-stamp mill crushed 16,237 tons of ore, 1795 tons of which was on tributers' account. Bullion recovered from amalgamation and concentration was $288,392. Mill details will be given in another issue of the *Press*. Including balances from 1913, the year's revenue was $343,869. All charges totaled $165,957, and four dividends of 6c. each per share, amounting to $94,869, were paid, and another on March 15.

MINERAL STATISTICS

America's Mineral Products

The mineral products of the United States are discussed in a small volume now being distributed by the U. S. Geological Survey which contains a fund of information concerning the useful minerals and their values and production in all the states during 1912 and 1913. The figures given in some of the tables are stupendous. In one table are given the figures for mineral production from 1880 to 1913, the metals being valued at $185,000,000 in 1880 and increasing to $883,000,000 in 1913. The non-metallic minerals increased from $173,000,000 in 1880 to $1,562,000,000 in 1913, and the total mineral production from $365,000,000 to $2,446,000,000. This total for 1913 was an increase over 1912 of more than $200,000,000. The value of the metals imported for consumption in 1913 was $237,000,000, and of those exported $319,000,000. The value of the total mineral production from 1880 to 1913, inclusive, was $35,197,000,000. These huge figures are of general interest, but the chief value of the volume lies in the figures and discussion of the increased or decreased production of each state during recent years. Seventy principal minerals are discussed in the pamphlet, entitled 'Mineral Products of the United States in 1912 and 1913,' a copy of which may be obtained free of charge from the Director, U. S. Geological Survey, Washington, D. C.

Radium, Uranium, and Vanadium

The year 1914 was an eventful one in the industry of mining radium, uranium, and vanadium ores showing by far the largest year's production yet made. Figures collected by Frank L. Hess, of the U. S. Geological Survey, indicate that the output amounted to about 4300 short tons of dry ore carrying 87 tons of uranium oxide and 22.4 grams of metallic radium. The ore was valued at about $445,000. The ore produced in 1913 contained 41 tons of uranium oxide and 10.5 grams of radium, and that produced in 1912 contained 26 tons of uranium oxide and 6.7 grams of radium. About 90% of the contained radium is thought to be recoverable under improved processes.

In Utah the Standard Chemical Co. made the first commercial production of carnotite ores from the Henry mountains during the year, and the commercial production of uvanite, a radium-bearing mineral new to science, accompanied by other uranium minerals, one or more of which are yet to be described, was begun at Temple Rock, 45 miles southwest of Green River. Shipments were made from newly opened carnotite deposits at Court House, northwest of Moab, Utah, and from deposits 16 or 18 miles southeast of Moab. A first shipment was also made from Blue Mountain, Routt county, Colorado.

The Paradox valley region was, however, as usual, the chief producing area, and from it came the bulk of the ores. The Standard Chemical Co. was the largest single producer, and shipped more than half of the country's output.

Two companies, the Standard Chemical Co. and the Radium Company of America, produced radium salts during the year, and W. A. Schlesinger started a radium-refining laboratory. The European war stopped nearly all operations in both mines and reduction plants; for the two companies mentioned sold their product largely in Europe and practically all the ore bought by brokers was sold abroad. A little more than 1200 tons of ore, containing 28.1 tons of uranium oxide and 7.2 grams of radium, was consigned to Europe, but as the foreign refineries were closed, a part of it was held in transit.

No vanadinite or similar ores are known to have been sold for vanadium during the year.

New Machines and Devices

Water-Wheels and Accessories at the Exposition

In the Palace of Machinery, at the Panama-Pacific Exposition, one of the most complete installations is that of the Pelton Water Wheel Co. and its co-exhibitors. Water-power development is such an essential factor in the economic life of the Pacific Coast states, that it was felt by the Exposition authorities that a complete working exhibit showing all the phases of hydraulic installations would be of great interest.

The general plan of this exhibit may be divided into three parts: (1) an operating replica of a high-head hydro-electric installation; (2) an operating replica of a low-head turbine installation; and (3) a display of Pelton equipment as designed and built for use in various classes of installations.

It being obviously impractical to secure high-head natural flow, this is provided in the first section of the exhibit, by means of a Pelton-Doble turbine pump, which will be driven by a 150-hp. 6-cylinder submarine type Diesel engine, manufactured by the New London Ship & Engine Co. The pump is of the single-stage type, designed to lift against an effective head of 200 ft. In order to secure this head with a single stage, it is obvious that the speed must be materially higher than 350 r.p.m., the speed of the Diesel engine. In order to secure this speed, a herring-bone speed increasing gear, built by the Falke Gear Co., is interposed between pump and engine, in lieu of standard flexible couplings. The guaranteed efficiency of this type of gear is 98½%. This speed increasing gear is direct connected to the pump, which it drives at a speed of 1800 r.p.m. In the discharge line of the Pelton-Doble high-pressure pump, is installed a Venturi recording meter, thus providing an accurate and continuous measurement of its output. The effective pressure of the pump discharge is measured by means of Crosby indicating gages; these being installed as well, on the suction side of the pump.

The water from the pump is discharged directly into a Pelton-Doble tangential wheel. This wheel represents the largest type of construction in tangential work and is of the overhung type, direct connected to a water-wheel type, 75-kw., 300-r.p.m., direct-current generator, manufactured by the General Electric Co., and part of their co-exhibit. Observation windows are placed in the base of this wheel, so that the action of the jet as it impinges on the buckets can be carefully observed. The regulation is maintained within very close limits, by means of a Pelton-Doble oil-pressure governor, actuating a needle nozzle with auxiliary relief valves, all of the Pelton-Doble type. From the switchboard, the electric power is conveyed to the mains of the Exposition, and is utilized as part of the energy supplied on the grounds.

The second section of the Pelton company's exhibit consists of a Pelton-Doble high-pressure, high-capacity vertical-type deep-well pump, which is driven by means of a 110-hp., 1760-r.p.m., alternating-current, vertical pump motor, built by the Westinghouse Electric & Manufacturing Co., and part of its co-exhibit. The energy for operating this motor is taken from the alternating current high tension mains of the Exposition. The motor is of a design especially worked out to meet the requirements of vertical turbine pumps. Crosby indicating gages and a recording Venturi meter are placed in the discharge line, the latter, as well as the Venturi meter measuring the water input of the tangential water-wheel unit, being a co-exhibit of the Builders Iron Foundry, of Providence, Rhode Island.

After passing the recording Venturi meter, the water under a pressure equivalent to a head of 50 ft. (this being obtained by the single stage runner of the deep-well pump) is discharged into a Pelton-Francis high specific speed turbine.

It is important to mention that an interesting feature of the exhibit is the special equipment provided for maintaining a supply of oil under proper pressure for operating the automatic governor of both the turbine unit and the tangential wheel unit.

Referring to the Pelton-Francis turbine, which is of the horizontal type, this is direct connected to a 30-kw. 1400-r.p.m. direct-current generator, which is also part of the co-exhibit of the Westinghouse company. The energy from this generator is delivered to the service mains of the Exposition.

The third section of the exhibit consists of a number of Pelton products arranged to show general design and construction. The principal item of this exhibit is a 20,000-hp., single-discharge runner, Pelton-Francis turbine, designed and built for direct connection to a 15,000-kva. alternating-current generator. This unit is designed to operate at 360 r.p.m. under an effective head of 500 ft. This turbine will be set up complete, except that the runner will be left out.

There will also be a number of the Pelton ball-bearing hydraulic giants on exhibition. These giants are a great improvement over the old ones used during the period when hydraulic mining in California was in its heyday, and now meet a wide range of use in various classes of construction work.

Commercial Paragraphs

The Hardinge Conical Mill Co. announces that the Calumet & Hecla Mining Co. has completed the installation of 12 large Hardinge mills in its new plant at the White Pine mine.

The Wood Drill Works, Paterson, New Jersey, publishes a leaflet on the 'Brownie' drill. This machine weighs 83 lb. and the tripod 65 lb., a one-man drill. It is designed especially for breaking up boulders for crushers and road work, small tunnels, and sewers, and will drill to 8 ft. The cylinder and chest is of vanadium-tungsten iron. A complete outfit, with set of steels to 7 ft. and dressing tools, is $125 f.o.b. Paterson.

The Harbison-Walker Refractories Co., of Pittsburgh, has just distributed an interesting and well arranged booklet of 113 pages, entitled 'A Study of the Malleable Furnace.' The six chapters, with illustrations, cover the following: characteristics of malleable iron, properties, process of manufacture, furnace construction, operation, micro-structure of malleable cast iron with a number of micro-photos and analyses, and a record of a typical heat. All iron workers should secure a copy of this useful book.

The Colorado Iron Works Co. announces the establishment of a down-town office in Denver for the accommodation of its many customers and friends who may find it inconvenient to visit the main office at the works. Suitable quarters have been obtained in the Ideal building, corner 17th and Champa streets, the most central and accessible part of the business district, where the mining fraternity is invited to call when opportunity offers. The office is in charge of Hugh B. Lowden, secretary of the Company, and Randall P. Akins, sales manager, will make it his headquarters when in the city

MINING PRESS

Volume 110 SAN FRANCISCO, MARCH 6, 1915 Number 10

1915 MARCH—THIRD MONTH 1915

Monetary and commercial matters at the East continue unsettled and seem to show a lack of confidence in the future. As to the duration of the war, there is no general expectation of an early cessation of hostilities.—*Mining and Scientific Press*, March 4, 1865.

ARTICLES

CHROMITE POSSIBILITIES IN CALIFORNIA.
By Samuel H. Dolbear..... 356

Chromic iron ore, which is used in the preparation of refractory materials, ferrochrome and other alloys, and the making of chromium salts, occurs widely distributed throughout the United States. It was first mined in California in 1880, production here at one time reached 2000 or 3000 tons per year, but with changed conditions has decreased to a total of 255 tons in 1913, according to the United States Geological Survey. The larger part of the world's supply has lately been drawn from France and the possessions of Great Britain. The war in Europe has caused domestic consumers again to turn toward California. The deposits of this state and their commercial possibilities are here discussed by one who speaks from authoritative knowledge.

CANADIAN MINERALS AT THE PANAMA-PACIFIC EXPOSITION.. 359

The great variety of mineral products of Canada are set forth in a well chosen and carefully arranged exhibit.

CAVING SYSTEM AT THE OHIO COPPER MINE.
By F. Sommer Schmidt..... 361

By the use of radiating rises from levels 60 ft. apart, Felix Macdonald has brought the mining cost at the Ohio copper mine down to an average of 22c. per ton; probably the lowest figure for underground mining in the United States. The orebody is 450 ft. wide and extends from the 100-ft. level to the adit through which the ore is drawn out, 1200 ft. below, with a dip of 50°. Of the ore, 75% is secured in mining. Hammer drills are used in the rises, 80% of the ore caves, and no shoveling is required. Two men draw a daily output of 2500 tons.

PROFITS OF THE RAND MINES, LTD., SUBSIDIARIES..... 364

January profits, in most cases, show a gratifying increase over the preceding month. The supply of laborers has increased, and a larger output is expected during February.

METALLURGICAL PRACTICE IN THE PORCUPINE DISTRICT.
By Noel Cunningham..... 365

There are six mills in the Porcupine district and two markedly different classes of ore to be handled. The best method of treating each and the difficulties which arise in attempting to treat mixtures of the two in one mine are here discussed by a millman of two and one-half years' experience in the district, who believes that counter-current decantation is the most satisfactory general method, agitation should be continuous, and pressure filters are more suitable than vacuum filters, while the choice of crushing machinery, use of amalgamation, and of concentration depend on the relative amounts of the two ores to be treated.

PRACTICAL POINTS ON SAMPLING.
By Arthur Feust..... 368

Attention to details often spells the difference between success and failure, especially in mine examination work. The general principles of sampling are well established; one of the younger engineers here describes for the benefit of his less experienced colleagues the details of methods which have been tried and found satisfactory.

PROSPECTING RIVER BARS IN COLD COUNTRIES.
By Thomas N. Turner..... 371

With the help of the frost it is possible to sink a shaft through water to the river bed beneath.

THE SAM YET PROSPECTING MILL.
By Algernon Del Mar..... 371

Good results are not always dependent upon refined methods, and the latest equipment, as an ingenious Chinese has demonstrated in Nevada.

INCREASING THE USE OF STEEL SUPPORTS IN MINES.
By Frank H. Wagner..... 372

Steel supports are more permanent than timber, but require more labor to erect, cannot easily be altered to fit, are less resilient than timber, and more attacked by corrosive mine water. A combination of wooden butts and steel sets removes many of these objections.

SAFETY POWDER-BOXES 373

Boxes designed to decrease danger from accident at the Nevada Consolidated open-cut workings have been found to lead to economy in the use of powder.

KALI SITUATION IN 1914. 373

The war has caused a shortage of labor and the decreased output has led to an increase in overhead charges.

DEPARTMENTS

DISCUSSION:

Molybdenum. *By Faris V. Bush*..... 374

The Romero mine, near Las Vegas, New Mexico, is producing a molybdenite concentrate, 70 to 90% pure, which sells readily for $1.50 per pound of pure molybdenite.

Patents and Metallurgists. *By Jay A. Carpenter*.... 374

Users of patented machinery and processes are too apt to forget that the cost of perfecting, popularizing, and selling is properly chargeable in the market price or royalty. Sometimes this leads to a blunting of the sense of morality.

CONCENTRATES 376

MINING IN THE FAR NORTH.

Hot Springs, Gold Mountain, Koyukuk, and Andreafski Districts.
By Emil Edward Hurja..... 377

Output in the Hot Springs district of the Tanana in 1914 exceeded that of any previous year, clean-ups aggregating $1,000,000. There is less activity in the Gold Mountain and Red Mountain districts, but the Andreafski is a new district where the search for gold has met with much success.

STATEMENTS as to impending heavy shipments of phosphate rock from Montana to Japan prove to have been premature. Mitsui & Company state that no such contracts have been made as were announced locally.

AWARD of the gold medal of the Institution of Mining and Metallurgy to Mr. Willet G. Miller is a fitting bestowal of the order of merit of the Institution upon a man who stands head and shoulders above his fellows.

PENDING arrival of Mr. T. A. Rickard, in April, Mr. Thomas T. Read, New York editor of the *Press*, will be in charge of the editorial work. Mr. Read will remain in San Francisco through the period of the Exposition, after which he will resume his duties in New York.

BERLIN will, when normal conditions are restored, quote independent prices on zinc, lead, aluminum, and antimony, if the present plans of the Elders of the Merchants of the City of Berlin are carried out. The Berlin Copper Exchange has made a satisfactory record, and the new move will lead to a corresponding expansion of the Metal Exchange, rendering it independent of London quotations. Germany consumes two-thirds as much spelter as the United States, and considerably more than England, but the price of spelter in Germany has heretofore been fixed in London. The move is therefore a logical one in some respects, but it is much to be regretted that such readjustments of trade relations are resulting from antagonisms aroused by the heat of conflict, rather than from the normal play of economic forces.

THE tin market in Bolivia has considerably improved during the past two months, but in October and November several mining companies suspended operations, so that the tin production has been much reduced. Early in January there was a meeting of the tin producers to consider the offer made by an American smelting concern to buy concentrate. A minimum of 1000 tons per month had to be guaranteed, but the people who were in favor of selling to the United States could not get this quantity together. Señor Patiño did not send a representative to the meeting, and as the whole Bolivian tin output at the present probably does not exceed 1800 tons of concentrate per month, of which about 1000 is produced by Patiño, nothing could be done. Señor Patiño is under heavy obligations to an English firm that is, of course, opposed to affording companies a chance to smelt tin ores in competition with them.

MAIL from northern Mexico, as far south as Durango, is now being received regularly, and with only about one day's delay as compared with normal times. From the southern states the mails are very irregular. A letter from Pachuca was recently almost a month on the road, and even then was sent out by automobile. Pachuca mines and mills are seriously hampered from lack of supplies, though a trainload was received from the north in January. The situation is being met by borrowing and co-operation. Bullion can not be shipped, and money for payrolls is scarce, so that labor troubles threaten. Early in February the Loreto mill was treating about 1000 tons per day, the Guerrero 200, the Santa Gertrudis 400, and La Blanca was running at capacity. Progreso was operating at a reduced rate. Despite the many difficulties with which they are surrounded, the engineers manifest the best of feeling and show that invincible optimism which has been so large a factor in making mining possible in the far places of the world.

IMPORTANT results from the research work on petroleum conducted by the United States Bureau of Mines were announced this week by Mr. Franklin K. Lane, secretary of the Department of Interior. The first is an improvement in refining process which will permit an increase of 200 per cent in the yield of gasoline obtained from crude petroleum, and the second is a method of manufacture from crude petroleum of toluol and benzol (bases for dyestuffs and explosives) hitherto obtained from Germany and made from coal tar. Both processes will be patented for the benefit of the public and are expected to operate to an important degree toward making the country commercially independent. The discoveries are due to Mr. Walter F. Rittman, working in the laboratories of Columbia University. While refining processes capable of yielding an amount of gasoline equal to that proposed have been known, they have been owned by one of the refining companies only, and the new public process will serve not only to equalize somewhat the competition, but also to conserve the supply of oil for the future.

ANACONDA'S GROWTH

That the whole is greater than any of its parts is one of the axioms of mathematics, but the continued growth of the Anaconda Copper Mining Company is steadily making it more important than the Amalgamated Copper Company, which controls it. About five years ago the Anaconda increased its capitalization to $150,000,000 in order to absorb all the Butte properties which had been for some time controlled by the Amalgamated, and the Boston & Montana, Washoe, Trenton, Red Metal, Butte & Boston, Parrot, Colusa Parrot, Original Consolidated, and Alice mining companies, the Big Blackfoot Lumber Company, and the Diamond Coal & Coke Company all became component parts of the Anaconda organization. Last year the International Smelting & Refining Company, which had grown up out of the Amalgamated interests and was controlled by it, was taken over by the Anaconda through a share exchange arrangement. The International, with $10,000,000 of issued capital, owns the Raritan Copper Works, Raritan Terminal & Transportation Company, New Jersey Storage & Warehouse Company, International Lead Refining Company, and the Tooele Valley Railroad Company. The assets of this Company amount to about double its issued capital, of which 43 per cent was then held by the United Metals Selling Company, which is entirely owned by the Amalgamated. The United Metals, with a capitalization of $5,000,000, is the sales organization which markets the metals produced by all the companies mentioned. It is now announced that the Anaconda will carry out its policy of consolidation of management to the logical conclusion by purchasing the United Metals Selling Company from the Amalgamated. This makes the Anaconda a self-contained unit, permitting simplicity of managerial relations from the breaking of the ore in the mine to the final sale of the metal in the market, and should lead to economy of operation. In order to purchase the United Metals the Anaconda has just negotiated the sale of $16,000,000 of 5 per cent two-year notes to the National City Bank of New York. Only a part of the note issue is required for this purpose, and the Anaconda will also take over $12,500,000 of notes of the Amalgamated which mature on March 15. Last week we described in some detail the changes in practice at the Montana properties, which will involve the expenditure of some $6,000,000 for the increasing of the refinery capacity at Great Falls, improvements in the smelting plant at Anaconda, and the construction of flotation and leaching plants there. As an example of the scale on which things are being done, it is interesting to note that the Anaconda has just placed an order for twenty-eight 22½-foot 7-hearth Wedge roasting furnaces, while the reverberatories are being enlarged to a smelting capacity of 650 tons per day each. The excellent metallurgical work which is being done at Anaconda reflects credit on the whole profession in America, and the recently announced promotion of Mr. Frederick Laist is well deserved. Notable results have been also achieved by the safety department, under Mr. C. W. Goodale in the past year.

TUNGSTEN

One of our subscribers writes to inquire regarding the ores, occurrence, uses, metallurgy, and markets for tungsten, and this metal is of enough general interest to justify a brief review of the factors in its production; the more so since the United States is second in the output of tungsten ores, with a production of 1390 tons of 60 per cent concentrate in 1913. The leading place was held by Burma, which between 1910 and 1913 increased from an output of 370 tons to 2900 tons. Portugal is a close competitor of the United States, with 1380 tons in 1913, and, as the industry seems to be growing more rapidly there than here, will probably soon outstrip us.

The commercially valuable ores of tungsten are wolframite, hübnerite, and scheelite, the first is a tungstate of iron and manganese, the second pure tungstate of manganese, and the third tungstate of calcium, all of them containing from 75 to 80 per cent of WO_3. In Burma, wolframite occurs throughout the districts of Tavoy and Mergui in association with cassiterite, and the low cost of labor there prevailing permits the production and delivery to England of 68 per cent concentrate at a cost of only a little over $300 per ton, corresponding to a profit of $180 per ton at a market price of $7.30 per unit (1 per cent) of WO_3. The output of Portugal is chiefly wolframite, and is rapidly increasing. All three minerals are produced in the United States, as has been described in detail by Mr. F. L. Hess in the 'Mineral Resources of the United States for 1913.' The Boulder district of Colorado, which produced two-thirds of the $700,000 worth of tungsten output of this country in 1913, is unique in that the mineral there exploited is ferberite, tungstate of iron, which is nowhere else mined.

The chief use of tungsten is in the form of ferrotungsten for making alloy steels, especially as high-speed cutting tools; 85 per cent of the annual output being devoted to this purpose. The concentrate is reduced with carbon in an electric arc furnace, the resulting product containing 50 to 80 per cent tungsten, and about ½ per cent carbon. The presence of carbon is undesirable, and much study is being devoted to perfecting the process of reduction. Another important use is in the form of wire as the filament in incandescent lamps. For the making of the wire it is necessary to first make pure WO_3 from the concentrate by chemical processes, and the oxide is then reduced at 1000°C. by hydrogen or pure carbon, yielding a grayish black powder which is pressed into bars through which an electric current can be passed, the heat produced sintering the metal particles together so that the bar can be swaged down and finally drawn into wire. The great advantage of tungsten as a material for filaments is that it can be heated to a much higher temperature than carbon without disintegrating, and the amount of light produced increases rapidly with increase of temperature, so that a tungsten lamp produces three times the light when consuming the same amount of current as a carbon lamp. More recently it has been found possible to fill the bulbs with nitrogen, thus removing the small amount of air

remaining in even the most nearly perfect vacuum. This permits the use of even higher temperatures, and these new lamps, which are still somewhat expensive to make, give six times the light for the same current as a carbon lamp. When tungsten lamps were first made, no way was known of consolidating the powder produced by the reduction of the oxide except by making it into paste with a binder. A series of brilliant researches carried out at the Schenectady laboratories of the General Electric Company chiefly by Mr. G. C. Fink, under the direction of Mr. W. R. Whitney, brought about the production of ductile tungsten by the process described, and many new uses are suggested. It has been proposed to erect reduction plants for the manufacture of ferrotungsten in the western states, notably Colorado, but it has so far not been found feasible, as the freight rates to the East on concentrate are low and the rates on ferro-alloys high. Scheelite, which is produced in the Atolia and Randsburg districts of California, the Oracle district, Arizona, and the Snake Range, Nevada, gives trouble in the electric furnace through the production of a sticky basic slag, and therefore commands a price $1 per unit less.

THE STATUS OF THE MINING ENGINEER

The announcement of Mr. Ambrose Swasey's benefaction to promote engineering research was made in New York nearly at the same time as the publication of the fact that the Institution of Mining and Metallurgy in London had been granted a Royal Charter. These two incidents are full of significance. Mr. Swasey gives $200,000 to promote engineering research; himself an engineer, he asks the United Engineering Society to administer this foundation. The gift is made by an engineer for engineers, to be administered by engineers. The United Engineering Society was formed in 1905 to accept Mr. Andrew Carnegie's gift of money for the erection of the building that was destined to be the official headquarters of the national engineering societies. At that time the American Society of Civil Engineers declined to join the joint enterprise because it had a comfortable home of its own already, so that the American Society of Electrical Engineers, the American Society of Mechanical Engineers, and the American Institute of Mining Engineers became the beneficiaries, and victims, of Mr. Carnegie's generosity. In course of time the debt incurred by the purchase of the land on which the building was erected was liquidated by the joint societies, until finally the United Engineering Society owned a commodious and comfortable headquarters in the commercial metropolis. The aloofness of the Civil Engineers caused some heart-burnings, but no enduring ill feeling, among the other three technical societies. This is proved by the present willingness of the Society of Civil Engineers to co-operate with the Electrical, Mechanical, and Mining societies in the administration of the fund devoted by Mr. Swasey "to the greatest good of the engineering profession and to the benefit of mankind." It is hoped, and believed, that his gift will prove a nucleus of a bigger endowment for engineering research, such as will develop into a national establishment to which the newest problems of engineering may be brought for solution. Such and when timely may "help the engine over the centre," as Holley said. It will enable the engineer to formulate problems and so aid the scientist to solve them. An illustration of this great factor in technical progress was afforded in the same week as saw the event we are discussing, for the feat of telephoning from New York to San Francisco, 3400 miles, was rendered practicable by the use of the Pupin coil, the invention of which was due to the clear ascertainment and statement of the essential factors modifying long-distance telephony. That achievement synchronized with the Swasey foundation and pointed the way toward further triumphs in those branches of science that are not least glorious because they are not utilitarian. At the same time, as already stated, the British organization of mining and metallurgical engineers obtained its charter. This came soon after the acquisition of a freehold home in the city of London and served not only to mark the coming of age of the premier mining engineering society in the British empire, but also to signify the attainment of a recognized status. Sad to relate, this honor was obtained in face of sustained opposition on the part of the older society, the Institution of Civil Engineers, which arrogated to itself the position of being the only real thing in professional engineering and attempted to regard the mining profession as a poor, if not disreputable, relative from the country. The absurdity of this pose on the part of the early Victorian representative of non-military engineering will provoke a more ready smile in San Francisco than in New York, and in New York than in London. The charter of the Civil Institution, founded in 1818, ignores mining, which, as an art, antedates most of the other branches of non-military engineering. A recent effort made by this same Institution to ascertain the requirements of engineering education omits reference to the science now applied with worldwide energy to the art of winning the metals, while it has a good deal to say concerning the gasworks, waterworks, railway, dock, and other branches of engineering. The Civil Engineers presented a formal protest against the granting of a charter to the organization of mining engineers both on this occasion and 15 years ago, when similar steps were taken. This time the protest failed, despite sundry statements involving verbal inexactitudes of a regrettable kind. We are glad that it failed. Any attempt to stratify the engineering professions is unseemly and unnecessary. In no walk of life are spurious distinctions of less consequence: it is efficiency and character alone that count. On that score the mining engineer neither claims nor grants precedence. He is engaged in work that involves personal responsibility to an acute degree; he faces moral problems that demand the highest character: he performs services that involve the maximum of technical skill. He has come to his own at last, and he intends to prove himself worthy of the trust.—*T. A. Rickard.*

Chromite Possibilities in California

By SAMUEL H. DOLBEAR

Chromic iron ore, as is true of magnesite and manganese, is widely distributed over large areas in the Coast Range and some parts of the Sierra Nevadas in California. According to Arthur S. Eakle,* it is known to occur in 26 counties. Deposits are also found in Alaska. California production up to the present time has amounted to about 40,000 tons, and while this amount seems large, the California deposits have, as a matter of fact, been a small factor in the markets of the world. The New Caledonia deposits and those of South Rhodesia have been the principal producers of late years. Macedonia formerly mined the largest quantities of this ore, but is no longer an important factor, as producers are unable to compete with operators of other countries. The annual consumption of chromic iron ore in the United States is about 31,000 long tons. The average production of late years has been but 300 or 400 tons per year, and this has come entirely from California.

Chrome ore was first mined in California about 1880. The earliest discoveries were in Del Norte, Alameda, and San Luis Obispo counties. The mines of these and other counties yielded 2000 or 3000 tons per year until about 1895 or 1896, much of the ore being shipped to the Atlantic seaboard and to Europe. Removal of the protective tariff and competition of newly discovered deposits in other countries resulted in the complete closing of the California mines for several years. Operations were resumed in 1900, but it was not until the past two or three years that production has been more than two or three hundred tons per year. On the whole, the future of California chromite is brighter today than it has been for several years. There was mined and sold 201 tons in 1912, and 255 tons in 1913, according to the reports of the U. S. Geological Survey. The figures furnished by the California State Mining Bureau for this period are 1270 tons in 1912 and 1180 tons in 1913.

A CALIFORNIA CHROMITE DEPOSIT.

Just what effect the European war is likely to exert on the California chrome industry is not quite apparent. The countries producing the largest quantities of ore are among the possessions of England, while France is the largest producer of ferro-chrome alloys. No records are kept of ferro-chrome importations, so that the extent of our dependence upon Europe for this commodity is not known. Chromium alloys are manufactured in the United States at Niagara Falls. It may be a significant fact that months before the European trouble broke out, American manufacturers of chrome compounds had

*'Minerals of California,' *Bull.* 67, California State Mining Bureau.

manifested a keen interest in the chrome fields of this state, and representatives visited California investigating the possibility of purchasing ore at this point. Another hopeful phase of the present situation is that those who are investigating the local field with a view toward the manufacture of manganese alloys, are also considering the possibility of a local ferro-chrome production. Furthermore, American brokers have made inquiries in California during the past two years for large tonnages for delivery in both Europe and America.

Uses of Chrome

For convenience, the principal uses of chrome ore may be placed in three classes: (1) refractory, as in the manufacture of chrome bricks, and its use in lining furnaces; (2) metallurgical, as in ferro-chrome and other alloys; (3) chemical, for the manufacture of potassium and sodium bichromate and other salts.

For the manufacture of chrome bricks, ore containing a rather high percentage of aluminum is preferred. Because of their neutral character, these bricks have proved particularly valuable in metallurgical work. They are affected but little by either the basic or acidic materials with which they may come in contact. For all practical purposes, this material is infusible, and has the added advantage of being unaffected by sudden changes in temperature. In some cases, the crude ore is used, pieces of the ore being hammered into place in the furnace and secured there by a binder made up of ore crushed to pass a No. 10 screen, and mixed with tar, molasses, or other volatile substances, and in some cases, small amounts of fire clay. A gentle heat is first applied and then slowly increased until the volatile materials have been oxidized, leaving a solid chromite wall. The life of this lining is said to exceed many times that of magnesite, silica, and other firebrick. Its application is not at all confined to steel practice; it having been successfully used in copper, lead, and other furnaces.

Chromium salts are used largely as dyes, pigments, and in tanning. The principal colors are green, yellow, orange, and red. They are also used as mordants in dyeing. The principal chrome chemicals of commerce are potassium and sodium chromates and bichromates, lead chromate, zinc chromate, chromium phosphate, and barium chromate.

CHROMITE ORE IN SOIL OF THE 'POTATO PATCH,' BLANCHE H. MINE.

Prices and Markets

As in the case of many of the chemical substances produced in California, there is no uniform price for chrome ore. It varies from about $10 to $17 per ton, the sale price depending in a measure upon the point of delivery, but more upon the ability of the purchaser to secure competitive figures. Recent quotations from producers are about $15 per ton on rail at the point of shipment. The

ore is not sold on the unit basis, as on the Atlantic seaboard, and some sales are made in short tons. The prices asked have been somewhat high, and in some cases cheaper ore can be produced. J. S. Diller, of the U. S. Geological Survey, is authority for the statement that California chrome ore cannot compete with foreign ore on the Atlantic seaboard. From correspondence which I have had with eastern chrome users, I feel that this statement is not entirely correct, and prices which have been offered are large enough to permit the shipment of local ore at a profit. As there is considerable variation in prices commanded at eastern seaports, there are undoubtedly times when shipments of California ore would be unprofitable.

Chromic Iron Deposits in California

As stated in a previous paragraph, chrome ore is widely distributed in California. No attempt will be made here, therefore, to indicate each deposit, but a few facts are given with regard to the more important ones. These are of especial interest, as they are the only chrome mines in the United States at present producing ore. A little ore has been mined of recent years in Wyoming, and some high-grade ore has been found in Alaska, but these are not active at this time.

Brown mine.—This mine is about two miles south of Dunsmuir in Shasta county near the Siskiyou county line. From a transportation point of view, its situation is fortunate, being but approximately one mile from the Southern Pacific railroad. Chrome ore has been known at this point for many years. As early as 1885 the manufacture of chromic salts was considered in connection with deposits at this place. The mine is now equipped with a gravity tram about 1600 ft. long, which brings the ore down to a good wagon road leading to the point of shipment. The chromic oxide content ranges from 45 to 55%. About 2500 tons had been produced from this mine up to January 1, 1915. During the past year, L. H. Brown, who has been engaged in the production of chrome ore since 1906, mined 867 tons, of which 567 was sold and shipped. Three hundred tons has been stored at railroad for future orders. The prospect seems good here for further production, the ore occurring in elongated lenses as wide as 25 ft. A series of these lenses has been traced for several hundred feet.

Lesco mine.—Nine claims constitute this property, each of which covers separate lenses of chrome ore. The mines are nine miles nearly due north of Piedra, a terminal point of a Santa Fe railway branch line in Fresno county. The road connecting the mine with Piedra, however, is over 20 miles long, and a portion of it cannot be traversed by wagons during the winter months. A railroad is projected which, if built, would terminate within eight miles of the property, and would be brought within four miles if there could be developed a sufficient tonnage. In the meantime, Clovis, a point on the Southern Pacific railroad, about 12 miles distant, is more accessible than Piedra. The first ore taken from these claims was hauled to the nearby Copper King mine for use in its smelter. Forty or fifty tons was hauled from the Mary Collins claim to the Fresno Copper Co.'s smelter near Academy. The principal development work on this property is on the Mary Collins and Blanche H. claims. On the Mary Collins mine a block about 12 ft. deep, 6 ft. wide, and containing about 60 tons of hard clean ore has been exposed. About 30 tons is also on the dump. Samples taken by me gave the following analysis:

	Per cent.
Chromic oxide	43.21
Silica	6.40
Ferric oxide	7.40
Aluminum oxide	33.80
Magnesium oxide	2.40

With the exception of shipments hauled by wagon to local smelters, all ore shipped from here passed through Piedra. The mine has not been operated since 1913, when about 60 tons was shipped.

On the Blanche H. mine, only small segregated lenses have been exposed. The claim is locally known as the 'Potato Patch,' owing to the fact that hard pieces of ore are found in the soil. These broken pieces of ore frequently weigh several pounds, and are recovered by screening the soil. They occur over 10 or 15 acres, the depth of the soil not being shown by the present workings. This is undoubtedly due to the comparatively rapid weathering of the surrounding country rock and the attendant liberation of lenses of ore. A sample of this ore gave the following analysis:

	Per cent.
Chromic oxide	43.72
Silica	11.70
Ferric oxide	4.30
Aluminum oxide	32.40
Magnesium oxide	1.10

In all of the samples which I took from this section aluminum oxide content is relatively high, a condition which is said to make it particularly adaptable to the manufacture of chrome brick.

Cedar Mountain mine.—Several thousand tons has been shipped from these deposits, which are situated about 14 miles southeast of Livermore in Alameda county. The deposit is about one mile from the Swindell Magnesite Co.'s mine. Of late years, but a few tons has been shipped from here, and most of this was taken from ore left on the dump at the time of closing down the mine. Some of the old workings are still open to a depth of 30 ft., and the drift faces show some ore. About one mile distant, in Devil's Hole, another deposit is said to exist, but this is almost inaccessible and nothing is known of its extent.

Miscellaneous occurrences.—Aside from those mentioned in the foregoing paragraphs, there has been little activity in the many deposits of California during the past year or two. A little development was done in some of the old workings near Santa Maria, San Luis Obispo county, in 1913, but this is understood to have revealed little of interest. Two new deposits of fairly high-grade ore have been lately discovered in San Bernardino county. One of these is situated about 18 miles west of Hesperia, a station on the Santa Fe main line.

about half way between Cajon pass and Victorville. The other is ten miles farther on in the same direction, and is at present not accessible for lack of roads. Analyses of the ore from these deposits made for Alexander Gray showed 45 to 68% Cr_2O_3. An interesting feature of these ores is that they are said to contain $1.20 per ton in gold and 4 oz. silver. As one of the reasons for believing that chrome ore is a segregation from the magma, is the absence of pneumalytic minerals, the study of this deposit should be of particular interest from a geological point of view.

A deposit of high-grade ore, averaging 60% chromic oxide, is reported 20 miles from Coalinga in Fresno county. The mine is accessible by good roads. In 1913 there was a production of 900 tons reported from Calaveras county. The source of this ore is shrouded in mystery, and the brokers handling the output decline to disclose the identity of the mine. It was recently stated that while the rail shipment originated in Calaveras county, the ore was mined in an adjoining county. Chromite is known to occur at several points in this and the five adjoining counties, Amador, Alpine, Tuolumne, Stanislaus, and San Joaquin. In Calaveras county it has been mined in Sec. 20, T. 4 N., R. 11 E., by the Penn Chemical Co. for use in its reverberatory furnaces at Campo Seco. It is also found sparingly at various points in the vicinity of Milton and at Big Trees.

The counties in California contributing chiefly to the production of chromic iron ore in the past are Shasta, San Luis Obispo, Fresno, Alameda, Del Norte, Tehama, Glenn, Placer, Calaveras, Siskiyou, Napa, and Sonoma.

Canadian Minerals at the Panama-Pacific Exposition

Realizing the rapid growth of the mineral industry—a growth that is shown by an increase in the past ten years of 140% in the annual mineral production—the Canadian exhibition commission has made a special feature of the mineral exhibit at the Panama-Pacific International Exposition, and has assembled a really magnificent collection, that is tastefully displayed and carefully ticketed, in the central and south courts of the big Canadian pavilion.

On the left, as one comes into the building from the north entrance, are typical specimens from the mines owned and operated by the Consolidated Mining & Smelting Company of Canada, Ltd., together with the products and by-products of their extraction. This Company was a pioneer in the field of electrolytic refining of lead bullion, and anodes and cathodes are on exhibit showing the various stages of the process, as perfected at Trail, British Columbia. In the next case are to be seen the ores mined by the Granby Consolidated Mining & Smelting Co., of Canada, Ltd., and the British Columbia Copper Co.; these are gold-copper and gold-silver-copper ores, and among them are some massive specimens of chalcopyrite, chalcocite, and auriferous pyrrhotite. With the exception of a few specimens of silver-lead ores in one case, the next five cases are devoted to gold-silver-copper and gold-copper ores from British Columbia, that help feed the before-mentioned smelters; some of the bornite specimens in these cases are of particular interest, insomuch that in some cases they have come from below the 900-ft. level, which would seem to indicate upward enrichment. A case of iron alloys, iron rails and chairs, and pig iron produced by electro-smelting comes next, and is followed by a case containing chrome iron and manganese ores, and another containing iron ores. Next to this comes a case of the famous silver ores from Cobalt, Ontario, where some splendid specimens of native silver heavily veined through smaltite and niccolite are seen; some of the specimens have been cut and polished in order to show the silver to better advantage. The last case on this side of the central court is filled with building and ornamental stones, and contains marbles, serpentines,

slates, and limestones, and some interesting specimens of sodalite and jasper conglomerate. Turning to the left into the south court, the visitor finds a beautiful array of chrysotile asbestos—a mineral of which Canada has almost a monopoly—and asbestos products from Thetford and Black Lake districts, Quebec; and then comes face to face with a moving scene showing, first, a plan of Cobalt mineral claims, then the place where the railroad cutting uncovered the far famed silver veins, and, last, the town of Cobalt as it appears today. Turning from this scene, the visitor sees a large case, over 30 ft. long, in which Canadian coals are exhibited. Here are to be seen large samples from the Lower Carboniferous beds of Nova Scotia and from the Cretaceous beds of Alberta and British Columbia; among the coal are coke, coal briquettes, tar sands, and oil shales, and on the shelves are samples of crude petroleum from the oilfields of Ontario. A companion case to this—behind which are the offices of the mineral department of the Canadian commission—contains some wonderfully rich gold ores from Porcupine and Nova Scotia; gold nuggets from the Klondyke; silver nuggets from Cobalt, one of which, with adhering gangue, weighs 450 lb.; typical gold ores; and cut and polished semi-precious stones. At the end of the court is a scene representing a cave, containing many and varied minerals, and through an opening in which is seen Dawson City, with the midnight sun playing over it. This scene is intended to convey to the visitor the fact that Canada's mineral wealth extends to the Arctic Circle. Continuing the tour of inspection, the nickel case is next in line, and is probably one of the most interesting cases in the exhibit. In the centre is a massive piece of pyrrhotite, weighing nearly one and a half tons, which gives one an idea of the nature of the Sudbury deposits; around it are large pieces of pyrrhotite and chalcopyrite—the typical Sudbury ore—and some of the rare nickel minerals—pentlandite (NiFeS), polydymite (NiS_2), millerite (NiS). Samples from the unusually interesting Alexo mine, in the Nipissing district, also are shown in this case. Besides the ore, the various forms in which nickel is marketed are shown, together with by-products obtained in the process of extracting the metal and articles manufactured of nickel. Leaving the south court and returning again to the central court, another case of building stones is seen, containing granites, marbles, gneisses, serpentines, and sandstones in the form of cubes, with one face polished. A case filled with graphite and products of manufacture comes next, and is followed by one of talc and apatite and one of mica. With the exception of a few samples of muscovite from British Columbia, the mica exhibited is phlogopite, or amber mica, from Ontario and Quebec, which, on account of its flexibility, is in greater demand than white mica for electrical insulation. Clay products, in the form of brick and tile, and cement are given a case, after which comes a case devoted to gypsum and feldspar. Gypsum is one of the staples of the maratime provinces, where it occurs in extensive deposits of excellent quality; it is found also in Ontario, Manitoba, and British Columbia. Besides the ordinary varieties, some beautiful specimens of alabaster, from New Brunswick, and selenite, from Nova Scotia, are on exhibit. Next to the gypsum case is one of corundum, and then one containing molybdenite, stibnite, celestite, barite, and pyrite, followed by a case of 'dry' gold and silver ores from the Yukon territory, another of gold-copper ores from the Nelson mining division of British Columbia, and another of silver-zinc and zinc ores. The last big case is filled with a splendid collection of silver-lead ores, gathered from all parts of the Dominion, but mainly from British Columbia.

Among palms and cycads, in the middle of the central court, are 70 small table cases in which the ores and economic minerals of the Dominion are displayed according to their geographical distribution. Many of these cases will repay the visitor for close inspection, and there will be someone on hand during exhibition hours to give any information that may be desired.

Tonnage of Materials Hauled in Mines

The mine-haulage problem, which is one of the most important features of the mining industry that the mining engineer and the mine manager have to deal with, is seldom given a passing thought by the layman, according to A. H. Fay in a paper to the Washington branch of the Electric Vehicle Association. The quantity of merchantable material handled by the various mines in the United States represents 570,000,000 tons of coal, 50,000,000 tons of iron ore, 75,000,000 to 100,000,000 tons of copper, gold, silver, lead, and zinc ore, and 10,000,000 to 20,000,000 tons of miscellaneous ore, such as phosphate rock, gypsum and other, besides several million tons of clay, sand, and gravel. In addition to this, there are probably 200,000,000 tons of waste material handled annually in the coal and metal mines, making the aggregate amount of ore, coal, and waste rock handled in the mines during a single year in excess of 1,000,000,000 tons. Should an engineering firm be given a contract to remove this material with a time limit of one year, it would have the largest engineering problem ever presented. The work of the Panama canal is cited as perhaps the greatest engineering feat of modern times, yet the amount handled at the canal each year was but slightly in excess of the iron ore and overburden handled in two states, namely Michigan and Minnesota.

INCREASED TAXES are to be levied on Rand mining companies by the Union Government of South Africa, as the revenue is falling short of requirements. The present profit tax amounts to about $5,760,000 per year, and the extra charge will yield $2,400,000 more.

BASE METALS from New South Wales and Queensland are exhibited in the Australian building at the Panama-Pacific Exposition. An excellent model, longitudinal section, of the Broken Hill lead-silver-zinc lode is on view.

Caving System at the Ohio Copper Mine

By F. SOMMER SCHMIDT

The cost of mining per ton at the Ohio Copper Co.'s mine is probably the lowest in the United States. The cost of mining and development for the past three years has been under 25c. per ton, with an average for the past 12 months of 24c., of which 2c. is for development. This includes all costs directly chargeable to mining as shown in the following. The Ohio company has mined 3,056,000 tons since December 1909, so that there is nothing experimental about the system. It can be used anywhere a caving system is applicable.

This system was developed by Felix Macdonald, who learned his business in the Lake Superior iron region, and who was one of the first to apply a caving system in a western metal mine. In perfecting it, Mr. Macdonald was assisted by Fred Turner, who became superintendent of the Ohio when Mr. Macdonald went to the Inspiration copper mine to establish this system with whatever modifications the new conditions required. Since the departure of Mr. Macdonald the system has been improved at the Ohio by Mr. Turner.

Mining Losses

The cheapness of the method cannot be denied. It has been on trial too long to leave any room for doubt. The amount of loss in mining due to ore becoming mixed with capping or overburden is not so definitely settled. This is a criticism that has been frequently made. It is my opinion that there is nothing inherent in the system that should cause any excessive loss. There is, however, a condition at the Ohio mine that would cause a serious loss with any caving system yet devised. This condition is the presence of a caved core in the heart of the mine, filled with capping, broken and ready to flow. This core represents the original higher grade ore that was first extracted, down to the 500-ft. level. Since this first work, which was done under the pressure of its own necessities, all subsequent operation has been in the nature of mining a border or fringe, widening as development progressed. The present ore reserve is partly of this border and partly unbroken ground underlying the cave. Any caving system contending with such an enemy in its midst, should be credited with the disadvantages thus occasioned.

The caved volume represents 4,500,000 tons. The mill has received 3,056,000 tons, to which can be added 100,000 tons in the chutes and some unknown small tonnage that might still be drawn from the cave. These figures would indicate a loss of 25%. I do not consider this a fair criterion of the method. With a new orebody of great extent, where the capping can be lowered uniformly over a large area, the losses need not be any greater than with any other system. Just what these losses are with other systems in operation, I cannot determine, but probably they are higher than was originally estimated.

To be frank, there is not a big low-grade mine in the country that would not be glad to take 25% loss in tonnage if the mining cost could be reduced to say 25c. per ton. I naturally make a distinction between mining and quarrying. Properties of this nature are all looking for profits and not conservation of resources for posterity. With the Ohio company it has never been a question of tonnage so much as a life and death grapple with other things. When these are taken into consideration, as they are in all low-grade mines, the amount of mining loss becomes less important than would appear at first sight.

General Features of the Mine

The Ohio orebody so far as developed is a zone 450 ft. wide between two strong fissures, extending from the 100-ft. level down to the Mascotte tunnel level 1300 ft. on the dip of 50°. This orebody is fractured quartzite with some monzonite. It caves well and also stands well. This fractured condition is an advantage, though not of such moment as appears at first sight, as the fractured condition can be obtained in any case by using a heavier overburden. The presence of the Mascotte tunnel below the ore with its electric transportation to the Ohio mill is also an advantage, as there is no cost of hoisting ore.

There are levels at 100, 300, 400, 500, and 750 ft., connecting with the shaft, which is used only for handling men, tools, and equipment. Sub-levels between the levels are now being spaced 60 ft. instead of the original 30.

Details of the System

The outstanding features of the system are:

1. The use of inclined rises, there being no vertical rises in the mine.

2. The blocking out of the ore into 20 by 50 ft., measured from centre to centre of drifts and cross-cuts which surround the blocks. Blocks 100 by 100 ft. are mined as units when possible. Blasting is confined to the levels or sub-levels.

3. Numerous rises undermining the blocks, 150 rises to a unit of 100 by 100 ft., which receive the broken ore.

4. Every level or sub-level is blasted instead of alternate ones, bringing down the honeycombed block above it 60 ft. high.

5. The ease of controlling 45° chutes which have tenders giving them personal attention at points a few feet under the level.

6. That 20% of the ore is extracted in drifts and cross-cuts and rises at an average cost of 79c. per ton, while 80% caves at a cost of 6.8c. per ton, making an average cost of 22c. per ton.

The ore on a level or sub-level is divided into blocks

20 by 50 ft. with drifts and cross-cuts. These workings are 6 by 7 ft., and cost $3.25 per foot or $1 per ton. They are driven at the average rate of 3 ft. per day, using a one-man Ingersoll or Holman drill. Every block of 100 by 100 ft. requires 700 ft. of these workings, which represents 2450 tons. These blocks are drilled with a two-man Ingersoll drill. The set-up spacing is 9 ft., making 11 set-ups for every 100 ft. From each set-up in the drifts there are drilled three 10-ft. holes and four 8-ft. holes, one vertical and three on each side. From each set-up made at the junction of a drift and cross-cut and set-ups made in the cross-cuts only the three back holes are drilled. (See Fig. 1 and 2.) An 8-ft. hole from one side will sometimes intersect the corresponding hole from the other side of the 20-ft. block, which, after deducting the width of the drift, is only 14 ft. thick. Two men can drill the holes of a set-up in one shift.

Each hole is loaded with 8 sticks of 1¼-in. E. L. F. Hercules, 40%, extra low freezing, dynamite. A block 100 by 100 ft. will thus require about 36 boxes of powder. The holes are blasted with caps and fuse, using 6-ft. fuse in the back holes and 5-ft. in the 'down' holes. When blasting a level, the fuse is all ignited simultaneously, the 'down' holes going off first with shorter fuse. One man can tend to lighting about 21 holes or three set-ups.

The result of this blast is the shattering of the whole block 100 by 100 ft. as a unit, which fills the open spaces of drifts and cross-cuts and in subsiding allows the block above 60 ft. high to settle. This block above has been pierced with rises which served the purpose of tapping the ore above, just as the rises below the level just blasted are going to tap this block. The rises have extracted about 15% of the volume of the block and thus give scope for the crushing forces of the mass.

The operations, therefore, that do the work are: (1) shaking up the block on the level; (2) extracting 5%

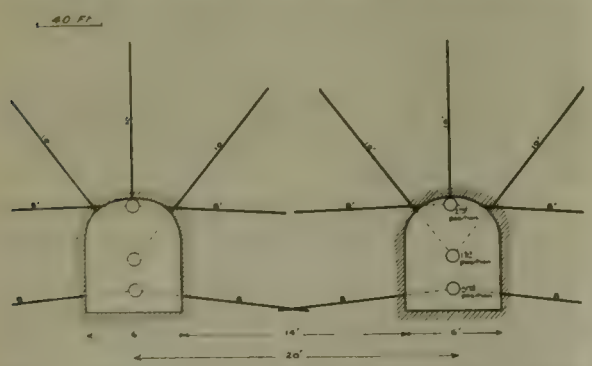

Fig. 1. Section showing drill holes for blasting a 20 by 50-ft. block.

of the mass on the level and 15% between the levels; (3) having a sufficient crushing force of overburden.

Three main chutes ultimately deliver all the ore and lead to the bins on the Mascotte tunnel. These chutes are cribbed, lined with rail, and measure 4 by 4 ft. inside the cribbing. These chutes, like all the rises in the mine, are on a slope of about 45°—never more than 50° and never less than 42°. Only the main chutes are timbered.

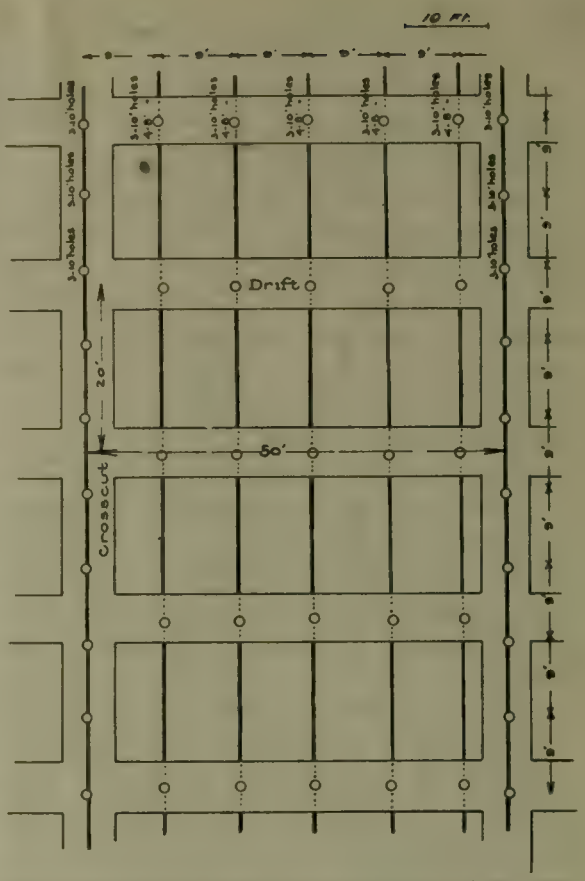

Fig. 2. Showing drill holes for blasting blocks 20 by 50 feet.

Branch chutes are driven from the main chutes, so as to reach a point on the sub-level below the block to be mined, at a point exactly under the centre of the block. A grizzly having 12-in. openings is placed at this point, which then becomes the control for the entire block. Branch chutes from this grizzly are extended to the corners of the 100-ft. block, and these branch chutes then become the main channels for a system of minor rises so placed that their collars are spaced 10 ft. centres uniformly over the entire area at the base of the block to be mined, or in other words, at the level or sub-level above. With the desired positions of the collars in mind, it becomes a question of determining at what point of the branch chute to begin radiating. Numerous rises will be driven from the same point and may look something like the ribs of a half-opened umbrella. Again, it will be necessary to start the radiating rises from some point not in the branch chutes, but from some point on another rise which itself is a radiation from some branch chute. As these rises are all on a slope of 45° there is considerable crossing back and forth, above and below each other in the

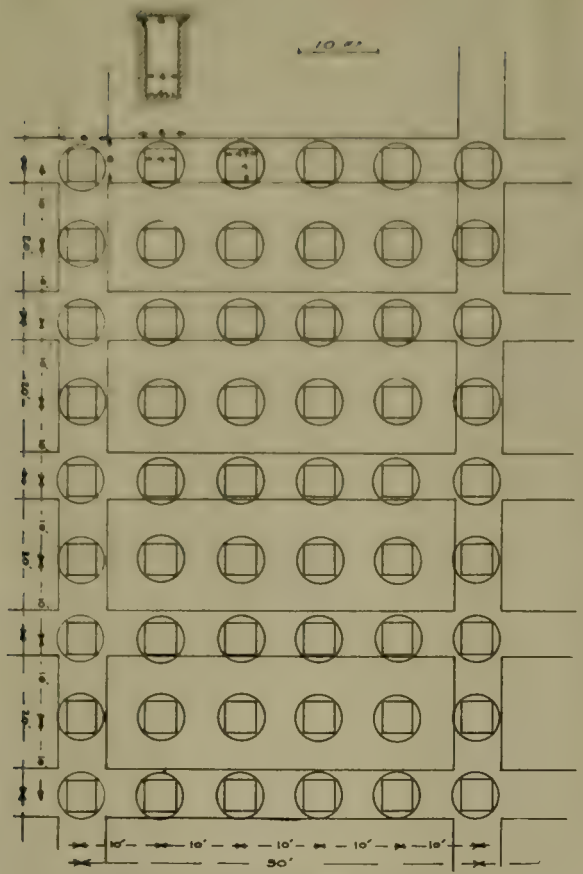

FIG. 3. SHOWING COLLARS OF RISES IN RELATION TO BLOCKS 20 BY 50 FEET.

planning of these rises. There results a system of ramifications much after the manner of the spinal cord with its system of nerves. Fig. 4 and Fig. 5 show such a system of rises in plan for a 100-ft. block. This plan has not been taken from the actual procedure in any one given case, but is typical of the system in general. While there appears to be no symmetry or regularity, this is due to the elasticity of the system, and the planning of these rises will be largely determined by the presence and situation of rises already driven for prospecting or development which can be impressed into this new service by properly adjusting the following plans. All rises driven for prospecting purposes have a slope of 45°, so that in course of time they will fit into the general scheme. Of course, the correspondence is not exact, but this makes little difference, as already indicated, as these openings serve to loosen the ground.

These rises are all 4 by 4 ft., and cost $1 per foot or 75c. per ton. The progress required of the men is 5 ft. per shift. In the short rises it is common to shoot twice a shift, making an average of 7 ft. per shift or 14 ft. per day. Hammer drills are used in the rises, and naturally there is no shoveling. In actual operations about six or seven rises are being worked at one time. It takes about two months to do the rising for a 100-ft. block.

CHUTES

There are usually about 150 rises to a 100-ft. block. The actual number called for with 10-ft. spacing is 121, but many of the collars become connected in two ways where such connection is very short and can easily be made. This gives a little elasticity in controlling the direction of flow.

After the level has been blasted it will be found that a large number of the chutes will not flow. Provision has been made for this by having drilled a round of 5 to 7 holes, 4½ to 6 ft. long, into the solid block at the tops of all rises before leaving them. Any of these can now be loaded and blasted, thus starting the flow at that point. In order to assist the flow the collars of the rises have been expanded like a funnel. In this way all the chutes are started and each one contributes its share.

The chute gate controlling every one of the rises is placed as closely under the level as possible in order to keep the capping from descending any farther than absolutely necessary. If the capping is allowed to descend

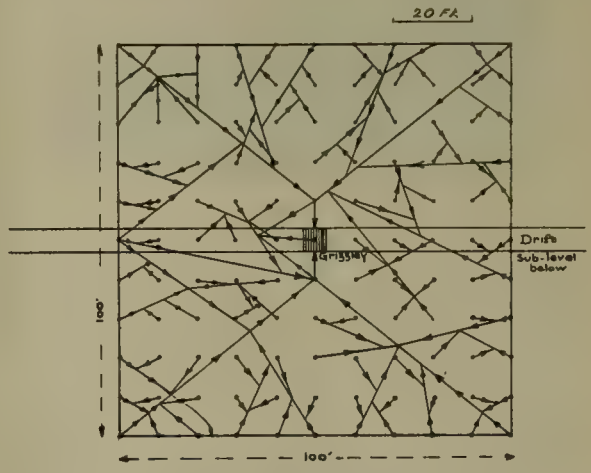

FIG. 4. PLAN SHOWING SYSTEM OF 45° RISES FOR A BLOCK 100 BY 100 FT., AND 60 FT. THICK.

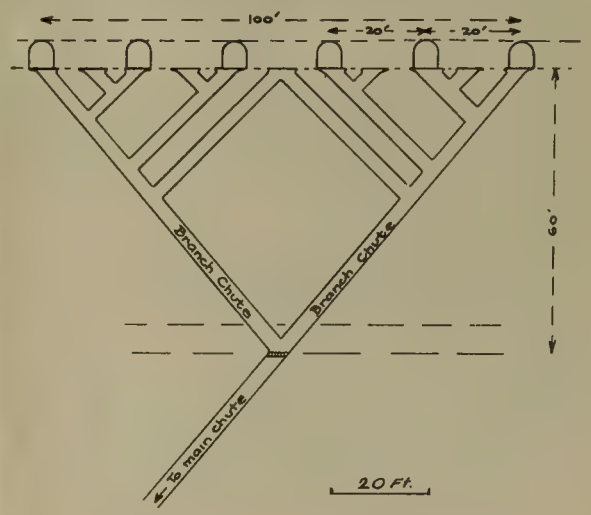

FIG. 5. SECTION SHOWING GENERAL SCHEME OF BRANCH RISES.

say 6 ft. in each of the 150 rises, it is manifest that a 10% slice will be lost when this block is caved. It will be lost because, having become mixed with capping, both will be rejected together. The present system of 60-ft. sub-levels, therefore, is an improvement over the original 30-ft., as this loss is occasioned only half as often. The chute timbers are therefore put right at the level and the gate only a few feet below.

All the rises from the block lead to a single grizzly on the sub-level below. To tap the chutes, and control the day's output, of perhaps 2500 tons, only 4 men per shift are required. When running freely, any chute will average 100 tons in 5 minutes. Not more than 50 tons is drawn from any chute at one time. A tag stating date, shift, and the tonnage drawn is attached to

OHIO COPPER CO. MILL.

each chute. Two men, with the occasional assistance of a boss, draw all the tonnage. One of these is at the grizzly and keeps the traffic clear with the aid of hammer and bar. The other, tending a chute, manipulates his gate, and has the opening constricted down to 2 by 2 ft. With bar, hammer, and drill steel, he attacks any oversize that clogs the chute. 'Bulldozing' is ruinous to the chute timbers and against orders. With the aid of his watch the tender estimates his 50 tons, with surprising accuracy, after which he drops his plank and tallies the tonnage on the chute record. It will be noted that a 45° chute is easily controlled.

Below the grizzly there are two men who tend to the rises and chutes down to the Mascotte. They keep the traffic open by patrolling the main arteries. Two men load the trains at the pockets in the Mascotte tunnel through which the ore is trammed to the mill at Lark, shown in the cut above.

Costs

In order to mine a block 100 by 100 by 60 ft. deep, which represents 50,000 tons, the following work must be done:

			Tons.	Per ton.
Drifts and cross-cuts..	700 ft. at	$3.25 = $2275	2,450	$0.93
Rises	6000 "	1.00 = 6000	8,000	0.75
Total and average		$1.24 $8275	10,450	$0.79

The cost per ton of mining the entire block then is:

Excavated	10,450 tons at	$0.79 =	$ 8,275	20.9% of tonnage
Caved	39,550 "	0.068 =	2,725	79.1% "
	50,000 tons		$11,000	

Average per ton, $0.22.

This cost per ton may be distributed as follows:

	Per cent.
Superintendence	8.2
Office	1.1
Technical engineers	3.9
Hoisting	4.1
Blacksmithing	2.5
Carpenter shop	1.8
Miners and shovelers	27.7
Timbering	7.0
Chute tending	8.1
Powder-men and roustabout	1.1
Loading trains	4.1
Supplies and power	30.4
Total	100.0

Profits of the Rand Mines, Ltd., Subsidiaries

The estimated profits for January, compared with those in December, are as follows:

	January.	December.
Modderfontein B.	£47,420	£44,699
New Modderfontein	62,317	57,542
Rose Deep	19,905	21,251
Geldenhuis Deep	9,220	9,531
Nourse Mines	9,697	11,906
City Deep	37,348	41,102
Village Deep	21,748	26,632
Ferreira Deep	45,955	26,650
Robinson	42,577	41,439
Crown Mines	70,072	74,070
Bantjes Consolidated	6,556	824
Durban Roodepoort Deep	2,804	5,207

In the Crown Mines the grade continues below what is called for by the estimated value of the ore reserves which are being mined. The cause of this difference is being carefully investigated. The supply of native labor is rapidly improving. There was an increase of over 1100 in the number of Kaffirs employed by the Company during January, and it is confidently anticipated that this will lead to a substantial increase in the tonnage treated in the course of the next few months.

The Bantjes Consolidated had a loss of £6556, due to the Central shaft breakdown. Repairs are progressing satisfactorily, and two hoisting compartments were expected to be completed during February; but a loss should be anticipated for that month.

Gold exported from the United States in the year 1914 totaled $242,711,000. Of last year's total, about $113,513,000 went to Ottawa on account of the Bank of England. Imports into this country during 1914 totaled $58,122,000.

Gold production of Rhodesia in 1914 was worth £3,580,207, against £2,903,267, £2,707,368, and £2,647,894 in the three previous years. There were 202 mines yielding metal.

Metallurgical Practice in the Porcupine District

By NOEL CUNNINGHAM

*Many excellent descriptions of the mills of the Porcupine district have been written, but no discussion exclusively devoted to the metallurgical technology has been given. These notes are intended to cover this feature briefly. They are based upon 2½ years' mill operation in the district; that is, practically since the beginning of metallurgical operations.

Character of the Porcupine ore.—There is no oxidized ore in the district, the surface having been deeply planed by glacial action in recent geologic time. The precious-metal content is about in the proportion of 85 of gold to 15 of silver by weight; hence, the silver is practically negligible. There are two classes of Porcupine ore, having very different characteristics; these will be referred to through this paper as class A and class B.

Class A ore is a pure quartz with inclusions of schist. Generally it is heavily fractured and breaks down readily to sharp hard grains, about minus 10 plus 20 mesh, requiring further comminution to release the gold. It contains little pyrite; the gold is entirely free and inclined to be coarse, but often spongy, going into solution readily on that account. This gold is 60 to 85% free milling, depending on the grade of ore.

Class B ore is an iron silicate schist, strongly laminated, containing 4 to 5% pyrite; its specific gravity is 2.8 to 3, depending on the amount of mineralization. In breaking the ore in the mine, generally over 25% of material through a ½-in. ring is made; the ore readily breaks down in milling and makes a comparatively large amount of non-crystalline slime; owing to its high specific gravity, however, it is quick settling. In my opinion, the gold in this ore is free, but so finely divided that it will neither pan nor amalgamate; it appears to be disseminated through the rock and not chiefly associated with the pyrite.

Veins of class A ore occur with or without side walls of class B, and veins of class B occur unassociated with class A; more often the veins are closely banded, class A and class B alternating, generally with class B in excess. Both classes of ore are more or less blocky at times, and with reference to class B this is indicative of low gold content.

From a treatment standpoint neither class of ore introduces any important difficulty, although there seems to be a tendency toward re-precipitation, due probably to some element in class B material. Practically no cyanicides are present in the ore, chemical consumption being about 0.2 lb. of cyanide per ton of ore; 1-lb. cyanide solution is sufficient for extraction, and protective alkalinity may be carried very low. With a well designed battery and tube-mill installation, a stamp duty of 15 tons or better can be readily maintained.

*Abstract from *Trans.* A. I. M. E., New York meeting, February 1915; presented also, by joint agreement, before the Canadian Mining Institute.

Outline of Treatment and Development at the Principal Mills

It will be of benefit to outline the treatment in the five principal mills of the district in chronological order, and to comment briefly on the metallurgical trend indicated.

First Hollinger mill.—Destroyed by fire before ready to operate. Treatment intended: fine crushing, plate amalgamation, and concentration of tailing.

First McIntyre mill.—Designed for treating class A ore. Crushing by 10 light stamps, fine grinding, plate amalgamation, and concentration of tailing from amalgamation. As the mine developed, chiefly class B ore was produced, from which good extraction could not be made by amalgamation. This mill was shut down after about a year's run.

Vipond.—Mill of 100 tons capacity treating a mixture of class A and class B ore. Treatment: fine grinding and plate amalgamation. Simple amalgamation did not make satisfactory recovery of the gold and the mill was shut down after a few months' run. Recently the mill resumed operation, amalgamation having been abandoned and a cyanide plant added. Treatment: fine grinding in cyanide solution, agitation, and complete counter-current decantation.

Dome.—A 40-stamp mill, recently increased to 80 stamps, treating a mixture of class A with a less amount of class B ore. Treatment, at start: stamping in water, primary amalgamation, fine grinding, secondary amalgamation, dewatering, agitation in cyanide solution, Merrill filters, to waste. Later: stamping, tube-milling, and plate amalgamation in water, cone classification to three products; (*a*) slime, dewatered and agitated in cyanide solution, Merrill filters to waste; (*b*) sand, leached; (*c*) concentrate, reground in tube-mill in closed circuit with classifier and amalgamation plate, classifier overflow to slime treatment.

Hollinger.—A 40-stamp mill, recently increased to 60 stamps, treating a mixture of class A and class B ore, the latter predominating. Treatment at start: stamping in solution, fine grinding, concentration, concentrates amalgamated in solution and returned to table tailing, table tailing to agitators, to Moore filter, to waste. Later: stamping in solution, fine grinding and concentration, concentrate agitated in strong solution, washed and impounded; table tailing to two steps of continuous decantation, to filters, to waste. Now building: plant for agitation and complete counter-current decantation for one-third of the tailing from table concentration.

Porcupine Crown.—Plant with 10 light stamps, later increased to 20, treating class A ore entirely. Treatment at start: stamping and fine grinding in water, fol-

lowed by plate amalgamation. Later: stamping and fine grinding in solution, with plate amalgamation in closed circuit with tube-mill and classifier, followed by agitation and complete counter-current decantation.

Second McIntyre mill.—Plant of 150 tons capacity, recently increased to 300 tons, treating a mixture of class A, with large preponderance of class B ore. Treatment at start: fine grinding in solution, agitation, Burt filter to waste. Later: the capacity was increased from 150 to 300 tons, the treatment being unchanged except that continuous decantation replaced filtration in the new unit.

Acme mill.—Now building with 40 stamps, to treat a mixture of class A and class B ore, the latter predominating. Treatment: stamping and fine grinding in solution, agitation, concentration, concentrate to be reground in solution, agitated, washed and impounded, table tailing to be treated by decantation.

Analysis of the Milling Practice.

A tendency toward extensive alteration in treatment methods will be at once apparent from a consideration of the above outline of milling practice and development. This is chiefly due to the fact that large bodies of class B ore are now being developed and treated, whereas the design of most of the mills was determined almost entirely from tests upon class A ore. The entire failure of unaided amalgamation is obvious. Amalgamation in conjunction with cyanidation is practised only at the Dome, where large bodies of class A ore are yet to be treated, and at the Porcupine Crown, where to date only class A ore has been found. At the latter mill, however, only a small plate area is used in the classifier tube-mill closed circuit, as the ore contains a large amount of coarse free gold which is readily caught at this point.

The equipment at the Porcupine mills offers good opportunities for comparison of various machines for doing the same work.

Stamps v. rolls and Hardinge ball-mills.—At the Vipond and the McIntyre mills, rolls and ball-mills are doing the work done by stamps at the other mills. The ore is chiefly soft schist and the ball-mills have been entirely satisfactory; power per ton of ore ground appears to be slightly higher with stamps for the production of identical results. Steel consumption is about the same, the stamps perhaps having slightly better efficiency in this respect; cost of operation and repairs is in favor of the ball-mill, while first cost and uniformity of operation (what might be termed lack of operating 'grief') are decidedly in favor of the ball-mill. While my own experience in the district has been entirely with stamps, and their performance was satisfactory, I am of the opinion that the ball-mill is preferable for breaking down the Porcupine ore ahead of the tube-mills.

It may be of interest to note, in passing, that at the McIntyre a first-class Chilean mill was discarded in favor of the ball-mill after the two had run side by side for a year. At the Vipond, Hardinge pebble mills are used for fine grinding, while cylindrical mills are in use in all the other mills. I do not know how the conical mills compare with the cylindrical mills in first cost, power required, performance, etc., but on theoretical lines I favor the cylindrical mill, where coarse gold is to be dissolved in solution, as more effectively trapping the gold particles and wearing them down to microscopic fineness, owing to the vertical end of the mill.

Stamping in water and amalgamating v. stamping in solution with no amalgamation.—Probably the best opportunity for studying this point is afforded by a comparison of the Dome and Hollinger practice. The advantages claimed for stamping in water and amalgamating are a better recovery of the coarse free gold and the saving in treatment cost, due to a smaller amount of solution to precipitate and a smaller amount of precipitate to handle. At first sight it would also appear that a saving in dissolved losses from the filters would be made, owing to the smaller amount of gold in solution going to the filters.

While at the Hollinger there is a smaller percentage of amalgamable gold in the mill heads than at the Dome, on the other hand, the coarse free gold per ton of ore in the mill heads is about the same, due to the fact that the head assay is nearly triple that of the Dome. Hence, if amalgamation is necessary in order to assure the dissolution of coarse gold in cyanide solution, difficulty from this source should be experienced at the Hollinger, where crushing is done in cyanide solution, with no amalgamation following.

This is not the case, however; all the coarse gold goes into solution in the classifier tube-mill closed circuit. This is proved by two facts in connection with the Hollinger operations. Table concentration after fine grinding is practised at the Hollinger, and any coarse free gold passing the tube-mill classifier closed circuit would be caught on the tables. No coarse gold is present in the table concentrate, however, no color of free gold ever showing on the tables; also practically no amalgam was produced (under 1% of the total value recovered) during six months pan-amalgamation of concentrate from the tables.

Facts also indicate that crushing in solution without amalgamation shows the best results in regard to amount of solution precipitated and dissolved gold mechanically lost. With the head assay at the Hollinger about three times as high, the precipitation ratio is only about twice that at the Dome, and the mechanical loss of dissolved gold and cyanide only about one-half. Nor is any saving in dissolved losses or treatment cost proved in favor of crushing in water followed by amalgamating. On the other hand, there are added to the treatment cost, (1) cost of amalgamation, (2) cost of increased cyanide consumption due to 'waste' solution precipitated and thrown away, and (3) in winter the cost of heating to mill temperature the quantity of water—equaling several times the weight of ore treated and introduced at nearly a freezing temperature—to replace the water and waste solution discharged with the tailing, which would not be necessary if crushing were done in solution. The

loss of gold left in 'waste' solution after precipitation must also be added to the cost.

In comparing Dome and Hollinger metallurgical practice, it is only fair to state that since the Dome ore is harder and more compact, the gold may be less spongy and therefore less amenable to cyanidation. The only deduction which can be drawn from the facts, as far as I know them, is, that apparently in treating average and low-grade ore of the district, amalgamation can be eliminated; that if amalgamation is eliminated and solution introduced at the stamps, a considerable saving in operating cost, cyanide, and dissolved gold losses is possible.

Unquestionably, more extensive study has been given to the treatment of the Dome ore than to any other in the district. Hence one hesitates to make what may appear to be a criticism of an operating system probably justified by a careful balancing of co-ordinate factors by an eminent firm of metallurgists. However, no metallurgical discussion would be complete without touching upon this point, which is the salient difference between the two metallurgical systems of the district.

Concentration v. non-concentration.—The Hollinger is the only mill employing a table concentration. About 16% of the gold in the ore is recovered in the concentrate, and the advantages claimed would indicate that the possibilities justify careful consideration. The pulp, with the concentrate removed, needs much less careful treatment than the entire pulp, concentrate included, would require, hence a small tonnage of concentrate may be given whatever treatment it demands to get the best result, while the large tonnage of pulp free from concentrate may receive the much smaller amount of attention it requires.

Table concentration at the Hollinger costs about 5c. per ton of ore treated, and recovers about 80 lb. of concentrate per ton of ore, assaying about 2½c. per pound, worth, therefore, about $2. In the careful treatment given the concentrate the value per pound of concentrate is brought down to about 0.3c.; in other words, a saving of $1.76 is made from the 80 lb. of concentrate from each ton of ore, which is a large enough amount to warrant the expenditure of 5c. to safeguard. The performance of the thickeners and filters is improved if a feed can be maintained composed of particles of one specific gravity, so that from the standpoint of better mill performance, due to keeping the concentrate out of the thickeners and filter, I am of the opinion that the expenditure of 5c. per ton of ore is justified where the concentrate taken out amounts to, say, 4% or more of the total tonnage. Another advantage is that even after a very careful treatment the concentrate tailing assays from $5 to $7 per ton of concentrate, equal to 12 to 20c. per ton of ore. Also the saving in treatment cost, due to the less agitation required for the pulp freed from concentrate, should be credited to concentration. Hence, I should say that if table concentration cost 20c. per ton, instead of 5c., it would still be justified when a considerable amount of class B ore is to be treated.

Agitation.—The ore particles composing the pulp coming to the agitators are extremely quick-settling and largely granular, after only a few minutes' shut-down the pulp compacts solidly in the bottom of the agitator so that, mechanically, agitation is a difficult problem. At the Dome four Pachucas in series are in operation, but all the other mills use the Dorr agitator, which seems to be peculiarly adapted to the local requirements. From the trouble experienced in keeping the Hollinger pulp in suspension in the filter-loading vats, I judge that the Pachuca agitator is expensive in power required to prevent the filling up of the cone. With a trifling amount of power and a normal air consumption the Dorr agitator meets all the mechanical difficulties.

Metallurgically the quicker-settling particles need longer treatment than the lighter material. Selective agitation of the quick-settling particles is therefore essential if the best results are to be obtained.[1] The Dorr agitator, allowing as it does control over the rate of flow through the tank of material of greater or less than the average settling rate, meets the metallurgical requirements of the ore.

Filter methods of the district compared.—The Merrill filter is in use at the Dome, and while direct treatment in the presses has been tried, it has been found that the use of agitators for the dissolution of the precious metals is preferable, as a very large and expensive filter installation would otherwise be required. The Moore filter at the Hollinger has indicated that the ore contains such a large proportion of quick-settling material that vacuum filtration is not altogether satisfactory. In the loading vats, six air-lifts are used, requiring 40 hp. at the compressor, and even with this intense circulation the heavy slime accumulates on the 60° hopper bottoms, resulting in such damage to the leaves that about one-third of the filter-operating cost is represented in repairs to filter-leaves. Then, too, with the strong circulation, due to the air-lifts, the cakes are channeled and uneven. On the whole, I do not consider that vacuum filtration is adapted to the Porcupine ore.

At the McIntyre mill, a Burt filter is doing good work and is stated to have been entirely satisfactory. At the Hollinger and the McIntyre mills, the pulp from the new sections will be treated by continuous counter-current decantation, while the pulp from the original sections will continue to be put through the filters, so that shortly some interesting comparative figures on the two methods should be available.

Continuous counter-current decantation.—It has been previously mentioned that no oxidized ore occurs in the district, and the clean undecomposed rock breaks down to give an ideal product in the thickeners. Class A ore makes no colloid, and class B ore, while grinding to an extremely fine, amorphous product, gives little trouble in settling, owing to its high specific gravity. Class A ore can be thickened to 30% moisture and class B to 35 to 45%, depending upon the percentage of concen-

[1]For an exposition of the term 'selective agitation,' see the paper by J. V. N. Dorr, in *Bulletin* No. 92, p. 2072 (August 1914).

trate. The critical moisture is 45%, when 5% of concentrate is present, and about 35% moisture with class B pulp, free from concentrate. On account of being able to get such unusually low moistures in the thickeners, a very high recovery of dissolved metals is possible by continuous decantation. Also, the fact that the cyanide strength of the solution from agitators to thickeners need only be carried at slightly above 1 lb. per ton favors the decantation system, where the mechanical loss of cyanide is generally higher than in ordinary filter practice. At the Porcupine Crown, with about $13 going into solution per ton of ore, and using four steps of decantation, with no filter, the dissolved gold loss is only 5c. and the mechanical loss of cyanide only 0.32 lb. per ton of ore.

The Hollinger mill put in two steps of continuous decantation early in 1913, and the complete counter-current decantation system was installed in the cyanide extension of the Porcupine Crown later the same year. Later still, the Vipond installed the counter-current decantation system, as did the McIntyre when the mill was enlarged. The Hollinger has a complete 300-ton plant under construction and the Acme mill a 600-ton plant, both to use this system.

Mill design.—The proper design for a mill treating Porcupine ore will depend upon the proportions of class A and class B ore to be handled. Unless there is to be a large excess of class A ore, amalgamation may be dispensed with, as the recovery by amalgamation will not warrant its use. If class A ore were in large excess it would still be an open question, but from a recovery standpoint amalgamation is unnecessary.

The Hardinge ball-mill may not show up as well on class A as on class B ore, but I am inclined to think that it would. With an excess of class B ore the ball-mill will be superior to stamps. I am of the opinion that a cylindrical tube-mill should be used for fine grinding, rather than a conical mill, if only for a theoretically better dissolution of coarse gold.

For the treatment of any considerable proportion of class B ore, table concentration, with separate treatment of the concentrate, will probably pay.

Agitation should be arranged to be continuous, preferably in a series of flat-bottomed agitators, allowing a preferential treatment for the quicker-settling portion of the ore.

If filtration is used, a pressure filter will be more satisfactory than a vacuum filter; however, the ore is so perfectly adapted to continuous counter-current decantation that this would seem to be the proper treatment.

On account of the severe winter conditions and the high cost of fuel, the object to strive for in the design should be as compact an arrangement of the equipment as possible, so as to minimize the cubic content of buildings to be heated.

In the district, the water supply is ample, the sites for mills are good, and the facilities for convenient tailing disposal are adequate. It is interesting to note, finally, that this is the only important gold-producing district near the Atlantic seaboard.

Practical Points on Sampling

By ARTHUR FEUST

Undoubtedly most of the following is an old story to experienced engineers, but for the benefit of the younger members of the mining profession I will describe some of the practical details to be observed in taking and cutting down samples for mine valuation as well as for metallurgical tests. Some of these details I have learned from other engineers and others I have myself devised.

On arriving at any property, after looking over the property, maps, and calculating the footage to be sam-

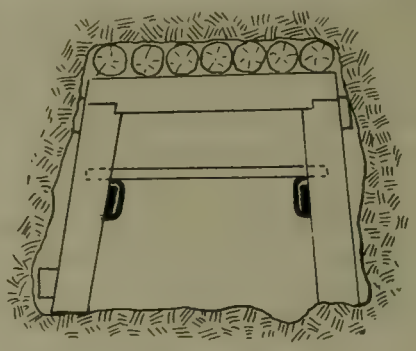

FIG. 1.

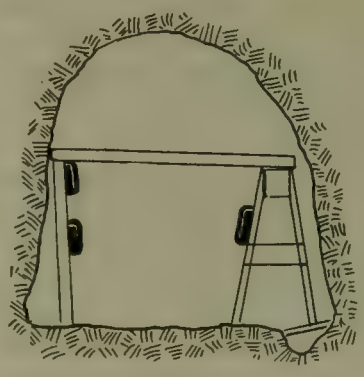

FIG. 2.

pled, it is advisable to make a pick analysis (see 'Mine Sampling and Valuation,' by C. S. Herzig), together with horn spoon tests in order to determine the character of the ore to be sampled before deciding on the sample interval, as well as whether the samples are to be taken as a unit or in sections across the orebody. By so doing, one will often save time and money for the client in subsequent operations, as long stretches of barren ground can be eliminated, thereby allowing closer sampling in the ore-shoots proper and giving greater accuracy.

Once the sample intervals and other questions have been decided and the actual work of taking the sample is under way, watching minor details, such as (*a*) temper of gads, (*b*) staging for high places, and (*c*) quantity decided to cut per foot sample, will greatly expedite further operations. By trying various tempers of steel

(marking the gads for identification of temper) for the first day or so, the exact temper for any particular rock may be determined, for what may answer best in one mine will be useless in another. For staging, no fixed rule can be given, as this depends on the ingenuity of the individual. Two of the simplest devices are sketched below, one for timbered, the other for untimbered ground. The quantity to cut per foot depends on facilities at hand and whether samples have to be transported any distance, for the reduction of big samples in out of

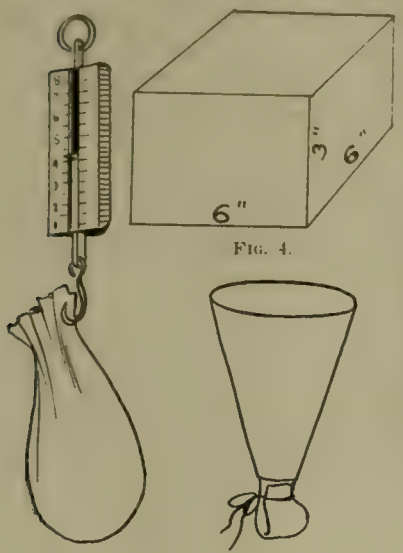

Fig. 4.

Fig. 3.

Fig. 5.

Fig. 6.

the way places with poor facilities is a problem in itself, being costly and tedious. In order to keep within bounds I have found that it is advisable for the first few days to use either a spring balance with a hook attachment (see Fig. 3), or a standard volume (see Fig. 4). Of these two, I prefer the spring balance, because it is simple and more accurate to gage the sample by weight than by volume, for by the latter method the sample will vary according to the size of the particles chipped off, the packing down into the standard volume, and the porosity of the ore sampled, besides involving a double transfer from the receptacle in which the sample is cut to the standard volume and thence to the sample sacks.

With regard to the various devices for taking or, rather, catching the sample, I have found nothing as satisfactory as the open canvas cone device shown in Fig. 5. It is simple, easily made, and offers the least chance of salting by retaining particles from one sample to the next. It can be throttled to avoid excess of material from any particular point, and has the great advantage that the material can be easily transferred to the sample sack without danger of spilling. As seen in the sketch, it consists of a heavy wire ring, over which the truncated canvas cone terminating in a small open cylinder can be sewed. The lower end is double and fastened with a simple surgeon's knot when in use. However, this device, like the canvas bucket and candle box, is open to the objection that clayey or wet material adheres to it and is apt to cause a great deal of lost time in cleaning and a possibility of salting. For material of the character above mentioned, I have found satisfactory one half of a 5-gallon kerosene tin with the sharp edges doubled over, using a few drops of kerosene to prevent the material from sticking (apologies to C. H. Wray of the Bewick-Moreing staff), as nothing adheres to this if the kerosene is renewed occasionally. Once the tin is abraded and corrodes it becomes useless, but a new one is easily procured.

Reducing samples. At this point in the operation I have seen many a sample ruined through haste and carelessness. A little more time and care expended adds greatly to the accuracy, especially in breaking up the larger pieces of ore where chips are apt to fly. Among the devices which I have seen where no laboratory crushers are available, the ones sketched below can be procured almost anywhere, as all prospects have at least some apology for a blacksmith shop. Fig. 7 is one I saw used by W. H. Wiley, of Los Angeles, in Chihuahua in 1906. Fig. 8 represents a favorite Mexican device. Fig. 9 one I have used quite often. In cutting down the sample by quartering the truncated cone is very useful, as the material can be poured through this very easily, insuring a uniform spreading out of the material as the cone raised, with a minimum loss by dusting. For cutting down the smaller sample, a Jones sampler can easily be made out of kerosene cans, if one is not at hand. The one sketched in figures 11 and 12 shows the construction I have used for several.

Metallurgical sample.—Very few engineers seem to give much attention to this sample, but to me it is just as important as the mine valuation samples, for if you do not get accurate results on what you can get out of

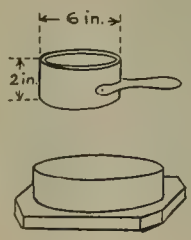

Fig. 7.

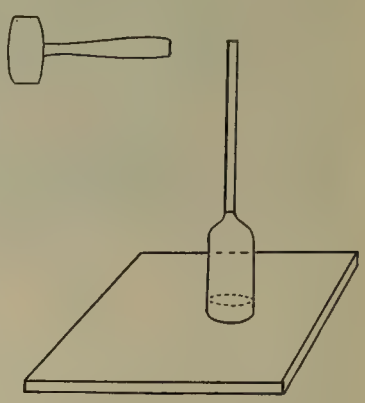

Fig. 8.

the ore, what is the use of knowing what is in the ore? Therefore, I recommend the following precautions:

1. Don't roast the sample in drying, as a roasted sample is useless for most metallurgical tests.

2. Don't crush the ore too fine in one operation, as the metallurgical sample should be taken as early as possible, especially when sulphides are present.

3. Don't cut clean ore samples and calculate the dilution afterward, especially where the walls are soft and decomposed; but cut waste along with the sample, if at

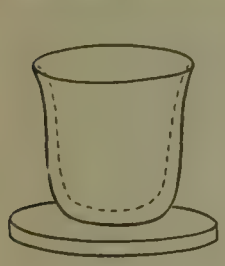

Fig. 9.

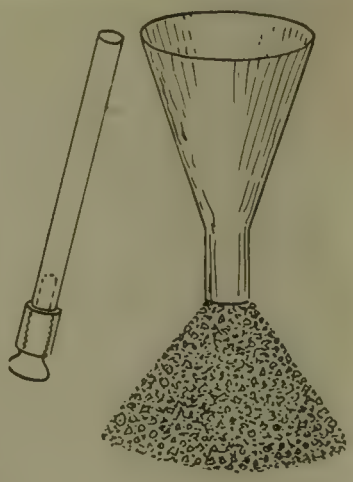

Fig. 10.

all possible, as this will have a vital bearing on the metallurgical test. The clean ore may be easy to treat by cyanidation, but the average ore may be difficult to treat, due to the colloids contained in the wall-rock.

4. Don't make up one composite sample from the entire mine, but keep the composite samples of different ore-shoots separate; also divide the ore-shoot into oxide and sulphide zones, making separate samples of these; for, whereas one part of an ore-shoot or one ore-shoot

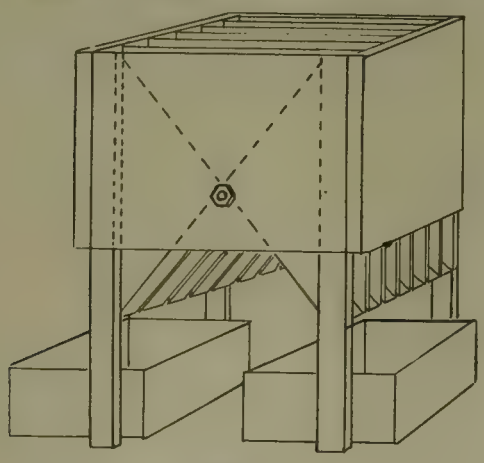

Fig. 11.

may be amenable to one method of treatment, the other may require entirely different treatment. Be sure to proportion each sample in your composite samples according to the tonnage it represents.

5. Don't place too much reliance on a high extraction obtained on some high-grade ore, as it is very deceptive; a poorer extraction usually results on lower grade ore.

6. Don't be afraid to take along a few pieces of high grade, some representative massive, or finely divided sulphides, or crystals; for by the aid of these the metallurgist may be able to identify minerals which are the source of difficulties in the metallurgical experiments.

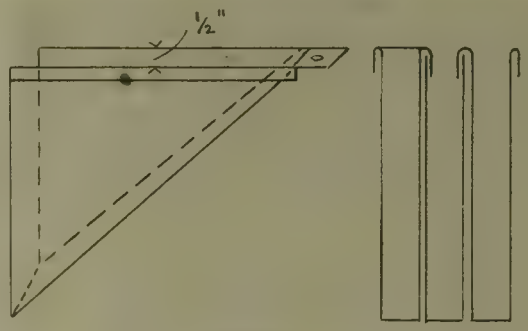

Fig. 12.

Likewise, representative pieces of wall-rock are at times invaluable.

7. Don't only cut a few check samples, but make up a few composite samples to check the assayer, as we are all human and none of us infallible.

The aggregate value of potash salts and fertilizer materials imported into the United States in 1914 was approximately $38,500,000, a decrease of $8,500,000. Imports were as follows in tons:

Material.	1913.	1914.
Kainit	465,900	329,600
Muriate of potash	213,800	168,500
Sulphate of potash	39,500	36,300
Manure salts	223,300	168,400
Nitrate of soda	625,900	543,700
Sulphate of ammonia	58,300	74,100
Bone dust and ash	34,600	36,000
Guano	19,100	25,600
*Apatite	3,000	100
*Calcium cyanamid	15,000	30,000
*Phosphates, crude	24,000	24,000
*Basic slag	15,000	10,000
*Other substances used as manure	115,000	197,000

*Fiscal year figures.

The year's purchases of the foregoing classification had an aggregate value of $37,117,000, as compared with $45,069,000 in 1913.

Crude acetic acid has been used up to the present time in the coagulation (thickening or setting) of rubber. An important discovery has been recently made in Ceylon by which cocoanut water will do this work as well and considerably cheaper. Large quantities of the liquid are available from cocoanut plantations. The water is allowed to ferment for four to five days, then one to two ounces of the liquid will coagulate one pint of pure latex (viscid, milky sap of the rubber tree). Ceylon exported rubber worth $22,000,000 in 1913, $5,089,167 going to the United States.

Gold production of New South Wales, Australia, in 1914 was 124,507 oz. fine, compared with 149,657 oz. in 1913.

Prospecting River Bars in Cold Countries

By THOMAS N. TURNER

It is sometimes desirable to investigate bars in river channels, either for their gold content or other qualities which the bar may have. The method for the examination of such bars, here described, is only applicable in cold climates.

Take for example a river channel of the cross-section shown in Fig. 1. Assume the river covered with ice to a depth of 4 ft., and a shaft 5 ft. in diameter to be sunk to the gravel bar 10 ft. below the surface of the

Fig. 1.

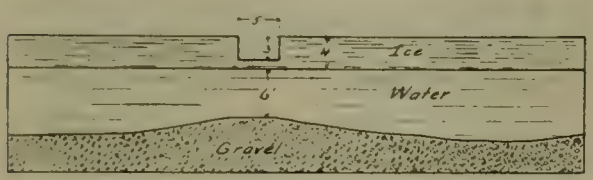

Fig. 2.

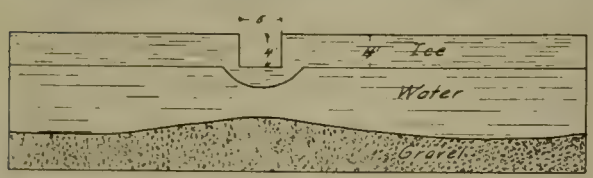

Fig. 3.

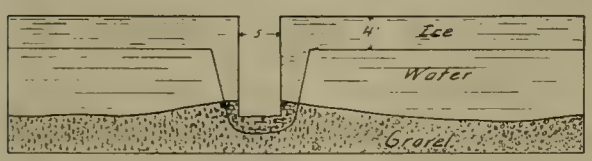

Fig. 4.

ice. Describe a 5-ft. circle on the ice over the point which you expect to prospect. Everything is now ready to start excavating. By the use of bars and picks the ice is removed, chipping carefully within the 5-ft. circle. Chipping and shoveling are continued until a depth of about three feet below the surface of the ice is reached. Great care must be taken so that the main body of the ice is not cracked, in which case the water would flood the shaft. At this point work is stopped to allow nature to do her part. The shaft is then as shown in Fig. 2.

After 24 hours' exposure to the cold air, work on the bottom of the shaft may be resumed. Perhaps under some conditions it would be best to resume work only after two or three days' freezing. Local conditions will determine the best time. However, chipping is again started and another foot of ice is removed from the bottom of the shaft (Fig. 3). These operations of freezing and chipping are continued until the shaft has been completed (Fig. 4).

In deep shafts it is sometimes necessary to set up an air-chute to send the cold air to the bottom of the shaft. This chute may be constructed of cloth or any other suitable material and of a type similar to the ventilators on a steamship. The positions of the shafts must be so arranged that the flow of water in the stream will not be impeded, for under such conditions the water pressure will break the walls of the shaft and flood the excavation.

The Sam Yet Prospecting Mill

By ALGERNON DEL MAR

On the Sam Yet mine, near Searchlight, Nevada, there lives an Anglo-Chinese who has mined in the western states for many years. The accompanying photograph

SAM YET AND HIS STAMP-MILL.

shows a one-stamp mill erected and used by Sam Yet. It will be noticed that the cam is made from a wagon wheel, the spokes being cut in the form of an involute shod with band iron. The tappet is an old cog-wheel, with others of miscellaneous character to add weight. The boss and shoe, not shown, are made from the plunger of a pump. The mortar-box is of wood, double-discharge pattern, with 40-mesh screens. The stamp is driven by a gasoline engine. Sam says the stamp weighs 500 lb., but I think it under this weight, and he claims 800 lb. of ore can be crushed per day and that he obtains from 80 to 90% extraction from his free-milling ore.

Increasing the Use of Steel Supports in Mines

By FRANK H. WAGNER

*Steel supports are now supplanting wooden timber in many mines, especially in places requiring strong permanent sets such as the foot of slopes and shafts, pump-rooms, main intakes and returns, and other similar places of a more or less permanent character.

The objections offered to the use of steel supports, however, are: (1) that it takes longer time and greater skill to handle and erect them; (2) the length of the legs cannot be readily or easily altered to fit the hitches, for the legs must be especially prepared to offer a firm foundation for the cement and base plate; (3) the feet of the struts and base plates, in wet localities, are subject to the corrosive action of mine water; (4) should a slight movement of the roof or bottom of the tunnel or gangway occur, the collar or legs of a steel set, because of their lack of resiliency, are often bent so as to necessitate their replacement; and this (5) is in itself another objectionable feature because it takes considerable time and skill, especially so if the bolts and nuts have been bent or corroded.

STEEL SUPPORTS WITH REMOVABLE WOODEN BUTTS.

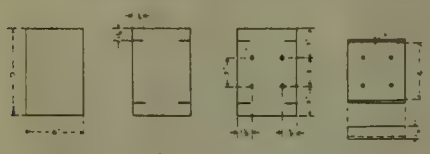

FIG. 1. STEPS IN MAKING BASE PLATES.

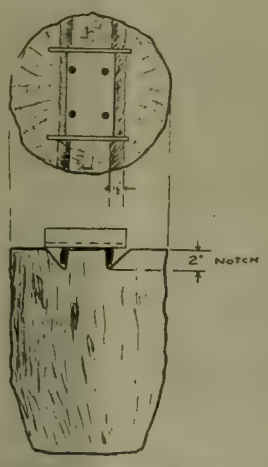

FIG. 2. WOODEN BUTT.

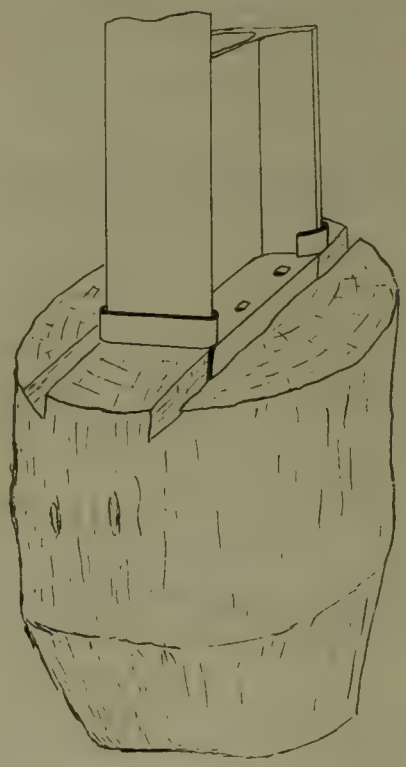

FIG. 3. WOODEN BUTT ATTACHED TO STEEL LEG.

To overcome all of the foregoing difficulties, the introduction of a wooden block or timber butt is suggested by J. M. Humphrey. These blocks or timber butts are found in plenty as waste in the timber yards, and could easily be shaped to take any hitch and be cut to any desired lengths, thus eliminating at once the inconvenience of a fixed leg length, or the cutting of steel, or making new hitches. These timber butts or blocks would also act somewhat as cushions for the steel legs, and under heavy pressure would crush or give way before the steel collar or legs would bend, and thus save the steel. The action of mine water along the bottom would be spent on the wooden butts and not on the iron base or foot of the steel legs. Wood will resist the corrosive action of mine water much better than iron or steel. However, even if the wooden butts do begin to corrode or rot, they could more easily be replaced than a base plate or a leg, and at less cost.

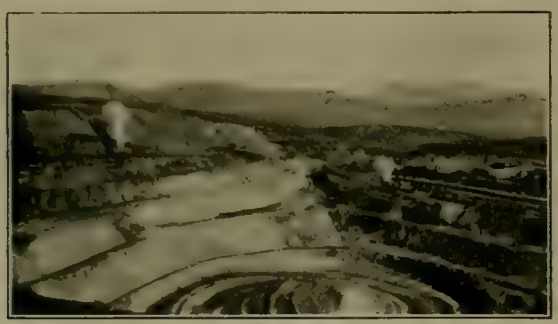
In renewing butts the collar can be jacked up, the old block knocked out, and a new one easily fitted and inserted. A piece of $1\frac{1}{4}$-in. flanged sheet steel could be used as a base plate to join the leg and block. The design of the plate is shown in Fig. 1, from which it can be seen that a 6-in. I-beam leg would take a standard plate of 6 by 9 in., as indicated by (a) Fig. 1. In (b), (c), and (d), Fig. 1, are shown the gradual steps in making the base plate, from stamping the four $\frac{1}{4}$-in. slots to drilling the spike holes and shaping the ends for holding together the blocks and leg. Fig. 2 shows the plates spiked or screwed to the butt ready to receive the end of the leg, and Fig. 3 shows the base plate flanges bent around the end of the leg to hold it firmly in position.

*Abstract from *Employes' Magazine* of the Lehigh Valley Coal Company.

A DEPOSIT OF CINNABAR is reported to have recently been found at Pulganbar, 30 miles from Grafton, New South Wales, and a plant of 20-ton capacity is being erected. The prospectors of the deposit are to apply for the government reward of £500 for the first 20 tons of cinnabar mined in the state. The deposit is said to be the most important in the British Empire, but the yield will show its value.

Safety Powder-Boxes

*In the bank blasting at the open-pit steam-shovel operations at Copper Flat the material moved, ore as well as waste, usually contains large boulders. Many of these are too large for the shovels or cars to handle, and have to be broken up by bull-dozing or 'dobe' blasting. To accomplish this it is necessary to have on hand at or near each shovel a small field supply, usually only one box or part of box, of Hercules dynamite, with necessary quantity of fuse and detonators. The question of the safe handling of this supply, and of safeguarding it in the field, has always been a serious one. In extensive operations, with several steam-shovels engaged at widely separated points, unless there is some definite point or place of storage at each machine, the field supply is likely to become scattered. Men get careless and



OPEN-CUT AT NEVADA CONSOLIDATED.

sometimes leave a stick or two of dynamite lying around, safely (?) tucked under a convenient rock, or in the open, here, there, and everywhere. The capman, that is, the cap and fuse magazine keeper, has charge of stock, and prepares fuse for use by crimping the detonators and making up all primer cartridges. It is also his duty to deliver fuse and primers to the blasters in the field. In the absence of any definite place or facility for field storage, the capman in making his daily deliveries is likely to leave his supply at any place 'nearby' or convenient, an extravagant and dangerous practice, to say the least.

To meet the demands of 'safety,' and to protect employees from the unnecessary dangers involved in the careless and haphazard manner of handling this field supply of explosives, a safety powder-box has been designed and is used. Two of these boxes, one for dynamite and the other for fuse and primers, are kept at each steam-shovel, at a safe distance from it, in charge of the blasters, but under the supervision of both powder and level foremen.

The box is constructed of 2-in. fir lumber, entirely covered with No. 24 galvanized sheet iron. The bottom is arranged to securely fasten a box, original package, of powder thereon, the remainder of the box, four sides and top, constituting the lid, which is hinged to the bottom. The box, painted a bright red, is easily seen from a distance, and is so constructed that there can never be any question as to whether or not it is closed, or left open so as to expose the contents. The fuse and cap box is of the same construction, with a box or tray divided into compartments in which are kept the fuse, caps, and primers.

The prime feature of safety of this box is that explosives are not exposed to the danger of ignition and possible explosion which might be caused by sparks and live cinders from passing locomotives, and from the steam-shovels and churn-drills operating in the immediate vicinity. Explosives are also protected from the possible danger of flying rocks from blasts.

Of equal value as a safety measure, perhaps, is this, that explosives are kept securely under cover at all times, protecting same from exposure to the sun on hot summer days, thus obviating the danger of possible leakage of nitroglycerine; and to a certain extent, preventing freezing in the cold winds of the winter months and the consequent risk and danger of handling frozen dynamite.

A secondary, though highly important, feature of safety lies in the fact that the use of these boxes tends to the culture of caution. They are a practical and ever present sermon on the text of 'safety first.' The inherent risks and dangers involved in handling explosives are kept constantly before miners, and the example set by the Company in thus making provision for safety against these hazards has a compelling influence on the thoughts of all employees. Order and system are evolved out of that chaos and carelessness which familiarity breeds with danger in the use and handling of explosives. This one feature alone is worth all the cost in money, time, and trouble in the use of the safety powder-box, leaving out of consideration the economy resulting in the saving of explosives which would otherwise, in careless distribution and lack of attention, be a waste and a loss.

*Abstract from *Safety First* of Nevada Consolidated Copper Company.

Kali Situation in 1914

*The turn-over of the German Kali Syndicate in 1914 amounted to approximately 156,000,000 marks, a decrease in comparison with 1913, when the amount of 192,000,000 marks was recorded.

In view of the fact that in July 1914 an increase of 11,000,000 in comparison with other years was noted, an annual turn-over of 210,000,000 marks would probably have resulted but for the war.

From the foregoing it can be concluded that the loss on account of the war can be figured at 50,000,000 marks. In consequence, the overhead charges in the operation of the works has risen considerably, to which fact should be added the increase in price of raw materials and the difficulty in obtaining proper help. The war has retarded the negotiations in regard to prolongation of the Syndicate, and at a meeting in the near future, steps will be taken in this direction.

*From the *Weekly Report*, January 30, 1915, published by the American Association of Commerce and Trade, Berlin.

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

Molybdenum

The Editor:

Sir—Apropos to the editorial in the *Press* of February 6, I wish to call your attention to the one commercial valuable molybdenum mine of New Mexico. It has received little publicity, but, according to its owner, has had an ever ready market in Philadelphia and New York at $1.50 per pound. I have not had an opportunity to examine this mine nor investigate the ore treatment process through which the ore is said to be successfully separated, but am in the possession of whatever information is given out by the owner and also have received excellent samples of the concentrated molybdenite.

The properties are owned by Margarito Romero and are in the El Porvenir Mountain mining district, 16 miles northeast of Las Vegas, San Miguel county and eight miles from the A. T. & S. F. railroad. In the group are 16 claims with shafts in various places disclosing ore in place. A hundred-foot shaft has been sunk on a commercially valuable vein containing molybdenite, tungsten, copper, and silver. An 800-ft. adit has just been completed, and the main vein of the property has been reached. A concentrating mill is situated one and a half miles from the portal of the main tunnel.

A successful method of treating the ore has been invented and put into practical use, but only after a long period of unsuccessful trials with oil and electrical concentration. According to Margarito Romero, the inventor, the process is as follows: The ore is crushed on a flat mortar, after which it is roasted and screened through 20, 30, 40, 50, and 60-mesh screens, the tailing being treated in a flume of running water. Sizing seems to be the key to the separation, after which water currents carry off the oxidized copper. Owing to pending patent applications, Mr. Romero would not make the minor details of the process public. Copper, the interfering element, is cleanly separated from the ore, leaving a product assaying 70 to 90% pure. Mr. Romero advises me that he receives on an average of $1.50 per pound for the pure molybdenite f.o.b. New York city.

FARIS V. BUSH.

Lordsburg, New Mexico, February 13.

[Removing the copper is one of the difficulties that has stood in the way of concentrating molybdenum. In our editorial of February 6 we mentioned a method based upon surface oxidation of the copper sulphides prior to flotation and ascribed the idea to James Aston. The method is in fact in commercial use at the works of Henry E. Woods of Denver, who worked it out independently. Mr. Woods treats the concentrate by flotation, using the surface-tension method and ingenious machinery invented by him, and described in the *Trans.* Amer. Inst. Min. Eng., Vol. XLIV, pp. 684-701. There is a good market now for molybdenum, and if a steady supply could be assured the metal would find many new uses.—EDITOR.]

Patents and Metallurgists

The Editor:

Sir—After a careful reading of your recent issues of the *Press*, I am sure your metallurgical subscribers must be mentally divided into two divisions, one of which finds its expression in saying: "Go it, boys! By the time we get a few more 'Near to Dorr' classifiers and thickeners, 'Near to Trent' agitators and replacers, and 'Near to Merrill and Kelly' filters, we will have the old standard devices with their outrageous prices knocked into a cocked hat." The other division finds its expression in saying: "How many more poor designers are going to inflict financial loss, grief, and legal troubles upon unsuspecting companies? Why don't they change the patent laws to protect the men who have labored long to develop a standard machine?"

The metallurgists in the first division will say: "Look at this unit in my mill. It consists of a combined steel shafting and simple castings and was billed at a price that equals 16c. per lb. for the metal. I can stand all the expense of new patterns and turn it out here locally for one-half the money. Here is one of pipe and castings that was billed at a price equaling 25c. per lb., and I can build it for a third of that. The margin of profit is outrageous! Here is an unpatented article, the tube-mill, requiring very large and costly manufacturing units to produce it, yet its cost was only 4c. per lb. Here is a ten-stamp battery with its many units with only a cost of 4c. per pound!"

However, the metallurgist of this class usually pays the price of the patented devices, knowing full well that the performance of these particular units will add to his own reputation as a designer and operator and pay back their higher cost to his company in savings made. Later, when he goes to order renewal parts and finds that he is still paying a price that includes patent rights and original selling costs, he patronizes his nearest foundry. Other more venturesome and usually less experienced metallurgists, or others more skilled in patent office lore than practical mill experience, design new and 'wonderfully efficient' machines much exploited by local papers that soon find their proper place 'behind

the mill or in the courts alongside the model and earlier patent papers of their parent machine. Instances of this kind are common among metallurgists, but not so among the college students. The technical press continues to herald the birth notices with loud acclaim, but fails to publish the dismal obituaries, for the reason that the authors of the first never supply the latter and the kindly metallurgical fraternity hold silently to their medical brothers' oath of Hippocrates.

The metallurgists of the first division can argue in self defense that even accepted standard mill units are not free from patent troubles to the user. It is no wonder the metallurgist hesitates before adopting any unit when it is common knowledge that many large companies paid four times the manufacturing costs of certain patented articles, to be faced years later with the proposition of defending themselves from out of their own treasuries or paying a second bonus to a previous process patent.

The metallurgists of the second division appreciate not only the spark of genius that planted in the mind of the inventor the conceptions of the principles of a new machine or process, but also the wiser ones can picture the long days of designing and building, the part failures, reconstruction, and improvement, with their cost in persistent concentrated effort and hard cash. After the advent of the Dorr thickener, many a metallurgist indignantly said, "That is too simple to even deserve a patent." A few months before he would have said, if such a wonderful automatic labor-saving idea had entered his 'made to order' brain cells, "Moving arms in a settling pulp—impossible!"

The careful thinker will realize that the greatest cost to a patentee, along with constantly improving and developing his machine, is that of convincing his fellow-metallurgists of its worth and securing his orders. At last when a patentee has about emerged from his trials into financial success and believes himself a benefactor to his profession, he must get a hard jolt when a half dozen close imitations of his patent spring up, most of them representing discarded steps or ideas of his own or a design that follows the principles but escapes the wording of his patent.

My acquaintance has brought me in contact with those who would alter or adopt at financial loss any unit in the plant that would dodge a commonly accepted valid patent, and with those who would patent the proverbial left-hand monkey-wrench and cry to the heavens from a house-top against wilful infringers. A common-sense discussion of this subject could never shake the rooted convictions of the above extremes, but it would at least give the younger members of the profession a fair perspective of the subject before later circumstances tend to throw them into one division or the other.

JAY A. CARPENTER.

Tonopah, Nevada, February 7.

[Pirating patents is an all too common matter, due in large part, as we believe Mr. Carpenter truly points out, to the failure of buyers of patent machinery to realize the cost not only of manufacturing but of perfecting, popularizing, and selling even the best devices. Another important factor is the admitted imperfections of our patent laws and patent system. When so many invalid patents are issued by the government, it is no wonder that the ordinary layman comes frequently to the conclusion that it is not only possible but proper to compel a patentee to establish his right to royalty, or high selling price, in the courts. The result is a situation that is little short of disgraceful, but one in which, it must be said in fairness, miners and metallurgists are not alone involved. We doubt if there will be any substantial change until the patent laws themselves are changed. If only valid patents were issued, both patentee and public would be protected against the enormous cost of the present system of trial by lawsuit. Probably Mr. Carpenter is right that mere argument will have little effect upon those who have already committed themselves on this question, and that it is the young men entering the profession who should be asked to consider the situation before they line up with either party. To these men we suggest that the field is one calling for the application of the good old rule that miners ought especially to honor since it is called golden. —EDITOR.]

IN the *Transactions* of the A. I. M. E. for February, 'The Mining and Reduction of Quicksilver Ore at the Oceanic Mine, Cambria, California,' is the title of a paper read by C. A. Heberlein, of Los Angeles. Operations at this property date from 1876, when rich 'sand' ore was discovered. Up to two years ago various attempts had been made by the Oceanic Quicksilver Co. to mine the more refractory 'mud rock,' which was encountered lying beyond the 'sand rock.' Mud and sand rock in varying quantities were treated together with poor results, but operations were successful with sand rock of fair percentage. About two years ago, when all the sand rock had been exhausted, Murray Innes purchased the Oceanic mine. He found large quantities of low-grade mud rock, varying from 6 to 8 lb. of quicksilver per ton, which at the prevailing low price of quicksilver demanded very cheap mining costs, in conjunction with high but cheap metallurgical extraction. At that time the extraction of quicksilver from mud rock ranged between 40 and 50%. The method of mining is as follows: The whole orebody between two main levels 100 ft. vertically apart, for a longitudinal distance of 300 or 400 ft., is attacked by two raises, which are connected by intermediate levels 25 ft. apart. Long holes are drilled with hammer drills from below and above on one end of the slice and shot. The slicing proceeds from one end of the block, and the ore is trammed to the other raise. Shooting from above and below at the same time, the intervening slice is completely broken up. What broken ore falls into the drifts is dumped into the chute; most of the ore is handled from the level below. The cost of driving in the mud rock with hammer drills ranges from $1 to $2 per foot; and mining the ore costs $1 to $2 per ton.

CONCENTRATES

Readers of the MINING PRESS *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

ALKALI is a term applicable to any substance having well defined basic properties. A base is a compound capable of combining with an acid to form a salt, plus water.

ABSORPTION infers chemical or cohesive action. Thus a block of charcoal may be said to absorb gases, but as a matter of fact the gases are *adsorbed* on the surfaces of the carbon particles.

WORKING COSTS at Mt. Morgan, Queensland, totaled $11.35 per ton, during the last half-year, compared with $14.44 in the previous term. These included development and realization charges.

ONE OF THE GREATEST DETRIMENTS to the more complete realization of the thermal values of fuel in boiler-furnace practice is the impairment of efficiency due to the excess air which is permitted to pass through the furnace in such enormous quantities, according to D. F. Nisbet. The losses from this source may absorb, of the heat value of the fuel, anywhere from 8%, with a 10% excess of air; to 30%, with a 200% excess, and 200% excess is not infrequently encountered in practice.

MILL OR CYANIDE SUPERINTENDENTS are seldom responsible for the design of the plant over which they have control, but they are responsible for a rise or decline in costs. They should be afforded every opportunity for explanation in the one case and should have due credit in the other. For this reason, they should be thoroughly conversant with all expenses incurred and should be periodically furnished with statements of working costs in those instances where they are unable, from lack of data, to compile these for themselves.

A SINGLE SUGAR PINE TREE which was cut in trespass in the Stanislaus national forest, California, yielded more than enough actual lumber to build a good sized suburban house, and in settlement the government has received $99.40. The tree scaled 18,933 board feet, and was valued at $5.25 per 1000 ft. Not many trees contain enough lumber to build a two-foot board walk nearly two miles long, and this is believed to be the first case on record in which a single tree felled in a national forest was valued at almost $100 on the stump, although national forest timber is frequently sold at considerably higher rates.

REVISION of the United States mining law is needed chiefly because of the following reasons, according to Courtenay De Kalb, in the *Transactions* of the A. I. M. E.: (1) the conceptions as to the characteristics of orebodies that were held at the time the statute of 1872 was enacted have since proved to be in many respects erroneous (especially the 'law of the apex'); (2) the operation of the existing law has been found to work unnecessary hardship on many claimants to mineral land; (3) the existing statute fails in large degree to encourage development of mineral resources; (4) the existing law often produces conflict between placer and lode-claim rights, working unnecessary injustice to placer claimants; and (5) the methods of establishing the rights of locators on United States mineral lands are defective, and are not uniform throughout the states within which such lands exist.

NICKEL-PLATING ALUMINUM is practicable, according to M. Le Chatelier, who has made a communication to the Académie des Sciences, stating he has succeeded in nickel-plating aluminum, which has not been accomplished by the ordinary methods. This has prevented the extensive employment of the metal on account of its dull appearance. This difficulty has been surmounted by a preliminary scouring of the aluminum in a bath of hydrochloric acid containing a certain proportion of iron. The iron precipitated on the surface of the aluminum forms a kind of network, and when the metal is passed into a nickel bath the nickel gets entangled in this network and adheres strongly to the aluminum. This process, which is based on a physical action, appears to solve the problem which had hitherto been considered insoluble.

A FACTOR IN GOOD WIRE ROPE SERVICE of equal importance to the selection of the right quality and construction of rope, is the correct handling of the rope, both before and during its use. One very common cause of wire rope trouble is kinking, with the invariable result of shortened service, if not a sudden breakage; however, this can be readily prevented by exercising due care in handling a rope. Another important factor is correct lubrication. A wire rope needs lubrication the same as any piece of machinery, for there is constant friction between the outer wires and the sheaves, drums, etc., as well as friction between the inside wires and strands rubbing against one another. Moreover, the right kind of lubricant will prevent internal and external corrosion. It is essential that care be used in the selection of a lubricant, as some so-called lubricating substances contain elements that cause a chemical action upon the steel, and their use is an actual detriment. If a rope is not to be placed immediately into service when received, it should be stored away in a place protected from the weather and any acid fumes.

MINING IN THE FAR NORTH*

Hot Springs, Gold Mountain, Koyukuk, and Andreafski Districts

By EMIL EDWARD HURJA

Hot Springs District

The first mining in the Hot Springs district was done in 1908, after a stampede following the first discovery of gold there in 1907. Hundreds of miners flocked to the diggings, and the gold-bearing gravel area was roughly demonstrated to be 25 miles long and from 5 to 10 miles wide. The first finds were on Sullivan creek, but later gold was found on neighboring streams, a part of the lower Tanana watershed. Since then mining has been carried on successfully each year.

The 1914 output of the Hot Springs district of the Tanana will exceed that of any previous year, according to prediction of mining men. The season's clean-ups should total in excess of $1,000,000, because of the great amount of gold being taken from the new Bock discoveries on lower Sullivan creek near the mouth of Woodchopper.

Adolph Bock, after several years of prospecting and the expenditure of $70,000, found 'pay' on Hokeley gulch, a tributary of Woodchopper creek, which runs into Sullivan creek on the left limit about three miles below the town of Tofty. The find was made on the Wild Goose claim, and immediately preparations were made to mine the ground on an extensive scale. During the past summer he expected to work out from 40,000 to 50,000 ft. of bedrock. The depth of the ground is 130 ft. Most of the gold is found on bedrock. The gold is mixed and shows great range in both fineness and wear. Work is being carried on from two shafts 200 ft. apart. One plant furnishes power. Three 50-hp. boilers are being used. Fifty men are employed. The ground averages from $3 to $6 per sq. ft. and the weekly clean-ups amount to $20,000. Water for sluicing is obtained from a lake one-quarter mile distant. After using, the water is returned to the sluice-boxes from the sump and re-used. The sluice-boxes are 150 ft. long. Pole and Hungarian riffles are used. Difficulty in saving gold is experienced because of the presence of clay.

BUCKET DUMPING ON SULLIVAN CREEK, MANLEY-HOT SPRINGS DISTRICT.

Sylvester Howell and Jenny Cleveland are operating on Miller gulch, a left-limit tributary of Sullivan creek four miles from Tofty. The ground averages from 80 to 120 ft. in depth. Gold is found mostly on bedrock, although in places it is scattered through a good quantity of gravel. Three plants are working on the claim, and a Keystone drill is being used to find additional 'pay.' Another year of work is in sight. Seventy men are being employed. The 'pay' averages $3 per sq. ft.——William Stewart is working on Miller gulch on the same spot of 'pay' that Howell & Cleveland are mining. He employs 25 men. Jack McKenzie employs 12 men at his plant farther upstream. The ground is from 45 to 60 ft. deep. Water for sluicing is obtained by pumping.——Dick Richards has a small outfit at work on Cache creek, and is reported to be taking out good 'pay.'——Kemper & McVicar finished working out their block of 'pay' on Discovery claim early in the spring, and since that time the claim has been idle.——The Koebsch outfit on the Midnight Sun claim, situated on the left limit of Sullivan creek one-quarter mile above the town of Tofty, is working in wet ground. Their shaft was put down in a small block of frozen ground and drifts run into the pay-dirt. This winter it will be necessary to pump water in order to keep the drifts clear.

American creek is a tributary of Fish lake, is 10 miles long, and has been worked since 1910. In 1911 the output was $4000; in 1912, $85,000; in 1913, $60,000; and in 1914 probably will be $60,000. William Brown and George Heldman are working with two men on the Chicago claim. The ground is 18 ft. deep. Nine men are employed on the Tanana claim by D. G. Hostler, layman. The ground is owned by Mike Murray. Above the Tanana claim, Ed. Ness is working a 'lay' on the Hill claim, using a 40-hp. boiler and employing 10 men. Hastings, Kinnalley, Spencer & Quinn are working on the Sourdough claim, using a 12-hp. boiler. Lockhead & Kinnalley are working on the Nebraska claim, about a quarter of a mile below Discovery claim. They have only a windlass outfit, but expect to increase their plant soon.

On Thanksgiving creek, Frank Stevens has a small crew of 10 men at work, while several other outfits are ground-sluicing. On Eureka, Johnson & McCormick employ eight men and operate a Bagley scraper. Frank & Graham operate a small hydraulic plant on Seattle Junior creek, a tributary of Pioneer. On Gold Run creek, also tributary to Pioneer,

*[Previous articles in this series by Mr. Hurja on mining in Alaska and the Yukon have been 'Mining Revival in the Ketchikan District, Alaska,' July 4; 'Wrangell, Alaska,' special correspondence, July 11; 'Developments of the Alaska Gold Mines Co.,' July 18; 'Juneau, Alaska,' special correspondence, July 25; 'Cordova, Alaska,' special correspondence, August 8; 'Valdez and Prince William Sound,' August 15; 'Seward and the Kenai Peninsula,' August 29; 'The Koyukuk Mining District,' September 12; 'Operations of the Yukon Gold Co.,' October 10; 'Skagway-White Horse Mining District,' October 17; 'Operations of the Canadian-Klondyke G. M. Co., November 14; 'The Klondike, the Treadgold Placers, and Outlying Districts,' November 28; 'The Upper Yukon: Circle City, Eagle, and Woodchopper,' December 5; 'Placer Mining in the Fairbanks District,' December 19 and January 2; 'The Outlook for Quartz Mining in the Fairbanks District,' January 16; 'The Iditarod District—Dredging and Placer Operations,' January 30; 'Ruby District: Prospecting, Gravel Washing, and Gold Production,' February 13.—EDITOR.]

Lane & Stevens operate a small plant and employ six men. An outfit of Bulgarians on the same creek employs seven men.

The tin production of the Hot Springs district promises to be more this year. Stream tin or cassiterite has been found in the sediments of the district in great abundance, and some of the operators are now making a point to save the tin ore from their sluice-boxes. One outfit in particular, Cleveland & Howell, are saving it with a subsidiary string of sluice-boxes connected to the main string by a gate. Every few hours, when the riffles of the main string have become clogged with the tin ore, the connecting gate is lifted and the water turned in to wash the accumulated cassiterite into the subsidiary box, from which it is sacked for shipment. They have gathered already a total of 32 tons and expect to make a shipment soon. The tin production of the district in 1912 was 20 tons; in 1913, 14 tons; and so far in 1914, 15 tons has been shipped.

The Gold Mountain District

The Gold Mountain, or Gold Hill district as it is sometimes called, is situated from 20 to 40 miles below Tanana, on the right limit of the Yukon. It embraces the watersheds of several small streams which enter the Yukon from the north. The principal stream is Grant creek, which has been the objective of several small stampedes during the past seven years.

Gold was first found there in 1907, and the stampede that followed resulted in the staking of all the ground in the form of association claims of 180 acres each. This tied up mining development effectually. The Gold Mountain district embraces some 600 square miles of territory. The mountains of the district have an average altitude of 3000 ft. above sea-level. The Yukon has an elevation of 300 ft. above sea-level in the Gold Mountain district. Probably the first lode mining in Alaska was attempted at a locality known as Gold Hill. A 110-ft. adit has been driven on a two-foot lode of broken quartz. Placer prospecting has been confined largely to the stream beds, but because of the abundance of water in the gravels; difficulty has been encountered in working the deposits so far discovered.

Gaudette & LeManager are the only mining men who spent the past summer in operations in the Gold Mountain district. They own a group of claims on Grant creek. The 'pay' is from 10 to 14 ft. deep. It averages $1.25 to the square foot of bedrock. Grant creek was the subject of an investigation by dredging engineers several years ago. Nothing definite has been done since that time, however. The most recent stampede to the district occurred in 1911, when an army cook returned to Fort Gibbon (Tanana) with specimens of coarse gold taken from the Grant Creek gravels.

Red Mountain (Koyukuk) District

The output for 1914 from the Red Mountain district in the Koyukuk watershed is estimated at from $75,000 to $80,000. Between five and eight outfits have been at work fairly continuously all summer. Water conditions have been excellent and operations are said to have been very satisfactory. Jack Felix is operating on Indian creek, as are O'Brien & Swanson, and Tate & Marsan. The ground is from five to six feet in depth. Wood costs from $8 to $9 per cord, so that working costs are fairly high. The Indian River district was discovered during the summer of 1910 by Felix and associates, who went up Indian creek from its confluence with the Koyukuk and found gold at the mouth of a small gulch which was named Felix gulch. A small stampede to the district that summer and the following year ensued. The supply point of the district in summer is Hughes, 40 miles distant, at the mouth of Indian creek; and, in winter, Tanana, about 150 miles by trail.

TANANA, ALASKA; WATERFRONT AND MAIN STREET.

Andreafski Gold Fields

The Andreafski gold district is one of those in which the most recent successful search has been made for gold. The district is situated 244 miles upstream from the mouth of the Yukon river on the north bank. A. C. Rohde, a prospector from Nome and other parts of Alaska, for three years since 1910 had known of the existence of a mineral-bearing zone in the section of the Yukon lying about 100 miles due inland from St. Michael. He induced Andrew Edgar, also a Nome man, to go prospecting in the section, and they accordingly set out from St. Michael. They mushed to the head of the Atchulunuk river, there built a boat and floated down to the Yukon river. They poled up the Yukon to Wilson creek, a stream which they named. In August 1913 they found rim prospects on Disappointment creek, getting 10c. to the pan. A stampede followed, and 250 men came to the district before the close of navigation.

No real mining work was done on any of the streams comprising the district until the spring of 1914. There are 25 men in the district now, engaged in active mining. The first gold, $8000, was taken to St. Michael for shipment to the United States mint by Frank H. Waskey, United States commissioner, late in August of 1914.

A. C. Rohde expects to take out $3500 this season on No. 1 Disappointment creek. He is employing six men. The ground is from three to nine feet in depth, of which 20 in. is 'muck.' 'Pay' lies immediately above and on bedrock.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

LORDSBURG, NEW MEXICO

NEW RAILWAY INTO LORDSBURG.—S5. BONNIE, SILVER GLANCE, CHINO, MEMPHIS, BUFFALO-NEW MEXICO MINING COMPANIES' OPERATIONS, AND NEW MINES.

A branch line of the Arizona & New Mexico railroad may be built from the ore-loading station south of Lordsburg, known as 'oil siding,' to the mines in the Shakespear and Virginia districts, according to a note of that Company filed with the State Corporation Commission at Santa Fe. Shipments average 150 cars per month, consigned to the El Paso and Douglas smelters. Construction of the spur has been under consideration by both the A. & N. M. and Southern Pacific lines, and the filing of intention may only be precautionary measures. It is also reported that the construction of a narrow-gage line from Duncan, Arizona, to the Utter mines at Steeple Rock, New Mexico, is under consideration by capitalists.

The 85 mine, in the Lordsburg district, is employing over 200 men, and is the second largest producing copper mine in the state.——The Bonnie Mining Co. has all machinery in place, and is sinking the new shaft at the rate of five feet per day, at the same time continuing work on No. 1 shaft and shipping occasionally. One of the richest veins in the district was discovered about 20 ft. from the surface during the initial work on the new shaft. It is five feet wide and should average $35 per ton in copper, gold, and silver. The vein will be fully developed when the new shaft is down 500 ft.——It is reported that California people having interests here have commenced sampling and experimenting on ore near the Atwood mine, with the object of erecting a reduction plant in the district if the tests are successful.

Incorporation papers have been filed at Santa Fe by the Silver Glance Mining & Developing Co., of Silver City. The capitalization is given at $25,000, and the object is to develop and operate claims in the vicinity of Cliff. Baylor Polk and Barnes and Royall of Silver City are the incorporators.

A lease has been taken on the McDaniel mines at Cook's Peak, Luna county, by A. O. Ihlseng, and a few men are preparing the property for shipping. A large number of miners will start work in the region early in March.

In Sierra county, a large amount of development is under way in the Hillsboro and Kingston districts.——A contract has been let for 350 ft. of driving in the Eureka mine, by F. W. Moffett.——The Fox property is being put into a workable condition by John Sears of the Placers.——P. H. D. Bendixen is another who is opening good ore.——Prospects throughout the area are encouraging.

The Chino Copper Co. is installing a turbine engine in its power plant at Hurley, Grant county, which will produce more power for the mill and mines at Santa Rita.

THREE PEAKS OR BIG BURROS IN BACKGROUND. HILLS IN FOREGROUND SCENE OF MINING.

PORTAL WAY AND HAULAGE ADIT, BURRO MOUNTAIN COPPER CO., TYRONE.

The Memphis Mining Co., in the Organ district of Dona Ana county, held its annual meeting and election of officers last week, and plans were made to do general development work in addition to the two leases at both ends of the property. J. I. McCulloch, president of the Company, has secured an option on the Torpedo mine, which has been the subject of litigation for many years.

The Buffalo-New Mexico Mines Co., at Red River, Taos county, has received a carload of mining machinery, which will be removed to the property and development started. The shaft is now down 150 ft., and will be extended 250 ft. deeper.

Reports from the Pecos Valley oilfield are to the effect that several new companies are entering the region, and a large acreage is being taken up for test drilling.

The Santa Fe Gold & Copper Mining Co., at San Pedro, is to begin new financing through the issuance of $250,000 7% convertible first mortgage real estate bonds, to be offered the stockholders at $95. A number of new companies have been formed in this state lately, indicating revived interest in mining.

NEW YORK

ANACONDA FINANCIAL AFFAIRS, AND AMALGAMATED.—SOME OPTIMISTIC NOTES ON COPPER.—SPELTER.—AMERICAN ZINC, LEAD & SMELTING CO.—LAKE COPPER NOTES.—DIVIDENDS.

Another wheel within wheel has been added to the already complicated financial mechanism of the Amalgamated, Anaconda, United Metals Selling, and International Smelting & Refining organization. Four years ago, the Amalgamated Copper Co. made an issue of $12,500,000 5% notes, which matured on March 15, 1913. These were refunded in 1913 and extended to March of the current year. The proceeds of this note issue were used to purchase the United Metals Selling Co. Now a further step is taken toward making the Anaconda the great holding as well as operating company of this group. The National City Bank and the Guaranty Trust Company of New York have just sold $16,000,000 of two-year 5% notes of the Anaconda company at 99¾. The cash derived from this sale is to be used to purchase the United Metals Selling Co. from the Amalgamated, which latter Company will in turn retire its own notes of $12,500,000, maturing March 15 next. Anaconda now owns every agency connected with its own operation, controlling all details from the ore deposit to the point of delivery of refined copper to the customer, while 'Copper,' as the Eastern markets designate Amalgamated, is now left with its holding in Anaconda as its chief asset. While there is nothing to justify a prediction that Amalgamated is eventually to disappear as an entity in the copper world, yet the fact cannot be ignored that all of the recent moves made in the formation and enlargement of the new Anaconda have resulted in the taking away little by little, or rather 'much by much,' of the importance of Amalgamated except as a stock-market leader. It has been said that there are those who would be glad to see 'Copper' pass into history, and while such may or may not be the intention, the way for such a move is being opened. The money raised at this time for the Anaconda, in excess of that required for the shift of the ownership of the United Metals Selling Co. is to be expended in betterments and improvements. This matter is dealt with editorially in this issue.

There could never have been a better demonstration of the strength of the position of the copper producers than the current market. The metal has been marked up to 15c., in spite of curtailed production, which is a state of affairs so infinitely better than that of having a surplus production pile up to drag prices down, that everyone must applaud, and most of all, those who would make the most of the country's natural resources. It is a popular belief that every man 'cusses his own trade;' probably the belief is justified, but certainly one of the exceptions that proves the rule is to be found among the copper producers. Their faith in the future of the industry, in the world's need for copper, seems boundless. It was once the fashion to point to the so-called 'porphyries' as about to pour out such streams of copper as would allow the user to fix the price for all time to come—all of which is now much changed. No one disputes the position of the producer, and they are still bending every energy toward increase of output, not momentarily, to be sure, but for the future. One of the interesting figures in copperdom, who has made history in this direction, Don Marco Chiapponi, is now in New York. It was Mr. Chiapponi who made the first examinations of the Braden, and later sold it to the original group of owners, who expected to develop it as a high-grade property. Mr. Chiapponi also had a great deal to do with the early development of the Chuquicamata. His life work all over the world in mining has but served to solidify his faith in copper. Commenting on the possibilities latent in the treatment of oxidized ores containing copper not now recoverable, Mr. Chiapponi brushed aside the old bugaboo of too much production as nonsense. The world will need all the copper that can be turned out, and the next decade will see production at figures that will make the highest records now standing seem small enough, is his prediction. The efforts that are being made everywhere to work out successful leaching processes are, of course, in a way, proof of his assertion. Mr. Chiapponi has had some interesting experiences in his explorations of the *antiguas* of South America. One of these was the discovery in the Chuquicamata of the body of a native child, who had been imprisoned by a cave-in centuries before. The body in perfect outline, a little basket in one hand, had been transformed into a stalagmite. It was removed from the mine, exhibited in all the principal museums of South America, and as a final resting place is now in the Museum of Natural History in New York. It is said the face assumes a scornful expression when anyone in hearing distance sings or whistles "It's a long way, etc., etc." Natural enough, to be sure, but hardly to be credited.

The ruling price difference between Lake and electrolytic copper, at one time almost eliminated, has returned to the market. Owing to the greater ease with which Lake can be drawn in making shells, buyers working on ordnance contracts are discriminating in its favor.

The spelter situation is claiming nearly as much attention as copper. It has long been somewhat a matter of mystery to the layman that the domestic output of zinc seemed to have so precarious a footing. The turmoil in Europe has shed light on many trade conditions, this being one. The smelters on the Continent, no longer taking the Australian output, heretofore handled under long-time contracts, cannot now make an import price that rules the market. Consequently there exists a 9½c. spelter market, and an opportunity is created for some such market stabilization as has been accomplished in copper. Spot supplies have all been taken up and a bid of 9½c. for 1000 tons failed to find a taker. As spelter is absolutely necessary to the brass manufacturers, who are now all working overtime, where they can get orders for cartridges and shells, there is a prospect for some interesting developments in the spelter market. If the war works a cancellation of the German contracts with the English-controlled zinc mines, there is something more than a possibility that the industry in this country can win its way to a permanently better basis. Germany has placed an embargo on all shipments, even to friendly nations, except by special government permission; her production is far below normal rate.

The American Zinc, Lead & Smelting Co. is extending operations as fast as the somewhat hysterical market conditions will permit. The production from its Mascot property in Tennessee, which is a high-grade spelter, commanding a premium in the trade, is to be increased from 1200 to 1800 tons per day. Operations in Missouri and Wisconsin are also being speeded up, and the Kansas smelters are doing a greatly increased business in custom ores.

The United States Smelting Co. is said to have curtailed some of its development work on the Ebner at Juneau, Alaska, war-time conditions making retrenchment temporarily necessary.

The Calumet & Hecla is making a large shipment of silver to the Philadelphia mint this week; the first being made in January. The Quincy is also making a shipment to Philadelphia. There is some expectation that the White Pine property of the Calumet & Hecla, which will begin mining and milling operations in April, will produce some gold and platinum, drilling operations on the Nonesuch lode, in Ontanagon county, having shown cores with appreciable quantities of both metals. A description of this property will be published in a future issue of the *Press*.

Dividends have been declared by the following companies, payable March 31: Butte & Superior, 75c.; Chino, 75c.; Nevada Consolidated, 25c.; and Utah Copper, 75c. per share. That of the Ray Consolidated was deferred. Quincy has increased its distribution to $1 per share.

WASHINGTON, D. C.

Experiment Stations and Rescue-Car Bill—Leasing, Radium and Mining Law Bills. Timber Cutting. Regulation—The Oil-Land Withdrawal Decision.

The only legislation on mining that had a chance in the closing days of Congress was the Foster bill to create 15 mining experiment stations and establish new rescue-cars, and on this bill the mining people concentrated their efforts. The bill had already passed the House, and the Senate committee agreed to report it to the Senate at once, with the recommendation that it pass, and to suggest amendments only in the event that they could be added and yet the bill pass in time. The mining men of the Senate wanted the number of rescue-cars increased by seven instead of by two as arranged in the House bill, making the total 20, but the attempt was not to be made at the risk of imperilling the enactment of the bill. The U. S. Bureau of Mines recently published the assignment of personnel of mine rescue-cars and stations in the country. They are scattered through Alabama, California, Colorado, Indiana, Illinois, Kansas, Michigan, Montana, Oklahoma, Tennessee, Pennsylvania, Washington, and West Virginia.

It was early concluded that the leasing bill was dead and also the radium bill, on both of which measures there has been much debate and many hours of hearings, and all for naught. Even the bill which had already passed the Senate for the creation of a commission to codify the country's mining laws, was given up in the House by Congressman Foster, chairman of the mines and mining committee. There was not any enthusiasm on the House side for this commission.

A bill reported favorably in the Senate, and on which action may be expected in the session of Congress, relates to cutting timber for mining purposes by corporations organized in one state and conducting mining operations in another. The legislation embodied in the bill more specifically permits mining companies, when organized in one state but doing business out of the state, to cut timber standing on its mining property for use in the development and prosecution of mining operations. The measure has been approved by the Department of the Interior, A. A. Jones, the first assistant secretary, saying that he could see no objection why the bill should not be enacted.

California men have heard of the decision of the Supreme Court of the United States finally declaring that the President of the United States has had power to withdraw vast tracts of oil lands in California and Wyoming, and it is thought that the decision may affect coal and phosphate lands as well. The case grew out of the withdrawal of great tracts of valuable oil lands by ex-president Taft for conservation by the government. He at the time doubted his constitutional right to do so, and asked Congress to validate his deed, which that body did, but the Supreme Court rules that the withdrawal would have stood through the long acquiescence by Congress in such acts by the Executive of the nation. An immediate result of the opinion is that oil companies which obtained entries after the Taft withdrawal, but before legislation by Congress, a few months later, providing for withdrawal, lose their claims on lands which are said to be valued at immense sums. Justice Lamar pointed out that for 80 years the presidents had made such withdrawals, hundreds in number. "Nothing was done by Congress," he said, "which could in any way be construed as a denial of the right of the Executive to make temporary withdrawals of public lands in the public interest. Considering the size of the tracts affected, and the length of time they remained in force without objection, these orders by which islands, isolated tracts, coal, oil, and phosphates were withdrawn in aid of legislation, furnish, in and for themselves, ample proof of Congressional recognition of the power to withdraw." About 2,871,000 acres are involved in the decision, which was not a unanimous one by the court, three justices dissenting, Van Devanter, Day, and McKenna, the two former being the western representation on the court. A large sum of money that has been impounded from oil taken from this land goes to the national treasury, and it is said that development work estimated at $10,000,000 is forfeited by the entrymen. Titles claimed by more than 100 companies are made void. Suits over Kern County oil lands involving $20,000,000 are said to hang on this decision. Appeals to Congress for relief are being heard talked about.

SAN DIEGO, CALIFORNIA

Mining Exhibits at the Panama-California Exposition.—Ygnacio Mining Company.

The Panama-California Exposition, which opened in this city on New Year's day, contains much of interest to mining men. In the various state and county buildings there are some fine exhibits of different ores.

In the New Mexico building there is, possibly, more attention given the mining exhibit than in some of the others, as that state has sent one of its best qualified men, the head of the state school of mines, Mr. Jones, to take charge of that part of the display. To visitors are given samples of ores and printed matter discussing the mining resources of that state. Here are also to be found the gold specimens which

MODEL OF GEM MINE, ARRANGED SIMILAR TO A CALIFORNIA TOURMALINE PRODUCER.

took first prize at the Columbian Exposition at Chicago in 1893. They are the property of J. Van Houten, of Raton, New Mexico, and include both nugget and placer gold. One nugget weighs 13 oz. The collection is valued at $2000.

A novel feature of the 'Isthmus,' as the amusement quarter is known, is the model of the famous Pala Chief gem mine. This concession has been patterned accurately after the original mine, which is situated about 70 miles from this city, on Palomar mountain. The adits show how kunzite and other gems are found in the rock, and there is one pocket, protected by heavy plate glass, in which are gems in the rough, to the value of about $20,000. A complete miner's outfit is shown. In connection with the concession there is a room where finished gems are sold, and also a lapidary department where the process of cutting the gems is shown.

Unique among the ores shown is the 'brass ore,' which contains all the metals—tin, copper, and zinc—which constitute brass. This ore comes from Magdalena.

The only meerschaum deposit in America, which is worked commercially, is represented by several large blocks.

Articles of incorporation have been filed with the county clerk by the Ygnacio Mining Co., with a capitalization of $1,000,000. The incorporators are P. M. Price, W. L. Tibbals, S. G. Ames, O. Whitmore, and C. A. Babcock, Jr., all of this city, and Frank C. Everett and L. A. Everett, of Keeler, California.

KALGOORLIE, WESTERN AUSTRALIA

Gold Production in 1914.—Sons of Gwalia Mine.—Edna May to Be Sunk Deeper.—Work in the Calc-schist.—December Returns.

The year 1914 closed with a total gold yield of $26,186,750, against $27,907,985 in 1913, a decrease of $1,721,235. Four mines alone are responsible for a shortage of $1,780,000, namely, Golden Horse-Shoe, $630,000; Victorious, $550,000; Ivanhoe, $450,000; Bullfinch, $150,000; and smaller declines have been made by others. Against this the Edna May, which produced only $216,000 in 1913, increased its output during 1914 by $650,000, to $860,000. The outlook at present is not in favor of any increase in production.

The gold yield of the state in December amounted to $2,182,220, the principal producers being as follows:

Name.	Tonnage.	Value.	Profit.	Dividend.
Great Boulder	15,728	$224,150	$123,750	$328,120
Kalgurli	9,740	101,900	45,700	.....
Ivanhoe	18,326	152,300	45,000	.....
Edna May	2,908	62,800	41,200	32,130
Sons of Gwalia	14,021	108,400	34,300	45,600
Fenian	3,200	53,000	30,500	.....
Golden Horse-Shoe	20,173	146,100	27,800	.....
Sand Queen	2,200	43,500	27,000	22,500
Lake View & Star	16,610	97,300	17,500	60,000
Oroya Links	11,300	65,000	13,470	71,800
Queen of the Hills	4,402	30,600	11,300	.....
Bullfinch	6,676	42,500	11,290	.....
Menzies Consols	2,275	29,300	10,900	28,000
Ingliston Consols	1,800	22,500	10,500	.....
South Kalgurli	9,843	60,000	9,300	.....
Mararoa	2,660	23,900	9,000	25,000
Yuanmi	6,013	58,100	6,300	.....
Ida H.	1,390	23,200	5,200	35,300
Golden Ridge	2,348	15,000	2,500	.....
Kyarra	930	10,500	2,300	.....
Edna May Central	1,956	7,200	820	.....
Associated	10,184	54,900	200	.....
Associated Northern	1,058	10,700	640	.....
Lake View Consols	9,000	5,400	*210	.....
Commodore	540	3,900	*1,100	.....
Victorious	2,300	16,400	*1,300	.....
Great Fingall	3,913	31,400	*12,000	.....

Total yield, $600,589,400. Total dividends, $125,982,300.
*Loss.

During the year the Sons of Gwalia mill treated 160,964 tons yielding $1,257,500, against 162,101 tons and $1,267,000 in 1913. The profit was $383,200, compared with $327,900. Since September 1914 the quarterly dividend has been reduced to $45,600, against $91,200 paid previously. As the alterations and additions to the treatment plant, which were debited to revenue, have now been completed, the old rate of dividend may be resumed. The outlook of the mine is not promising, as the ore in the south end of No. 17 and 18 levels is unprofitable where the lode came into contact with epidiorite. After examining the mine in 1910, and again in 1913, Malcolm Maclaren stated that it all depended whether the intrusion of epidiorite was merely a spur or the main body of rock, whether the gold content would continue or be cut off, at the lower levels. A winze, sunk from No. 19 to 20 level at 1530 ft. south, started in ore worth $8.16 per ton, and finished in ore worth $4.08 per ton only. This is ominous, especially as shareholders were first told by Cyril Wanklyn, chairman of directors, of Mr. Maclaren's report on the epidiorite at the last annual meeting of the Company in April 1914, or four years after Mr. Maclaren had made a full geological examination and report on the mine.

Shaft sinking is under way at the Edna May mine from 225 ft., and it will be interesting to see whether any further granite intrusions are found, and what their effect on the lode is. The second granite bar, passed through in the shaft at 201 ft., was 8 ft. wide, and should penetrate the lode at a depth of 10 to 20 ft. below the 225-ft. level; but, so far as known, no bore has been down to test the result. The 10-shilling ($2.40) shares are quoted at 150 shillings ($36), and if the granite cuts off the lode as it did in its adjoining neighbor, the Greenfinch, there will be a rush to sell.

During 1914 the Oroya Links mill treated 145,130 tons for $794,600, against 139,130 tons and $748,700 in 1913. The profit realized in 1914 was $130,400, compared with $130,600 in 1913. At the end of 1913 there was a bullion reserve of $6450, which has since been absorbed. The workings in the Eclipse mine are entirely in calc-schist, and the ore-shoot still persists at the 900-ft. level, though, as will be seen from the returns, the grade is low; but it always was so in this property.

Both at 2200 ft. of the Perseverance and Lake View Consols mines a good ore-shoot of fair length has been opened, and the managers of both mines are persistently pushing on developments in the calc-schist.

AUSTIN, TEXAS

A Probable Revival in Spring.—Taxes.—Southeastern Mining Co.—Presidio Silver Mine.—Terlingua Quicksilver District.

Although there is comparatively little new mining development going on in the Quitman mountains and other localities of the upper Rio Grande border region, prospects for a revival of the industry when spring opens are considered to be favorable. An effort will be made to have that provision of the state mining law repealed which places a tax of 5% on the gross value of the mineral output of properties located on state land. The law is regarded as oppressive and defective in other respects, and unless it is amended not much prospecting and development on the public lands can be hoped for.

The Southwestern Mining Co., which is operating a mine 10 miles west of Sierra Blanca, is making regular shipments of zinc and copper concentrate to the smelter at El Paso. The workings of the mine are now down 350 feet.

The Presidio Mining Co., at Shafter, kept up its usual steady production during last year, and it is expected that there will be no decrease in its output during the present year. The value of its ore production for 1914 was approximately $200,000. It is considered remarkable by practical mining men that this property, which has a record of having produced a total of about $14,000,000 worth of ore during the thirty and more years of its operation, should be the only mine in the Shafter district.

No plans for further development of the rich quicksilver deposits of the Terlingua district, situated near the Rio Grande, 90 miles south of here, have been announced for the current year. The Chisos Mining Co. is at present the only concern that is operating in that district. This Company had an output of about 3000 flasks during 1914. Its 20-ton furnace is kept in regular operation on the cinnabar ore that is now being obtained from the 600-ft. level. Unconfirmed reports have been current from time to time during the past few months that two or three of the properties which were shut down on account of the flooding of their lower workings, and possibly for other reasons, were to be reopened, but nothing in this direction has as yet been done. It is well known that the cinnabar ore covers a large scope of territory around Terlingua, but the remoteness of the district from railroad transportation has caused it to be given but little attention by mining men. It is reported that the reorganized Kansas City, Mexico & Orient railroad will extend its line from Alpine south to the proposed crossing of the Rio Grande six miles below Presidio, and that it will build a branch line to Terlingua. If this is done, it is thought activity in quicksilver development around Terlingua will quickly result.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

Juneau

On February 20 the Alaska Gastineau company's new mill was in full operation, and working smoothly. Ore trains were arriving regularly from the Perseverance mine.

Tanana

On Elephant creek, a tributary of Wilson, entering it on the left limit above Disappointment creek, George M. Pilcher, of Nome, is prospecting. He is using a hand churn-drill. Edward & Shepard, of Nome, have imported a gasoline power drill made by the Flume Dredge Co. of Nome, and are planning to start work on the same stream. William Staples reports having found prospects on No. 9 Above Discovery, Wilson creek, but the discovery has not been confirmed as yet. Robert Henderson and W. C. Freeman are engaged in

YUKON GOLD CO. DREDGE ON FLAT CREEK, IDITAROD.

development on a quartz deposit 15 miles northeast of Marshall City, a settlement that has taken shape on the right limit of the Yukon near the mouth of Wilson creek. They report excellent surface indications. Tom Plunkett and N. Patton are prospecting a deposit of quartz containing free gold, galena, and molybdenite on the divide between Disappointment and Willow creeks. Willow creek is a tributary of the Bear, which enters the Yukon six miles above Wilson creek. Placer prospects have been reported on Willow creek.

Wilson and Disappointment creeks have wide U-shaped valleys. Wilson creek is about 10 miles long, and at the mouth of Disappointment creek has a width of 1000 feet.

ARIZONA

In *The Wickenburg Miner*, J. H. Mulholland, of the Monarch Mining & Smelting Co., discusses the need of a bureau of mines for Arizona, consisting of a state mining engineer, a county mining engineer, an assay and analyzing laboratory, and a publicity department, costing about $132,000 per year.

Cochise County

Work under the Phelps-Dodge management has progressed so well at the Tombstone mines that it is probable that the stamp-mill will be working in about 60 days.

All traffic from Douglas into Sonora *via* Agua Prieta has been stopped again by General Calles, who is probably trying to keep secret the movements of his forces. Six Americans, employees of the Nacozari railway, were arrested on February 26, also the superintendent, E. O. Llano. A *fake* charge has been made against them.

Gila County

The assistant secretary of the American Mining Congress, E. L. Wolcott, has been in Globe to interest people in the organization of a local chapter, as has been done in other mining counties. L. D. Ricketts was present at the meeting held, and urged those present to further the project. The Gila County section was formed on February 26 with F. F. Towle as president and W. H. Keegan as secretary.

Greenlee County

The International Mines Development Co., which has four properties in Sonora, Mexico, but is not able to develop them, has a 5-year option on the Ash Peak silver claims in this county, and is about to secure title to them. According to the general manager, Herman J. Wendler, 23,000 tons of ore worth $100,000 net has been opened down to 500 ft., where there is a wide lode containing up to 16 oz. silver and $1.20 gold per ton. The 7 by 11-ft. shaft is to be sunk 300 ft. deeper. After further development, a mill will be erected.

CALIFORNIA

According to the Independent Oil Producers' Agency, the oil production of the state in January totaled 7,698,316 bbl., a decrease of 127,665 bbl. compared with December. The total of shipments was 7,233,766 bbl., an increase of 926,568 bbl. There were 136 wells drilling and 5861 wells producing.

Amador County

The 100-stamp mill at the Kennedy continues to be worked. A description of the new tailing restraining dam will be published in this journal.——The Bunker Hill company is the defendant in suit for $30,000 damages by Mrs. R. Matthews for the death of her son, who was electrocuted at 800 ft. in the mine on May 4, 1913. According to the superintendent, E. H. Hampton, the deceased had no right to be in the pump-room where the fatality occurred. The mine foreman, Robert Christianson, corroborated this evidence. A verdict for $5000 was returned, which is to be appealed against.

Forty stamps are now crushing ore at the Keystone mine at Amador City. C. R. Downs is superintendent, and the mine is opening satisfactorily.——Work has been resumed at the Defender, between Pine Grove and the Mokelumne river.——The Plymouth was visited by Albert Burch and W. J. Loring last week, and they stated that development is to start at the Montezuma mine at Nashville, which the Plymouth Consolidated has under bond.

Butte County

The value of the estate of the late Joseph Gardella, well known in dredging circles in Oroville, has been filed as worth $188,729.——In dispute over the value of gravel from the Success mine, at Thompson Flat, near Oroville, and an arrest for grand larceny, the court appointed two mining men to pan some of the gravel. One-eleventh of a yard was washed, yielding equal to 5c. per cubic yard. The case was dismissed, but the plaintiff was later arrested for perjury.

Calaveras County

At the Royal mine at Hodson the water is being lowered at the rate of one foot per hour. Eight samples of ore exposed in stopes, drifts, ore-bins, in cars, standing on tracks, and broken in drifts, averaged $4 per ton, excluding two high assays. Good progress is being made with the tramway and mill.

It is reported that the Finnegan mine at Carson Hill has been bonded for $75,000, and the Lindsay at Angels has been sold to the Utica for $10,000.

Eldorado County

The owners of the Marble Valley lime quarry, near Clarksville may increase the capacity of their plant this year. The output in 1914 was 16,000 bbl., the property being worked nine months in the year. Fred Dixon is manager. The Portland Cement Co. operates near here at Cool.——The water rights and ditches of the San Francisco-Oakland Terminal Power Co were sold by the sheriff of Placerville on February 23 to the Placerville Gold Mining Co., the former owner, for $56,248. The former concern has a year in which to redeem the judgment. There are 33 miles of canals and 100 miles of laterals, the intake being on the American river, just below Kyburz. The main ditch was constructed in the early seventies to carry water for hydraulicking, and when this was stopped, for irrigation. The property has changed hands several times

Inyo County

During 1914 the Wilshire Bishop Creek company spent about $72,000, making over $250,000 to date. The 10-stamp mill and cyanide plant is ready, and has a capacity of 65 tons per day. Ore reserves are estimated as 24,138 tons valued at $397,000; but about 90 days will be required to make preparations for extraction.

Kern County

In the Randsburg district, the Sunshine mine in February produced bullion worth $6250 from 100 tons of sulphide ore, also four tons of concentrate assaying $900 per ton. This ore was from the 500-ft. level.——A clean-up at the Red Dog custom mill from the King Solomon yielded $3150 from 50 tons.——The Baltic mine was sold at a sheriff's sale last week for $50,075 to A. M. Sweeney of Indianapolis. This is said to be a good property.——The Atolia tungsten mine used to be worked on the leasing system, and since the Company has been operating it has not made as much profit as from the lessees.

Nevada County

The Ragon Development Co., which has bonded the Ragon Flat and Mt. Auburn quartz claims from Robert Nye, is repairing the incline shaft, which is in bad condition after 44 years. Lumber has arrived for the work. Sinking will be started as soon as possible, and an electric hoist and pump installed. M. Gallagher is in charge.——Rain had flooded the shaft of the Major gravel mine near Nevada City last week and covered a pump with 20 ft. of water. The pump would not work, so James Proctor dived into the water, released a valve, resulting in its starting again, and the mine saved from being flooded.

The Golden Center of Grass Valley will hold its annual meeting at Sacramento on March 20, and it is probable that a dividend may be declared. The president, Rodney McCormick, has given hopes to this effect. The mill is working continuously.

Shasta County

The Hydrovacuum Smelting Co. has contracted with the Balaklala Copper Co. to install a 100-ton unit of the Heslewood process at the smelter. F. C. Herrmann is consulting engineer.

Trinity County

(Special Correspondence.)—A shoot of rich ore has been cut in the Democrat mine, about two miles from Weaverville. The main formation is from 12 to 24 ft. wide, with the oreshoots generally a few inches wide. Walls are of porphyry and serpentine. Two adits, connected by a rise, have been driven on the orebody, the lower one cutting it about 50 ft. below No. 1 level. A small rotary mill is operating. E. E. Harrigan is managing owner.——The Horseshoe Mining Co. is arranging to resume operations at the Tunnel placer mine early in April. The sections of the cement dam destroyed by water last fall will be rebuilt.——The Trinity Development Co. plans the resumption of prospecting in the Carrville-Trinity Center field in the early spring. The Company holds options on ground extending for approximately 10 miles along the Trinity river and tributaries. Extensive areas of the land have been prospected with Keystone drills, and it is understood dredging operations are contemplated.——The vein in the Enterprise mine, at Helena, has widened to eight feet. Some free gold shows and the 10-stamp mill is kept busy. R. A. Skinner is manager.—High-grade telluride ore has been opened in the Yellow Jacket, near the Enterprise. This is the first time telluride has been found in the district and has created much interest. The property is owned and operated by Boyd, Carter, and Tourtellotte.

Weaverville, March 1.

There is 15 ft. of snow at the Globe mine at Dedrick, but the mine and mill are worked as usual, every protection being arranged for this.——The Trinity River Mining Co.'s dredge is also operating.——Three giants are sluicing at the Trinity Consolidated company's Union Hill gravel claim. The year's output was about $417,000.

COLORADO

The thirteenth biennial report of the commissioner of mines, T. R. Henahen, transmitted to the governor on December 15, 1914, is now to hand. It consists of 228 pages, with illustrations and an index. Inspectors in the four districts are as follows: No. 1, Central City, W. H. Parenteau; No. 2, Cripple Creek, James T. Stewart; No. 3, Leadville, John R. Curley; and No. 4, Montrose, Samuel Treais. Reviews of each of these districts are given under each inspector's name. Subjects discussed include cement, clays, acid manufacture, conservation (leasing), Colorado Metal Mining Association, legislation, geology, labor troubles, accidents, safety first, metal production, laws, the Cresson mine, and papers by W. F. Raber, W. G. Haldane, G. E. Collins, Fred Carroll, John Tait Milliken, R. R. Bryan, T. B. Crowe, C. H. Hanington, Philip Argall, Ott F. Heizer, C. R. Wilfley, Henry I. Seemann, J. A. Becker, Carroll M. Carter, C. F. Lake, Bulkeley Wells, A. R. Livingston, W. E. Tracy, C. E. Anderson, R. M. Henderson, R. E. Schirmer, J. M. Flannery, B. S. Revett, J. D. Endicott, and J. F. Manning. Miscellaneous information shows the altitude of mountains in the state, men employed in mining (22,409), recommendations made by the commissioner's department to mining companies, what each county produces, quarries, and radium-bearing ores. Colorado mining activities are thoroughly covered, and all should secure the publication.

Clear Creek County

Lessees in the Capital mine are all working in ore and making good shipments.——The Onondaga company is mining both milling and smelting ore, a 200-ton lot being treated at the Capital mill. Above the Capital tunnel the Company has 6 to 14 in. of ore for a length of 75 ft.——Lessees at the Seven-Thirty are opening lead-silver-zinc ore.

Gilpin County

The Iron City mill is working full time, and there are over 20 cars of ore on the siding awaiting treatment.——The May County, Hampton, and War Dance mines in Lake and lower Russell districts, have been examined by W. B. Milliken, of Cripple Creek, and he thinks that the $4 to $6 ores can be profitably treated. The Hampton-Clay County Consolidated Mines Co. was organized to operate these properties. John Larson is mine manager, and a number of men have started work.——The owners and lessees at the Chase, Pozo, Prize, Frontenac, First National, Ute, and Pittsburg Extension mines are all busy.

Teller County (Cripple Creek)

There is renewed talk of the sale of the Golden Cycle company's properties.——Control of the El Paso Consolidated is

to be an interesting feature of this Company's affairs.——The Copeland Sampling Co. paid the Cresson company $468,637.29 for the rich ore passed through its plant on January 27. Another recent shipment of 68 tons averaged 65 oz. per ton, which returned $82,000 net. More ore is being extracted, but the Golden Cycle mill and smelters will not accept the very rich ore so it is to be mixed with lower-grade material to bring the average to about 50 oz. per ton.

IDAHO

Idaho County

(Special Correspondence.)—The three principal properties at Profile have just recently made test shipments of one ton of ore each by parcel post, through the newly established office at Profile, and the Butte smelter returns were satisfactory, considering the fact that nothing was paid for lead, and only 95% of the gold and silver. However, the mines are preparing to make more extensive shipments by parcel post next season, but in the future the ore will be sent to a Salt Lake City smelter. It is estimated that $75 ore can be made to yield a good profit by shipping by this method, and there is a fair tonnage of surface ore of this grade that can be obtained by close hand sorting.

The Big Creek district as a whole is not very active this winter, but the prospects are good for a lively stir next season.——The Eagle Mining Co., at Edwardsburg, has again resumed operations after a six months' shut-down, and it is thought that more development will be done than before.——It is reported that the Probiglo Mining Co., of Profile, is planning the installation of a two-stamp mill and concentrator tables on its property next season.

Profile, February 11.

The Center Star mine, owned by Murphy, Tiedemann & Brown, has been sold for $50,000. The Mineral Zone, of the estate of the late Mrs. Parr, and the Blue Ribbon, have also changed hands.——Considerable activity is expected in the Elk City-Newsome district this summer. The Black Pine will add five stamps to its mill.

Shoshone County (Coeur d'Alene)

The owners of the Maher and Hearn claims, Eugene R. Day, Harry L. Day, and M. J. Maher, have filed suit against the Marsh Mining Co. The plaintiffs allege that on January 1, 1914, and prior thereto, they owned and were in possession of the Iron Queen claim in the Lalande district, and that the Marsh company, claiming to be the owner of the December lode, has caused it to be surveyed for patent, so that it overlaps the Iron Queen lode, the area in conflict being 1.159 acres. It is also alleged that the plaintiffs are owners of the Blue Jay lode and that the patent survey of the December lode also overlaps this claim, the conflicting area being 3.335 acres. The plaintiffs ask the court to quiet their title to the conflicting areas.

On March 4 the Bunker Hill & Sullivan company will pay dividend No. 210, of $81,750, making a total of $15,955,500.

The new Nordberg electric hoist at the Marsh mine is working satisfactorily. The only work being done at this lead producer is in shaft-sinking. At 685 ft. the drift is out 350 ft., all in milling ore.——The Interstate-Callahan zinc mine's mill is to be increased by 30% in capacity. One or two aerial tramway routes are under consideration for the delivery of ore and concentrate. During January the mill produced 4022 tons of 50% zinc concentrate.——A large pump is being installed at 900 ft. in the Hypotheek. The shaft is to be sunk from 900 to 1100 ft. when it is working.

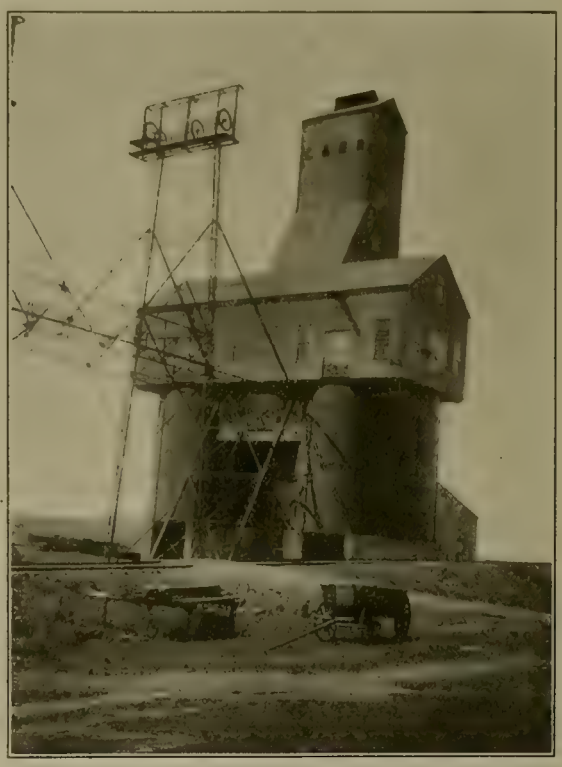
MICHIGAN

Houghton County (The Copper Country)

The annual report of the Victoria Mining Co. includes the following data: copper produced, 1,486,242 lb.; value of metal sold, $133,867 ($163,668 in 1913); total revenue, $282,311 (including assessment No. 6 of $74,234); surplus, $29,938, but comparing value of copper produced, etc., and operating costs there was a loss of $30,388, copper on hand, $62,205, and net assets, $40,624.

The Wolverine company will pay $1 per share on April 1, an increase of $2 over the dividend on October 1, 1914.——About 80% of the steel for the Isle Royale mill is erected and machinery is to be installed at once. The three stamps are to be sent to Milwaukee for repair.——The Franklin mill is being prepared to crush 'rock' from the Hancock, South Lake, and New Arcadian mines.——According to the superintendent of the Trimountain, Richard Bowden, the great 'mass' copper in this mine is still being cut up. Last week 30 tons of metal was extracted and sent to the smelter. Air-chippers are used to cut the mass.

Work is to be resumed at the Hancock mine, about March 1, which means the employment of over 200 men. The Franklin mill may be used to crush 'rock' from this mine. Old employees will be given preference over others on application for work.



SHAFT AND ROCK-HOUSE AT THE HANCOCK MINE.

MISSOURI

Jasper County

A 2200-ft. flume, the largest in the district, has been constructed by the Saginaw Mining Co., southeast of Joplin. Its use is to convey water pumped from the mine so that it cannot flow back into it. A 6-in. centrifugal pump is already in operation on this land, and two 11-in. walking-beam pumps are being installed.

MONTANA

Granite County

The Wasa claims, at the head of Dunkelberg and Douglas creeks, between Philipsburg and Drummond, have been sold by John Zundel to eastern people for about $75,000, M. N. Johnson, of Salt Lake City, putting through the deal. About 2400 ft. of adits has been driven, and a large tonnage of ore

developed. A 250-ton mill is to be erected, using a flotation process.

Lewis and Clark County

Results of the Helena Mining Bureau's activities are showing in several directions. At the Wayside claims in the Scratch Gravel hills, the Blue Bird shaft is down 45 ft. in a strong mineralized quartz vein, assaying from $11.65 to $30.30 per ton.——At the Hawkeye the shaft has reached a depth of 260 ft. This will be sunk to 350 ft. At 80 ft., three feet of oxide ore was cut, which will be opened later.

Lincoln County

Development at the Missouri claims on Leigh creek, 15 miles from Libby, has resulted in three gold-bearing veins being cut, and prospects generally are good.——Development in the St. Paul claims, 18 miles from Libby, has opened some silver-lead-copper ore in an adit, which is 600 ft. long.

Silverbow County

The state engineer, A. W. Mahon, has compiled a list and areas of the counties of this state. There are 41 in all, with a total area of 147,182 square miles. Of this, Silverbow county consists of only 698 square miles, but is the most important from a mining point of view.——Between 175 and 200 men are working on the many claims and leases in that part of the Butte district in which is the Anaconda company's Alice claim. Some are stripping ore.

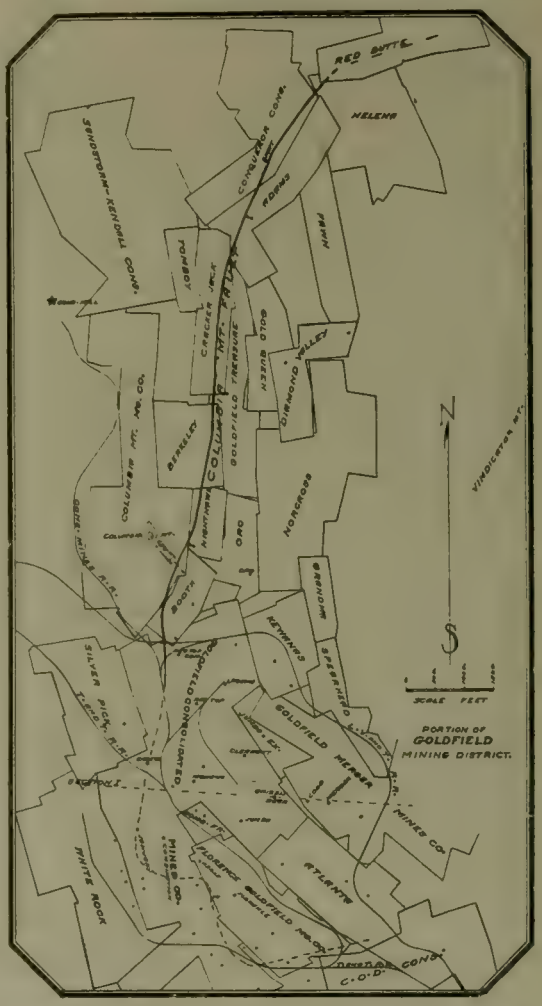
Among the information in the Butte & Superior company's report for the last quarter of 1914 is the following: Approximately 500 ft. of the shaft between the 240 and the 725-ft. level was carefully and thoroughly retimbered with the best material and in a manner which will probably protect the shaft at this place for several years to come, though the shaft above this point may need some further attention, probably not extensive in character, within the next two years. The principal development during the period was the cutting of the Deadwood vein in the 1228-ft. cross-cut on the 1200-ft. level. This is the same vein that has been developed for some distance on the 1000-ft. level, and will be given particular attention on the 1200-ft. level in the effort to explore it as rapidly as possible. No commercial ore is shown at the point at which it was cut. A large addition was made to the miners' change-house in order properly to care for the large number of men that are now working underground. The hoisting skips were increased from 3½ to practically 5-ton capacity, and this is proving of great advantage in hoisting. The copper and mine ore-bin grizzly were also remodeled, and give improved results. A new drill-sharpener for water-drills was installed, and a safety device attached to the small hoist similar to the one which has proved so satisfactory for the large hoist.

Lessees at the Reliance company's mine in the Moose Creek district, 20 miles south of Butte, have cut 12 in. of rich silver-copper-lead-gold ore, and some will be mined and hauled to Butte.

NEVADA

Esmeralda County

Litigation is to have a turn at Goldfield, and two suits of great importance were filed last week in the United States district court at Carson City, one being an apex suit by the Reorganized Booth Mining Co. against the Jumbo Extension Mining Co., in which the Booth company claims the apex of the Jumbo Extension orebodies, alleging that the ore recently taken from the Velvet claim of the Jumbo Extension can be followed to an apex in the Booth ground. The other suit is by the same plaintiff, which demands restitution for the extraction of 15,000 tons of ore of an average of $60 per ton, amounting to $900,000, and to restrain the Jumbo Extension company from further trespassing on or removing ore, or paying dividends or disbursing any money received from ore extracted from the Velvet claim. A temporary restraining order was issued by Judge Farrington, and formal hearing on the application was set for March 5. In the equity suit the Goldfield Merger Mines Co. is made a defendant with the Jumbo Extension, but only as to the Velvet claim, because some of the minority stockholders of the Merger have questioned the legality of the sale of the Velvet claim by the Merger company to the Jumbo Extension. The Merger company is made a defendant to this extent in order to quiet title to the orebodies. It is understood that work in the Booth mine has for some



time been directed for the purpose of determining that the Booth property covers the apex of the orebody in the Velvet claim of the Jumbo Extension, and continues into the claims of the Merger property. These suits may have an important bearing on the settlement of a suit recently started in Seattle by minority stockholders of the Merger company for the appointment of a receiver for the Merger company on the grounds that the sale of the Velvet claim to the Jumbo Extension was illegal, and which may be the forerunner of a suit for the recovery of the Velvet claim for Merger stockholders. As a result of the receivership suit, and other litigation which would probably ensue, various propositions have recently been under consideration by controlling factors for the consolidation of the Merger Mines, the Jumbo Extension, the Kewanas, and the Reorganized Booth, on some basis that might be finally agreed upon. Conferences have recently been held in San Francisco to discuss the situation, also, the hearing on the application for a permanent receivership for the Merger company and the Goldfield Deep Mines Co. has been continued

until April 10, in an effort to adjust all pending differences.

The temporary restraining order issued against the Jumbo Extension company enjoins it from disbursing any funds, and from distributing the dividend of 5c. per share which was to have been paid on March 1. The mine has been closed, but it will be kept drained and in good condition.

Ore worth $15 per ton is being shipped from the Atlanta, being extracted from a rise above 1750 ft.——The Florence is sending 50 tons every other day to the local sampler from the 250-ft. level.——In the Kewanas a drift is prospecting in the shale contact.

The Goldfield Consolidated company will pay 10c. per share on April 30. The yield in January gave a net return of $243,-973 from 30,569 tons of ore. Costs totaled $6.01 per ton. Development amounted to 3079 ft. at $6.12 per foot. On the 230-ft. level of the Combination, 100 ft. northeast of the shaft, the 292-Z sill gave 123 tons of $77.30 ore. At 450 ft. in the Laguna, 700 ft. south of the shaft, 253 drift produced 72 tons of $25.01 ore. Lessees extracted ore worth $26,100, the Company receiving $14,169 gross.

Humboldt County

In 1914 the Seven Troughs Mining Co. had 22 lessees working on its property, who paid royalties amounting to $5032. Development totaled 2238 ft., and 565 tons of ore yielded $29,192. The orebodies in general are pockets of small size, according to the manager, C. W. Poole, and there is no ground at present warranting Company work.

Lyon County

There are 25 men working on the Pittsburgh-Dolores mill, which is nearly complete. E. J. Schrader is general manager and C. R. Olson metallurgist.——Development at 200-ft. in the Nevada-Progressive mine has opened 4 ft. of gold-bearing ore.

Nye County

Pipe for the Round Mountain company's placer ground in Smokey valley is being delivered, and it is hoped to start sluicing in June. Six mines at Tonopah yielded 10,367 tons of ore worth $212,566 during the last week of February.——On April 1 the Extension will pay 7½c. per share, a total of $70,749.——A promising development has taken place at 850 ft. in the Monarch Pittsburg, and it is too early to give definite results, but it is hoped to be an extension of the Murray vein.

OREGON

The Oregon state legislature last week passed an appropriation bill for the mining bureau, amounting to $25,000, which is $16,000 less than that voted in 1913. The sum of $10,000 was also allowed to be spent on a mineral exhibit at the Panama-Pacific Exposition.

Jackson County

An interesting dispute is taking place between the Public Service Corporation and the California-Oregon Power Co. over the possession of a transmission line which runs up Kanes creek to the Braden mine.

Josephine County

The Waldo copper mine has been sold to J. F. Reddy and A. H. Gunnell of Grants Pass. The last work done on the property was in 1912, when 1980 tons of ore yielded about $60,000. This was hauled to Grants Pass, 42 miles, and then railed to the Tacoma smelter. The output to date is $250,000, and underground workings cover 4000 ft., while a large tonnage of ore is ready for extraction.

UTAH

Beaver County

In the Leonora mine, in the Star district, the silver-lead orebody has been opened 195 ft., assaying 107 oz. silver, 35% lead, and $3 gold per ton. A vein of ore containing from 24 to 45% zinc occurs next to this shoot. Shipments of ore are soon to start.

Juab County

It is now found that the deep mines of Tintic cannot be drained by the proposed tunnel mentioned in the *Press* of last week. Ore shipments from 13 mines in the week ended February 26 totaled 90 cars.

CANADA

British Columbia

In the provincial mineralogist's preliminary review of British Columbia for 1914 are notes on the various districts. The Cariboo and Quesnel divisions are restricted almost entirely to placer mining. Generally the clean-ups were satisfactory in the former. The gravel on Williams creek and Willow river was tested for dredging.——In Quesnel the larger hydraulic properties were not worked on account of litigation and waiting until the railway has reduced freight charges, two lines having been constructed.——More activity is evident in the Omineca division, which will be described in the *Press* next week, and rich gravel was sluiced by the Kildare Mines Co. on Slate creek. Lode mining was also done, but some of the ore was not shipped. On the Rocher Déboulé Copper Co.'s property the leasing company drove a long crosscut adit, and made a large expenditure on surface improvements.——The Atlin division of the Cassiar district produced gold worth $322,000, equal to 61% of the provincial output.——The Engineer mine's 2-stamp mill, on Taku arm, produced about $20,000 by amalgamation of a high-grade antimonial arsenide ore occurring in a quartz-calcite gangue. This ore assayed up to $6800 per ton in places.——In the Skeena division, the important property is the Granby company's copper mine at Anyox, where about 9,500,000 tons of 2.2% ore has been proved. The smelter, which was blown in on March 15, treated 260,000 tons to the end of 1914, containing 12,000,000 lb. copper, 2800 oz. gold, and 130,000 oz. silver.——The Granby Consolidated and Tonopah Belmont companies did a lot of work on Princess Royal island.——In the east Kootenay district, the Sullivan group produced 35,500 tons of ore containing 24,183,000 lb. lead and 474,500 oz. silver. Three coal companies operate at Crowsnest and the output was 972,000 tons of coal and 237,931 tons of coke.——The west Kootenay region is still one of the most important in the province, and includes the Bluebell, Consolidated Mining & Smelting, and other mines in the Ainsworth division; Rambler-Cariboo, Slocan Star, Surprise, Standard (with a yield of 890,000 oz. silver, 12,000,000 lb. lead, and 4,000,000 lb. zinc), Van Roi, and others in the Slocan divisions; the Nelson division; and Trail Creek with an increase of $200,000 over the previous year, the Trail smelter's output being worth $6,000,-662, although ore came from all of the divisions mentioned in the west Kootenay area.——The metal yield of the Boundary district was 83,830 oz. gold, 328,276 oz. silver, and 16,383,-629 lb. copper, decreases of 18, 17, and 43% respectively, due to the closing of smelters owing to the war. Apart from the Granby and British Columbia companies' operations, which are well known, the Jewel-Denero Mines, Ltd., 15-stamp mill, eight miles from Greenwood, treated about 16,000 tons of ore, yielding 6500 oz. gold and 33,000 oz. silver.——In the Vancouver division the Britannia company milled 240,272 tons of ore containing 250 oz. gold, 70,000 oz. silver, and 12,000,000 lb. of copper. A large number of improvements were made to the equipment.

Dating from February 1, wages of the Granby Consolidated employees at Phoenix and Grand Forks were raised 10%. When work was resumed in December a 25% reduction was made, and in January a 5% raise was given.

Yukon

Recent reports from the Mayo district state that development of the silver claims on Galena creek is yielding good results, and ore is being placed on the dumps, and hauled to the landing. The McWhorter mine employs 10 men, where there is 4 ft. of ore at 130 feet.

PERSONAL

W. H. Howard has been spending a holiday at Tacoma.

William A. Prichard returned from London on Monday.

William Braden is on his way from Chile to New York.

H. Foster Bain expects to leave for London on March 28.

T. A. Rickard sails from England today on his way to San Francisco.

C. W. Purington sailed on the S.S. *Tuscania* for Liverpool from New York on February 20.

John W. Pack, of Berkeley, has been appointed chief assayer at the San Francisco Mint, a position he formerly held.

James J. Ormsbee, manager of the Hayden plant of the A. S. & R. Co., will be at the Tacoma plant for a few weeks.

Leslie H. Webb, secretary of the Wedge Mechanical Furnace Co., of Philadelphia, is in San Francisco for a few days.

August A. Busch, head of the Busch-Sulzer Bros.-Diesel Engine Co., of St. Louis, is in San Francisco inspecting his firm's exhibit at the exposition.

Frederick G. Farish has recently been made manager for the Lluvia de Oro Gold Mining Co., of Chihuahua, Mexico, and is on the way to the mine to take charge.

A. C. Selby, formerly with the Union assay office of Salt Lake City, has been appointed chief chemist for the new mill at Rochester, Nevada, which is nearing completion.

C. H. Repath, senior member of Repath & McGregor, smelter builders and supervising engineers, was at Douglas, Arizona, recently, after a visit to the Arizona plants built by his firm, which has just completed the Clarkdale plant of the United Verde company.

The Mining and Metallurgical Society of America will give a farewell dinner to H. Foster Bain on the eve of his departure for London, where he is to assume the editorship of *The Mining Magazine*. This, a joint dinner with the A. I. M. E., is to be given at the Hotel Bellevue, corner of Taylor and Geary streets, on March 9, 1915, at 6:30 p.m. All are earnestly invited to attend the dinner and the meeting of the section at 6 p.m. to elect a chairman for the local section of the Mining and Metallurgical Society.

Obituary

A solution of the mysterious disappearance of Michael Cooney, of Socorro, New Mexico, well known mining man and member of the board of regents of the New Mexico School of Mines, was found with the discovery of his body, on February 14, by a posse, in a remote spot in the Mogollon mountains. Captain Cooney left his home at Socorro on October 26, answering the call of the West for a last prospecting trip. Strapped to the horn of the saddle of his horse was a small handbag in which was found his diary which told the story of his wanderings and death. Out of respect to him the House of Representatives at Santa Fe adjourned on the afternoon of February 19. He leaves a wife and son and many friends.

Thomas Henry Oxnam, one of the best known mining engineers on the Pacific Coast, died at his home in Los Angeles, February 16. He was born September 17, 1854, at Pool, Carn Brea, Cornwall, England, and as a young man began his mining career in the tin mines of Cornwall. In 1875 he left England and spent two years in South Africa contracting railroad tunnel work for the British government, and in 1877 came to America and settled at Virginia City, Nevada. From 1877 to 1884 he worked in the various mining districts of California, Arizona, and Colorado. In 1884 he entered the employ of the London Exploration Co., of London, and remained with that concern until 1895. During this period Mr. Oxnam was at Marysville and Elkhorn, Montana, De Lamar, Idaho, and Harqua Hala, Arizona. He rose from foreman to mine manager of the famous De Lamar mines at De Lamar, Idaho. In 1895 he left the employ of the London Exploration Co. and became manager and consulting engineer for J. R. De Lamar. In 1901 he was made manager of the Palmarejo & Mexican Gold Fields, Ltd., at Chinipas, Chihuahua, Mexico. While in charge of this property Mr. Oxnam made practical application of the cyanide process for silver ores. Ill health caused him to leave Mexico, and in 1907 he became associated with the Consolidated Arizona Smelting Co. as vice-president and general manager. From 1908 until his death he had devoted his time to private practice. He is survived by his widow, three sons, and one daughter.

Schools and Societies

The Illuminating Engineering Society, Chicago section, held a meeting on February 25, when a lecture was given on the various phases of vision.

The Canadian Mining Institute had 1015 members at the end of 1914. During the past year the revenue was $9898, not including a balance of $3638 from 1913. The amount on hand on January 1, 1915, was $4836.

The Northwest Mining Association of Oroville, Washington, has recently been formed with the main object of giving publicity to the mining resources of the region. All news given out by this Association will be carefully censored by its publicity committee.

The Mackay School of Mines reports that 25 men registered for the short course in prospecting which extends through the month of February. Of these men, 10 registered as prospectors and 4 as miners, so the registration shows that the majority of those entering the course belong to the class of men for which it was intended.

The Utah branch of the A. I. M. E. held its first annual dinner at Salt Lake City last week. There were 47 members present. Speakers were Karl Eilers, of the American Smelting & Refining Co., a guest; Walter Fitch, C. W. Whitley, Ernest Gayford, D. A. Lyon, B. F. Tibby, J. H. Winwood, Lafayette Hanchett, William Wraith, and R. C. Gemmell of the Utah Copper Co., who acted as toastmaster. It was decided to hold a meeting at Tintic in July.

The annual meeting of the Montana branch of the A. I. M. E. was held at Butte on the evening of February 5. More than 50 members and guests enjoyed a dinner at the Silver Bow club, preceding the business and technical session. The following officers were elected for the ensuing year: chairman, F. M. Smith, manager East Helena plant of the A. S. & R. Co.; vice-chairman, J. L. Bruce, manager of the Butte & Superior Copper Co.; secretary-treasurer, D. C. Bard, professor of geology, Montana State School of Mines; and executive committee, Frederick Laist, chief metallurgist of the Anaconda Copper Mining Co. and W. C. Siderfin, manager of the W. A. Clark interests in Montana. The secretary's report shows an active membership in the state of 160. Arrangements were considered for having the branch represented at the San Francisco meeting of the Institute next September. Two technical papers were presented and discussed, (1) 'The Concentrator of the Timber Butte Milling Co.,' by Theodore Simons, and (2) 'The Boulder Batholith of Montana,' by Paul Billingsley. This last paper is to be read at the forthcoming meeting of the Institute in New York, but was presented at the local meeting as well, because of its interest to the local community. The Montana members meet twice a year. It is growing in membership, and its usefulness is being increased as interest in the organization grows among mining men.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, March 4.

Antimony	.20 —20¾
Electrolytic copper	.15½ 15¾
Pig lead	4.15— 5.10
Quicksilver (flask)	$70.00
Spelter	.10¾—11
Tin	.38 39½
Zinc-dust, 100-kg zinc-lined cases	12

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, March 4.—Copper is quiet, and lead and spelter strong.

COPPER

Prices of electrolytic in New York, in cents per pound.

Silver has shown an upward tendency. Shipments from San Francisco to the Orient during the past two weeks amounted to about 320,000 oz. The Cobalt district, Ontario, is only making small shipments to England.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Feb.	4	55.00	Feb. 18 62.50
"	11	60 00	" 24 62.50
			Mch. 3 70.00

On March 4 New York prices were up to 41 cents.

A shipment of tin which arrived at New York direct from the Far East on February 13 on the steamer 'City of Bristol' is believed to have been the largest on record. It consisted of 775 tons from Singapore and 600 tons from Penang. In the few days preceding February 18 a good-sized speculative business was done in the selling of spot by those who immediately replaced the metal they had sold by purchasing early futures, and thereby cleared a profit. When a condition was reached where the holders of nearby deliveries were no longer willing to sell, prices advanced. Spot tin in warehouse was difficult to buy under 40c. on February 19. On that day London advanced £6 on spot and £4 on futures, spot closing at £185 and futures at £159 per ton, c.i.f., London. On February 22 there again were sharp advances in London, but on the following day there were equally sharp declines. The decline on spot Straits on that day was £8. February 24 there was a further decline in London of £3. With these declines in London the domestic market became dull and heavy. It is reported, and believed, that the Dutch government has recently sold to Germany a large quantity of the Banca tin which was stored in Holland. Arrivals up to February 25 totaled 3110 tons, and there was afloat on that day 2510 tons. By February 25 the London quotations had dropped to £178 for spot Straits and £157 10s. for futures.

ANTIMONY

With no English antimony coming here, the indications are that these brands may soon be unobtainable. Business does not appear to have been large in any direction, but the scarcity, coupled with occasional inquiries for export, have sent prices up and they are strong at the higher levels. At the beginning of the month quotations were 18 to 19c. for Cookson's, 17 to 18c. for Hallett's, and 16 to 17c. for Chinese; and on February 26 the nominal quotations were 21c. for Cookson's and 20c. for Hallett's while Chinese was quoted at 18c. duty paid.

ALUMINUM

The market was stationary and without feature at 19 to 19.50c. per pound.

New York Metal Review

The consumption of Lake copper by manufacturers of munitions of war continues on an enormous scale, and prompt deliveries, except on contracts previously placed, are practically unobtainable. Under the circumstances, quotations for spot or early delivery metal are nominal. Electrolytic, though higher in price than it was a month ago, shows evidence of weakness, as it is not sustained by domestic demand. Some industries, which ordinarily consume great quantities of copper, are not busy. Lead holds up well, and the price was advanced $1 per ton on February 16. London is following the United States lead market more closely than has been usual. Spelter and all the products into which it enters have advanced sharply in an excited market. Exports of spelter have been record-breaking, and this, coupled with the demand here, has created a scarcity of choice brands. Tin, under foreign influences, has been up and down continually, though the domestic demand has not been great. Antimony is firm at higher prices. Some tremendous orders for war supplies have been placed in this country for shrapnel, projectiles, cartridges, and the like, and the machines for making them. While in the main confined to a comparatively few channels, this business is radiating to other lines, and there are noted also an increasing number of orders which cannot be associated with the war. Two of the busiest industries in the country are the building of automobiles and ships. Of the latter, over 50 have been ordered in less than three months, and more orders are pending. A slow but positive improvement, one that is in keeping with the general spirit of economy, is noted in business. On February 23 the increase of 5% in the freight-rate schedule of the Eastern railroads became effective, and this should stimulate buying on their part. In fact, some quiet purchases already have been made. Advances of $1 per ton on such steel products as plates, shapes, and bars are announced, effective on March 1.

COPPER

Two things stood out prominently in February, the heavy consumption of prime Lake in the manufacture of munitions of war, and the light domestic demand for electrolytic. Quotations for the latter were sustained mainly by the sympathetic influence of Lake. The New York price of prime Lake at the opening of the month was 15c., but at the end of the first week it had reached 15.25c., cash, and it remained there. Now and then sales were heard of at lower prices, but such transactions were few, as the producers of high-grade brands were reported to be sold out of near delivery metal, and to be only considering deliveries to be made after the opening of navigation on the Great Lakes. There were a few sales of prime Lake out of New York stocks as high as 15.75c. cash. Of course, less favored brands commanded a lower figure, and there were sales reported at 14.87½ to 15.12½c., while arsenical copper was sold as low as 14.62½c. Electrolytic was quoted until about February 10 at 14.75c., cash, New York, after which it dropped to 14.62½c. Second hands led the way in offering concessions. Near the close of the month a weaker trend developed, but prices were practically unchanged. Complaints were heard from the copper-wire mills, and the operations of the electrical industry were far below normal. By order of the Secretary of the Treasury, announcements of exports from day to day were resumed February 15, and figures can now be had which afford a basis for comparison. It is understood that the average production is now 65 to 70% of capacity. Exports in January amounted to 26,193 tons, against 36,018 tons in January 1914. The total of exports in 1914 was 360,229 tons, against 383,810 tons in 1913. Exports in February, to the 26th, amounted to 9584 tons, which indicates a radical decline in foreign shipments, but it is difficult to draw conclusions from export figures now, as shipping conditions are so unusual.

LEAD

In late January and early February a large business in lead was done both on foreign and domestic account, and one result was an advance of 10 points on January 28, to 3.80c., New York, and 3.62½c., St. Louis. Early in February some of the producers asserted they had sold their output for the month, and also said they were disinclined to sell further ahead. About the middle of the month the demand abated to a considerable extent, but consumers continued to talk in a bullish manner and this is said to have been practically the only reason for a further advance of five points on February 16, making the New York quotation 2.85c., and that at St. Louis 3.72½c. Then buying started again and the Western market became stronger and worked up to 3.77½c., although the New York market was unchanged. The European market was firm, as it is expected to be while the war lasts. An interesting phase of the London market is that it shows a greater disposition to follow this market than has ever before been manifested. Requests have come from London for prompt cable advices whenever there is any change in the quotation here. A further advance is believed to be impending. Up to February 25 the exports totaled 934 tons for the month.

SPELTER

The situation is serious. On February 25 the quotations for Prime Western spelter were 9.55c. to 9.75c., New York, and 10.50c. was asked by some producers. On February 1 the quotations were about 7.75c. New York, and 7.60c. St. Louis. One advance followed another in quick succession. Extra choice brass-mill spelter was nominal throughout the month at quotations that mounted as high as 14c. Two influences sent the market up, the heavy exports and the extent to which the brass mills absorbed the metal, both of which may be classed as war demands. A steamer which sailed near the end of January for Vladivostok carried 1950 tons, which was a record shipment. Large shipments to Europe had been made for some time prior to this date. In December, 18,316 net tons of domestic spelter was exported, and 1877 tons of foreign origin. In December 1913 only 68 tons was exported. In the 10 months ended December 1914, 64,802 tons of domestic spelter was exported, against 7783 tons in the same time of 1913. Over 15,000 net tons was exported in January. Exports in February, to the 25th, totaled 4960 tons. Toward the end of February the market was excited, consumers having been roused to the necessity of covering their needs. The prices of galvanized sheets were repeatedly advanced, and sheet zinc kept pace with the cost of spelter. Quotations of the latter product this year have been as follows: January 2, 9c.; January 19, 9.25; January 21, 9.50; January 26, 10; February 2, 10.50; February 4, 11; February 8, 11.50; February 12, 12; February, 19, 12.50; and February 25, 12.75c. At the close of the month the market was uncertain and excited.

TIN

The domestic demand for tin was not great in February, and the reason lies in the upset conditions created by the war. At times, of course, a moderate amount of business was done, and on one day there was good activity. The average prices for spot metal on various days of the month were as follows: February 2, 37.80c.; February 4, 36.50; February 5, 37; February 9, 36; February 13, 35.85; February 16, 36.12½; February 18, 37.25; February 19, 39.45; February 20, 39.50; February 23, 38.60; and February 25, 38c. per pound. The foregoing prices indicate how lively the fluctuations were. On February 1 at least 300 tons changed hands. On that day the lowest price of spot was 37.30c., and the market closed at 38.37½c. The London market was seriously affected by the congestion of freight in that port, and prices were strong. In the first week in February a peculiar situation existed here in that at times the New York price was more than 2c. under the London parity, and 2½c. under import cost.

Current Prices for Oils and Candles

(Corrected monthly by Standard Oil Co. California.)

All prices are f.o.b. San Francisco except where otherwise specified, and are subject to change without notice.

Granite Mining Candles	Per set, cents	Granite Mining Candles	Per set, cents
6s-12 oz.-10s	8¾	6s-14 oz.-20s	9½
6s-12 oz.-20s	9	6s-16 oz.-40s	10
6s-14 oz.-40s	9¼	6s-16 oz.-20s	10¼

Extra hard 1c per set higher than the above.

Roessler & Hasslacher quoted as follows on February 17:

Ammonia, anhydrous, in 50-lb. cylinders, per lb.	$0.27
Arsenic, white powdered, in 500-lb. bbl., per lb.	0.05
Cobalt oxide, black, in 10-lb. tins, per lb.	1.05
Cyanide, potassium, 38.4% cyanogen, per lb.	0.27
Cyanide, sodium, 51% cyanogen, per lb.	0.25
Sodium, metallic, in 1-lb. tins, per lb.	0.40
Zinc dust, in bbl. 1600 lb.	0.12

Owing to uncertain conditions a number of chemicals are not quoted.

BOOK REVIEWS

THE CYANIDE HANDBOOK. By J. E. Clennell. P. 601. Ill., index. McGraw-Hill Book Co., New York, 1915. For sale by the *Mining Press*. Price, $5.

This is the second edition of Mr. Clennell's well known treatise on the chemistry and practical application of the cyanide process. The volume under review contains 81 pages more than the previous one, and every effort has been made to bring the matter up to date. It was not considered advisable to omit any great part of the descriptions of the older methods, these being generally still in use; and new arrangements often need the adoption of systems previously discarded. Section III of Chapter I covers in short the tendencies of modern practice. The chemistry of the process is given practically the same as before. In part III of the preparatory treatment of ore for cyaniding, the comparative utility of various crushing and grinding machines is new, including Lane slow-speed Chilean and Hardinge mills. Also, the following discussions are in addition to No. 1 edition: factors influencing rate of settlement of slime, diaphragm cone classifier, Merrill cone, Dorr classifier, Dorr thickeners, amalgamation in conjunction with cyanidation, skimming tailing dumps, continuous agitation and decantation; the Parral, Patterson, Trent and Dorr agitators; the Merrill press; the modified Butters filter and Oliver filter; zinc-dust and aluminum-dust precipitation; smelting precipitate; treatment of antimonial and arsenical ores; new applications of aluminum in ore treatment; electrolytic regeneration of cyanide; sources of error in assaying ore; assay of silver ore from Cobalt; additional notes on ore analysis (copper, tin, zinc); method for valuation of caustic lime; and tests to determine value of zinc-dust for precipitation, valuable additions to the existing literature. Cyanide workers will always find something useful in this excellent study of a world-wide used process.

SAN FRANCISCO FOLIO. By A. C. Lawson. Geologic Atlas of the United States, No. 193. U. S. Geological Survey, Washington, 1914. For sale by the Geological Survey. Price, 75c.

The making of a geological map of the United States is a huge task. It is one which has absorbed the time and energy of many men for many years, and the work will always be, in any large sense, incomplete. From time to time, however, important parts of the work reach such a stage of completion as to permit publication, and in the various folios of the Geological Survey, most of such material is summarized. The Pacific Coast is young, not only geologically, but is one of the parts of the country that has been studied relatively few years. It is at the same time one of the most complex of the geological provinces. Such areas can only be interpreted correctly upon the basis of long-continued, detailed work, and outside the oilfields and the Mother Lode region there has been little such work done in California. The San Luis Obispo and the Santa Cruz areas are almost the only ones directly on the coast. Lawson's folio, therefore, is of great importance, not only because it illustrates and explains the geology near San Francisco, but because it affords a ready key to the interpretation of a much larger area. It is too long and too detailed to review in full. It is sufficient to say that the formations described range from the Montara granite to the sand dunes of Golden Gate park. Each is described with admirable clearness and detail. There is nothing startlingly new in the interpretation offered, at least to specialists familiar with the literature of the subject, but the whole constitutes the best general summary yet written, and a most effective starting point to serious study of the coast ranges. It is written in terms easily understood by the intelligent layman, and should serve, as it doubtless will, as an important guide to further building and development in the region. As usual in the folios, the accompanying maps represent the highest skill both in the field and office. As examples of what a map should be they may well be cited. Mr. Lawson discusses, with admirable clearness and frankness, the earthquakes of the area and their proper influence on building. He points out that 99% of the shocks are harmless, and that of all the fault lines in the area only two are known to mark zones of active stress. He indicates the possibility that stresses along the San Andreas rift may have been completely relieved in 1906, and suggests methods not only of determining whether earth stresses are accumulating along any line, but also of building in such manner as to safeguard against damage from such shocks as may occur. For the present only the large library edition of the folio is available, but it is announced that a more convenient octavo form is being prepared.—H. F. B.

RECENT PATENTS

1,122,861.—ALLOYED STEEL. James Churchward, Mount Vernon, New York, assignor to Churchward International Steel Co., New York. As an article of manufacture, an alloy steel containing nickel, chromium, tungsten, vanadium, manganese, and silicon.

1,123,685.—PRECIPITANT FOR RECOVERING METALS FROM SOLUTIONS. Galen Howell Clevenger, Palo Alto, California, assignor to Merrill Metallurgical Co. A precipitant for recovering metals from cyanide solutions, consisting of a binary brittle alloy of zinc with alkali or alkaline earth metal.

1,123,966.—METALLURGICAL FURNACE. Utley Wedge, Ardmore, Pennsylvania. A furnace having outer walls, and hearths forming a row of furnace units disposed end to end, rabble arms for the hearths of said row of furnace units, a structure extending alongside of the row of furnace units and carrying the rabble arms of the row, and means for reciprocating said rabble arm carrier.

1,118,012.—PROCESS OF SMELTING ZINC ORES. James M. Hyde, Berkeley, California. The process of smelting zinciferous ores, which consists in heating the ore mixed with flux and reducing agent in an externally heated retort to a temperature sufficient to reduce the metallic constituents, collecting the molten materials in a bath beneath the charge, removing the zinc vapors from the retort above the molten bath, and keeping the bath molten by heat directly applied to the surface thereof outside said retort.

1,124,174.—PROCESS FOR THE PRODUCTION OF TIN OR TIN COMPOUNDS FROM PYRITIC OR OTHER TIN ORES, TIN-ORE CONCENTRATES, TIN-WASTE, TIN-PLATE WASTE, STANNIFEROUS SLAG, TIN-SLAG, AND THE LIKE. Jan Rueb, The Hague, Netherlands. The process for the production of tin compounds from materials containing tin mainly in an oxidized condition, which consists in smelting said materials with a heavy metal sulphide and with slag-forming substances, so as to convert such tin compounds into tin-iron matte.

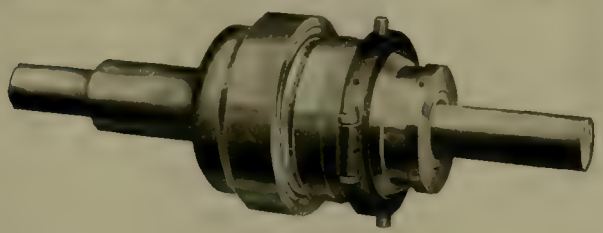
1,126,456.—ORE-BELT EDGER. Albert W. Harp, Angels Camp, California. A vulcanizing outfit for conveyor belts, comprising a frame extending crosswise over the belt and having means to grip the frame on which said belt travels, at the two sides of the belt, a vulcanizing element with heating means supported from beneath the belt and on which the belt rests, and a vulcanizing element with heating means on top the belt and held down thereon in opposition to the underneath vulcanizing element by means carried by said frame.

New Machines and Devices

A Safety Self-Oiling Clutch

After considerable experimental work, the Dodge engineers have originated and developed an improved solid multiple-disc friction clutch, which retains all the good points of the present Dodge clutch with the addition of the important features of safety, efficiency, and durability.

All moving parts of the mechanism of this new apparatus are concealed, making a perfectly smooth contour. There are no projecting moving parts to catch clothing or injure workmen; no cumbersome or unsightly guards or screens are necessary. It is claimed that the design and materials of the multiple friction discs, combined with the new roller toggle operating mechanism, make this the most powerful clutch of its size that has yet come under the observation of mechanical engineers. The rolls on the toggle levers travel on conical surfaces arranged to give high pressure on the friction discs, with a minimum amount of mechanism friction. The use of rollers in place of sliding parts makes the clutch easily operated. The action of centrifugal force tends to keep the clutch disengaged when thrown out. The clutch is self-lubricating,



DODGE SAFETY SELF-OILING CLUTCH.

this being accomplished by an oil ring revolving in a large oil reservoir, giving every satisfaction. The clutch is easily adjusted with a single nut arrangement which is simple and positive. Backing off this nut permits removal of the operating cone, which exposes the toggle mechanism and also permits the removal of the entire inside mechanism for repairs. It takes little space on the shaft, less attention in operation, has a good appearance, and is considered a worthy addition to the Dodge line of power-transmission machinery. This clutch is made by the Dodge Manufacturing Co., of Mishawaka, Indiana, and will be distributed by the Dodge Sales & Engineering Company.

Mounted Jackhamer Drills

The Jackhamer drill was originally designed for drilling down-holes of various depths up to about 12 ft., but due to the light weight of this machine, which is about 40 lb., it was found feasible to employ it for drilling flat holes also. When such holes are to be drilled intermittently, the regular unmounted Jackhamer is a practical tool, but where continuous drilling of flat holes has to be carried on, the effort of holding the drill to the work is apt to tire the workman.

Realizing the need for a mounting that would not be cumbersome, but at the same time would be heavy enough to withstand rough usage, the Ingersoll-Rand Company, 11 Broadway, New York, developed, after considerable testing, the mounting shown in the accompanying illustration, which is known as the 'JM-6' type. The Jackhamer, used in conjunction with the 'JM-6' mounting, has been found thoroughly practical for such flat-hole work as driving and underhand stoping in metal mines where shallow holes are required, and for breaking down coal and driving gangways in coal mines. It takes a very short time to clamp the standard unmounted Jackhamer in the car-

INGERSOLL-RAND JACKHAMER MOUNTING WITH CONE IN EXTREME BACK POSITION, AND MACHINE IN EXTREME FORWARD POSITION.

riage of this mounting. Therefore, a single drill may be used conveniently for the two-fold purpose of drilling flat holes in the heading and down-holes on the bench without loss of time in making changes. A water-feed device of the Leyner type has recently been developed for use with the Jackhamer whenever trouble from dust arises. The 'JM-6' mounting is adapted for use with both plain and water-feed types of Jackhamers. The clamp which grips the handle of the drill is provided with a cushion spring to take up the shock when a steel is being pulled out of a hole. The forward clamp on the carriage does not grip the machine firmly, but serves only as a support and guide. The mounting is made for use either on the arm of a vertical column or horizontal shaft bar, and the cone on which the shell rests will fit into any 5-in. Sergeant saddle or clamp. The sliding cone gives a quick adjustment when setting up and can be used to increase the length of feed whenever necessary. The length of the screw fed is fully 24 in. Adding to this the slide of the cone on the shell, which is over 19 in., it will be seen that a total travel of over 43 in. may be obtained whenever desired. The total weight of the mounting is 63 lb. Steel castings and drop forgings are employed throughout in its construction.

By Way of Correction

O. Henry has said something about persistent Fate standing in the wings and wildly pulling the wrong strings, which is, perhaps, as good a way as any to account for many otherwise unaccountable mistakes. An error in proofs led us a few weeks since to print the picture shown below under the caption 'Water Drill in a Michigan Copper Mine.' In fact, the illustration is of the 'DR-6,' one of the two new hammer-drills placed on the market last year by the Sullivan Machinery Co. Those familiar with the Michigan mines probably smiled at the looks of the formation illustrated. The DR-6 is one of the new type machines. It weighs but 145 lb., but is capable of drilling 12-ft. holes having a diameter of 1¼ in. Hollow steel is used and the hole is cleared by means of air and water under pressure. Both air and water admission are controlled by a single throttle valve. In its first position, air only is admitted to the drill steel; in the second, both air and water; and in the third, in addition air is admitted to valve and piston motion. In closing, the action is reversed, resulting in a jet of air being blown through the drill and steel last thing, and so cleaning it and preventing any access of water to the cylinder of the drill when pointing upward.

It is unnecessary to close the hose line when changing steel. The valve chest is in the rear head of the machine and not on the top or side of the cylinder; as a result drill steel may be changed without altering the position of the drill saddle.

SULLIVAN 'DR-6' HAMMER DRILL IN OPERATION.

The piston is rotated without separate rifle bar, there is an automatic lubricator in the back head, the piston is one piece, and in other particulars the drill combines the latest designing with the best of material. It has proved its qualities as a fast runner, easily cranked and maintaining true holes through fissured ground. The picture and this description are published through the courtesy of the Sullivan company.

The Fuller-Lehigh Pulverizer Mill

This crusher, pulley or gear-driven, fan-discharge type, is made by the Lehigh Car, Wheel & Axle Works, Fullerton, Pennsylvania, and the manufacturers claim the following characteristics for the machine: rigid construction, no inside journals or bearings, no inside lubrication, uniform feeding device, constant and free discharge, low installation cost, low operating cost, dustless operation, grinds to 200 mesh and finer, requires no outside accessory equipment, requires no overhead shafts or drives, all material in the mill is finished product, a single-stage reduction mill, uniform fineness of finished product, and a complete unit.

The material to be crushed is fed to the mill from an overhead bin by means of a feeder mounted on top of the mill. This feeder is driven direct from the mill shaft by means of a belt running on a pair of three-step cones, which permits the operator to accommodate the amount of feed entering the mill to the nature of the material being pulverized. In addition, the hopper of the feeder is provided with a slide, which permits the operator to increase or decrease the amount of material entering the feed hopper. The material leaving the feeder enters the pulverizing zone of the mill. The pulverizing element consists of four unattached steel balls which roll in a stationary, horizontal, concave-shaped grinding ring. The balls are propelled around the grinding ring by means of four pushers attached to four equidistant horizontal arms forming a portion of the yoke, which is keyed direct to the mill shaft. The material discharged by the feeder falls between the balls and the grinding ring in a uniform and continuous stream, and is reduced to the desired fineness in one operation. Fan discharge mills are fitted with two fans. One of these operates in the separating chamber immediately above the pulverizing zone, while the other works in the fan housing immediately below the pulverizing zone. The upper one lifts the fine particles of pulverized material from the grinding zone into the chamber above the grinding zone, where these fine particles are held in suspension. The lower fan acts as an exhauster, and draws the finely divided particles through the finishing screen which completely encircles the separating chamber. The material leaving the separating chamber is drawn into the lower fan housing, from which it is discharged through the discharge spout by means of the fanning action of the lower fan. All the material discharged from the mill is finished product and requires no subsequent screening. The current of air induced by the action of the lower or discharge fan passes over the pulverizing zone, and out through the screen surrounding the separating chamber, thus insuring cooler operation and maximum screening efficiency. This current of air keeps the screen perfectly clean and enables the mill to handle material containing a considerable amount of moisture without in any way affecting the

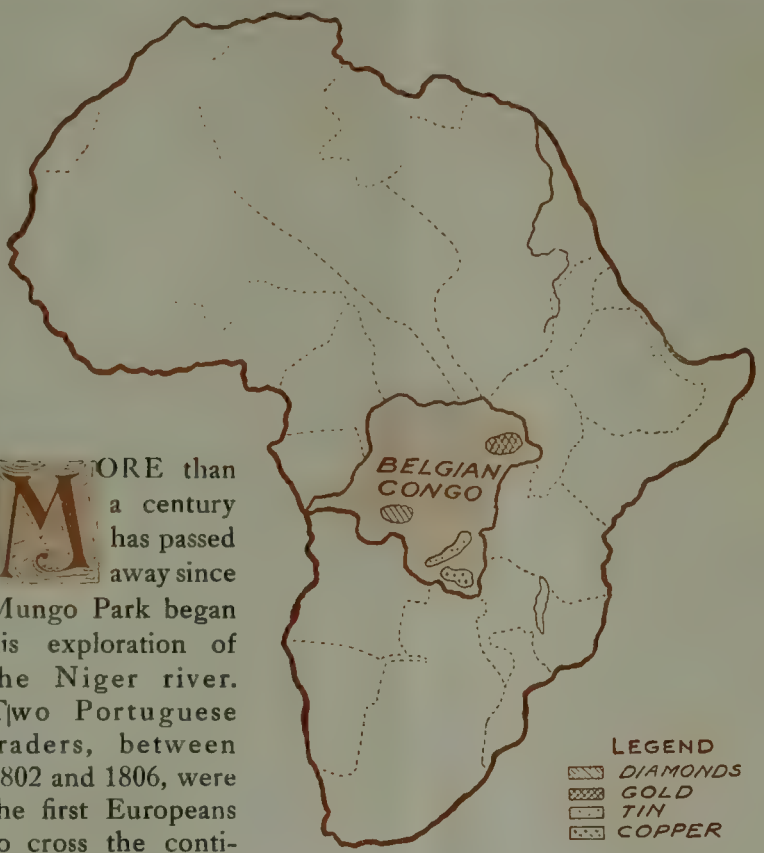
PART SECTION OF A FULLER-LEHIGH PULVERIZER MILL.

efficiency of the machine. When the mill is in operation, it is continually handling only a limited amount of material at any one time. As soon as the material is reduced to the desired fineness, it is lifted out of the pulverizing zone and discharged from the machine. It is therefore evident that, inasmuch as the crushing force is being applied to only a limited amount of material, the power required to operate the machine is reduced to a minimum and is furthermore applied directly to the material being pulverized.

The United States Steel Corporation and subsidiary companies have an extensive and highly educational exhibit at the Panama-Pacific Exposition. Among the subsidiaries are the National Tube Co., American Bridge Co., Universal Portland Cement Co., and Lorain Steel Co. The National Tube Co. is displaying samples of each phase of the welded tubular industry, including material which has been in service for a number of years, showing durability, resistance, and strength; samples of special types of joints; casing and boiler tubes which have been subjected to various tests; threading device; protective coated national pipe; 'Kewanee' products, including unions, brass, cast iron and malleable fittings, and a variety of other tube accessories and apparatus.

MINING PRESS

Volume 110 SAN FRANCISCO, MARCH 13, 1915 Number 11



MORE than a century has passed away since Mungo Park began his exploration of the Niger river. Two Portuguese traders, between 1802 and 1806, were the first Europeans to cross the continent of Africa. In 1816 the ill-fated expedition under Tuckey ascended the Congo for three hundred miles. Now the traveler may go by railway, in two and one-half days, to Lake Tanganyika, which Speke finally attained after years of effort, and only international rivalry serves to prevent the building of a railroad from the Cape of Good Hope to the Mediterranean. Africa, long the Dark Continent, is a treasure house of the future. In this issue Mr. Sydney Ball describes recent progress in Central Africa.

Problems of Labor—III 397

ARTICLES

LAKE SUPERIOR COPPER MINING: PRESENT AND FUTURE—IV.
By Thomas T. Read 398

Geographical situation, climate, and transportation facilities are all favorable to continued successful work in the Lake Superior copper region. The labor question is a highly important factor in operating costs. Conditions are actually favorable to the working man; such discontent as exists seems traceable to a less general feeling of democracy, which prevails throughout the district, as compared to other parts of the United States. Much has already been done to insure the welfare of the workingman, and this factor is of enough importance to justify careful scientific study.

MINING IN THE BELGIAN CONGO IN 1914.
By S. H. Ball and M. K. Shaler 403

The war in Europe has had marked effects on operations in the African possessions of European countries. Railroad building has been delayed, some roads already constructed have been destroyed. Copper ore is being mined in the Katanga district with steam-shovels. Three blast-furnaces are in operation and four more will soon be blown in. Coke ovens are in operation, producing 2500 to 3000 tons per day; the cost of producing copper is estimated at 10c. per pound. Go'd production in the Belgian Congo has reached nearly a million dollars per year; diamonds are being produced in considerable amount; tin mining offers much promise, but is little developed as yet. Some changes in the system of taxation have been made.

ANCIENT RIVER CHANNEL MINING IN CALIFORNIA.
By J. D. Hubbard 407

California gold mines have produced nearly one-seventh of the world's stock of gold. Much of this has come from ancient river channels, buried beneath flows of lava. Many areas remained to be worked, and development is hindered by owners who hold claims without doing any work other than the nominal amount required by law. Working costs are in some cases extremely low. Development is showing good results in several districts.

PRACTICAL RULES FOR CUTTING MINE TIMBER.
By Bernard Carr 409

Instructions for beginners are often productive of helpful ideas to experienced hands in other districts. The methods employed in framing timber in a Pennsylvania coal mine are here clearly and simply described.

UNDERGROUND HAULAGE IN THE BUNKER HILL & SULLIVAN MINE. *By J. W. Gwinn* 410

Electric locomotives haul 45,000 tons of ore per month through adits three miles in length. Both direct and alternating currents are used to operate storage-battery locomotives.

CANADIAN MINING INSTITUTE MEETING 411

The seventh annual meeting, held at Toronto, was interesting and well attended in spite of the depressing effects of the war. The stimulation of prospecting was the theme of animated discussion, and many papers of interest were read. New officers were elected.

REGULATIONS GOVERNING PLACER WORKING IN WESTERN CANADA 412

New regulations covering the location and working of placers in Saskatchewan, Alberta, Manitoba, and the North West Territories have recently been issued.

SCIENTIFIC study of the smelter-fume problem in the Salt Lake district is to be carried on under the joint auspices of the Bureau of Mines and the University of Utah, if a bill appropriating the necessary funds, which recently passed in the Utah State Senate, is finally approved, as is to be hoped.

MINE operators not members of the California Metal Producers Association should get in touch. The Association is not only making important savings for its members through co-operative buying of insurance and supplies, but is watching matters at Sacramento with a view to safeguarding against badly conceived and ill-informed legislation. This is work in which each should bear his part of the burden.

COPPER production in Germany during 1913 amounted to 90,400,000 pounds, while consumption aggregated 570,450,000 pounds, of which 87.5 per cent was imported from the United States, according to the statistics compiled by the Metallbank und Metallurgische Gesellschaft, of Frankfort, just issued. Austria's production in 1913 was 9,090,000 pounds and consumption 76,240,000 pounds, according to the same authority.

THE retirement of Mr. Charles A. Coffin from the presidency of the General Electric Company, which he has so long held, and the accession of Mr. E. Wilbur Rice, Jr., to that office was signalized last November by the presentation to those gentlemen of illuminated testimonials, executed at the Corpus Christi Monastery, at the instance of the Association of Edison Illuminating Companies. Through the courtesy of the General Electric Company, three-color reproductions of these have been sent to the many friends of those gentlemen. It is interesting to see that modern work in the illumination of manuscripts compares favorably with the best work of the middle ages.

READERS of the series of articles describing present conditions in the copper mining district of Lake Superior, which is concluded in this issue, can scarcely escape the conclusion that, far from being on the decline, this so well and favorably known district has just entered a new stage of its development; one which may lack some of the romance of earlier ventures, and which will certainly afford a less margin of profit on the amount of capital involved, but will be a larger and more important factor in the industrial life of its state and the nation as a whole. Mining is commonly regarded as a somewhat precarious industry, but the Michigan operators are making notable strides in stabilizing it.

CONGRESS has finally appropriated the money, $1,500,000, necessary for construction of the badly needed building at Washington for housing the United States Geological Survey, the Reclamation Service, and the Bureau of Mines. Although the building was authorized some time since, the money had never been made available. At the same time, $350,000 was appropriated for Bureau of Mines buildings at Pittsburgh with $57,000 for meeting the expense of removal. Other but minor increases were made in the funds allotted to the Geological Survey and the Bureau of Mines, which is all the more notable in that this year Congress was in little mood to increase the regular appropriations. Evidently the work of these great technical bureaus commends itself to the leaders in Congress, even if an occasional wind-producing statesman does seek transient fame by attacking them.

A LOCAL metallurgical society is to be established at Montreal, Mr. Alfred Stansfield, professor of metallurgy in McGill University, having taken the initiative, and some seventy metallurgists are supporting the movement. The amount of interest exhibited indicates a real need for such an organization, and it may be unhesitatingly said that any move that tends to bring about better acquaintance and closer co-operation among members of the mining profession is to be commended. But this is the age of centralization, and the founders of the new organization could not do better than make it a local branch of the Canadian Mining Institute, which already has thriving branches at Cobalt and in the Rocky Mountain region. Active and prosperous local branches are the best possible support for a national organization, and every means for furthering the excellent work already done by the Canadian Mining Institute should be heartily seconded by our colleagues across the boundary line, which delimits political divisions but happily does not divide professional interests. Elsewhere in this issue we present an account of the annual meeting of the Institute, held at Toronto last week, and of the keen interest exhibited in the proceedings in spite of the depressing influence of the war.

ZINC ORE AND SPELTER PRICES

Joplin producers have been protesting that they are not receiving their due share of the increase in the price of zinc. Specifically it is pointed out that in the same week that spelter rose in value $20 per ton, the price of ore fell $2. To the Joplin producer this seems impossible of explanation on any fair basis, though the matter is really very simple. The normal basis price for blende at Joplin of recent years has been about $40 to $41 per ton. Ore was selling at this price last October. It has since risen to $75, the highest price it has ever touched, and producers protest that on the old ratio of eight to one, it should sell at $80. There is some question as to how much metal, of 'Prime Western' grade, has been sold for 10 cents per pound. Our own average for the week ending March 3 was 9.05, but in times when the market is as uncertain and as excited as at present, it is not easy to get a true average quotation. It might well be supposed that an increase in price from $40 to $75 would be sufficiently satisfactory in itself. However, that is not a sufficient reason for a price of ore lower than the market really warrants, and the real problem is, what is a fair price for ore?

The difficulty lies in the fact that the metal market and the ore market are not the same. It takes a certain time to reduce the metal in the ore and to get it to the market. This period varies somewhat, but 60 days may perhaps be taken as a fair average. In buying ore, therefore, the smelter really pays what he judges the price of metal will be two months later. On the other hand, the quotation for metal is, unless otherwise stated, for spot delivery. It happens just now that the smelters do not believe the price of spelter will stay up long enough for them to treat the ore and get the metal to the market. Therefore they refuse to buy ore on the basis of the spot price of spelter.

The present high price for spelter is due to the withdrawal from the markets of the neutrals and the Allies of the metal made in Belgium, Germany, and Poland. A number of smelting plants have been put out of commission, and others can not ship to their customary markets. The big ore-producing districts, however, are not disturbed. The smelters that delivered to the markets now clamoring for metal, drew their supplies, in the main, from districts untouched by the war. In fact, the world has a surplus of zinc ore available and a shortage of metal. American zinc smelters happen also to have an excess smelting capacity, though not all of it is available to treat the foreign ores now cut off from their normal markets. It is, however, merely a matter of time until Australian ore comes to be smelted in the United States. How extensive the new trade will be, and how permanent, can not be foretold, but it is likely that it will be neither so extensive as feared at Joplin nor so permanent as hoped by the smelting companies. The big Broken Hill companies have been operating since the war began on about a 40 per cent basis, and that has only been possible because credits have been extended to them for storing concentrates. Since August negotiations have been under way for shipment of Australian ore to America, and as early as February 4 it was announced at Sydney that the Broken Hill Proprietary, Ltd., had contracted for delivery of 40,000 tons of concentrate to American works. Another company, having an annual output about equal to that of the Butte & Superior, has a representative in the United States now, negotiating contracts for sale of ore. Still a third big company at Broken Hill happens to have one of its directors in the United States and is carefully considering the possibilities of the situation. Negotiations are also under way for shipment here of ore from other foreign countries that previously delivered to German furnaces. Evidently the smelting companies believe this ore will be available before their own bins are empty, and they should be in a position to know. Certainly the present prices for ore can not hold, and no one would be justified in stocking up just now. The foreign ore seems certain to come to America, and at the present high prices, or even at prices materially lower, it can compete effectively. At $40 per ton for Joplin ore, Australian concentrates have been sold to better advantage abroad, though even here there is possibly a question. In 1911, in examining the possibilities of marketing zinc ore from California, it was found that better returns could be obtained in the Mississippi Valley, with a freight rate of $10 per ton, than from European smelters even on the basis of a possible rate of $3 per ton to Antwerp. Actually the freight rate to Europe even then was more, and now is much higher. It is a question whether the smelters in the United States have not been too ready to assume that they could not compete on an equal basis with those in Europe, and if the instance quoted be any guide, American ore producers have certainly received better prices from zinc smelters than Australians have from those in Europe. So good an authority as Mr. Ferdinand Heberlein has stated that American zinc-smelting costs are lower than in Germany, and it is entirely possible that the United States may become, just as in the case of copper, an important smelter of foreign ores.

This is not likely, in our judgment, to depress prices at Joplin seriously, either now or later. There will always be the matter of freight rates to consider, and the quality of Joplin ore is such as to give it an advantage. The smaller plant necessary to produce a given quantity of spelter working on Joplin ore, the docility of the ore itself, the free market for purchase, and the possibility of maintaining a steady supply of uniform grade, will always work to the advantage of the Joplin producer. In addition, there are just now the further advantages that few American zinc smelters have either the plant or the experience necessary for most economical handling of Broken Hill ore.

The high price of both spelter and ore is temporary, and experience indicates that it will bring in its wake a period of depression and loss, but, taking the long time view, we are optimists as to zinc. The world's con-

sumption is now about 1,000,000 metric tons per year. Ten years ago it was 600,000, but the curve tends steadily to become steeper, in other words, the world is finding new uses for the metal. Estimating on the basis of past increase in demand, the present production must increase from 60 to 100 per cent in the next ten years. It does not seem probable that this will take place, but even a much smaller increase will make heavy demands upon known sources of supply. Zinc is one of the metals the ores of which are frequently not recognized, so that discovery of new districts is probable, in addition to which there is the fact that higher prices and improved technology will bring into the market material now of too low grade to be worked. All in all, zinc producers have every reason for being cheerful.

PROBLEMS OF LABOR—III

From time to time we have reproduced in our columns expressions of opinions on labor problems to show the trend of contemporary thought. Elsewhere in this issue, Mr. Thomas T. Read, in concluding his series of articles reviewing present conditions in the Lake Superior copper mining district, discusses some aspects of the labor problem which seemed to him of importance in that district. As our readers know, the Federal Commission on Industrial Unrest has held sessions throughout this country in an endeavor to draw out the best contemporary thought on the many and perplexing problems concerning employees to which our complex social organization has given rise. Next week we hope to be able to find space for a list of the causes of industrial discontent that have been brought to the Commission's attention. Meanwhile, the following summary from the report of the Commission is worth reproducing:

"Great as is the task of studying the problems reviewed in this report, they do not exhaust the duties which we feel have been placed upon us, for underlying all industrial unrest and discontent there are fundamental causes, which, if ignored in any recommendations which we submit, would make our proposals useless and hopeless. Statesmen, economists, sociologists, employers, and workers have been concerned with certain of these underlying causes ever since the industrial reorganization brought us more or less permanently employing and wage-earning classes.

"The experience of these men and women, and their theories as well as the facts, must be studied in order to gain an adequate conception of the causes and effects of such fundamental phenomena of modern economic life, as the changing distribution of wealth, the world-wide rise in prices and the cost of living, the movement of population from rural to urban centres, the ever-increasing invention of labor-saving machinery, the discovery of new industrial processes, the almost rhythmical recurrence of prosperity and depression, the development of great industrial and financial corporations, and the increasing influence of the working class.

"What is the meaning of the organized array of employers and workers? Is it a temporary phenomenon, an accidental growth, or does it have its roots in the needs of modern economic life? Must we foster the growth of such organizations in order to insure equal protection of the law, a just distribution of the product of industry, improved American standards of living, and an equitable division of the benefits and the burdens of government and taxation?

"Or must we, as some suggest, look to the gradual decline of these organizations and to the development of new agencies for maintaining peace and friendly relations between employers and employees, and justice and prosperity to all classes of our people? Again, do these unions and employers' associations mean a constant and ever growing industrial war? Are we to have increasing class conflicts, or is the organization of labor and capital to be our armament for insuring industrial peace?"

In considering the weighty problems set forth above it is well to keep always in mind that discontent does not argue perversity. There are those, indeed, who believe that discontent with things as they are is the first essential to mental and spiritual growth, as the phrase 'divine discontent' connotes. To our way of thinking, the problems here presented are only one phase of the struggle for personal liberty in which all mankind has been engaged for centuries. It is easy and simple to secure complete personal liberty, all that is necessary is for men to live alone and completely out of contact with fellow human beings. But none of us are willing to secure personal liberty in that way, for we desire the many and great advantages which can be derived from living together. The whole tendency of modern civilization is toward closer association and greater dependence upon each other. And when one man depends upon another the liberty of the one at once comes into conflict with the other. The personal liberty of a locomotive engineer may impel him to go fishing instead of going to work on a spring day, but if he does not show up at the roundhouse to take his train out on time, hundreds of people may be prevented from reaching their offices on time and perhaps may lose a good deal in their business. An employer's personal liberty would cause him to shut down his plant and dismiss his force just as soon as his business fails to show a profit, but he has to consider the effect such an action would have on those who are dependent on him. The vital problem, therefore, is to secure the fullest possible measure of liberty for each without unduly restricting the liberty of others. This will never be completely attained, for each new development of civilization introduces fresh problems of adjustment. We believe that most men are disposed to be kind and considerate so far as they can be without injury to their own interests. We cannot subscribe to that biological theory of civilization which assumes that the weak are necessarily the victims of the strong, and are confident that the theory which asserts that the best interests of any individual can only be attained through fair dealing with others is the one that will ultimately prevail.

Lake Superior Copper Mining: Present and Future—IV

By THOMAS T. READ

In the preceding articles* of this series I have briefly considered how the character of the Michigan copper deposits, the methods of exploration and mining now employed, and present tendencies in milling and metallurgical practice are likely to affect the rate of evolution of that district into one of large-scale, low-cost copper production. It now remains to conclude the analysis by an equally brief discussion of the general working conditions obtaining in the district.

General Conditions

The geographical position of the district deserves at least a moment's consideration. Lying at about 47° north latitude, it is, compared to European latitudes, much farther south than Paris, but its position in the land mass of the North American continent gives to it a more rigorous and variable climate. Its isothermal in winter passes through Norway and Sweden, and in summer through Northern Africa. The region is one of heavy snowfall, and its annual rainfall is 30 to 40 inches per year, or much the same as that of Wisconsin, Illinois, Iowa, and eastern Kansas. The significance of these remarks may not be evident, but it must not be forgotten that an industrial region needs an abundant food supply. The climate just indicated is not especially well adapted for that. Cattle-growing can only be successfully practised in such a region when human labor is abundant and cheap in order to put up hay and feed the cattle during the winter, and labor is not now nor ever likely to be abundant and cheap in this region. The growing season is too short for such crops as corn to reach maturity, but potatoes, other vegetables, and many fruits do well. A hundred years ago the region was thickly covered with conifers and hardwood forest trees. Most of this forest has now been cut, but comparatively little progress has yet been made toward clearing away the undergrowth and draining the land to fit it for agriculture, and beyond a few Finns almost none of the settlers in the region have directed their energies toward tilling the ground. There can be little doubt that almost the whole region would yield abundantly if planted to suitable crops. The situation is one of simple economics, and as long as immigrants to the region can find work which yields them more immediate and greater returns, agriculture is not likely to flourish. The continued prosperity of the mining industry of the region depends in large measure upon an abundant supply of labor at a reasonable wage, and this supply in turn depends on an abundant supply of food at a reasonable cost. It would seem the part of wisdom for the local commercial organizations, such as the Copper Country Commercial Club, to devote much attention toward encouraging agriculture in this region as the best means of protecting themselves against the increasing cost of food, which has been characteristic of the whole United States during recent years.

Another unfavorable feature of the economic situation is the fact that mining and its allied industries furnish almost the only means of livelihood in the district. The best class of employees are men with families, but such men are at a disadvantage in a district where such a condition exists. A rate of wage which furnishes an ample income for a single man is quite a different matter to the man who has a family of six or eight to support. In most industrial regions the greater needs of the large families are met by the contributions which the boys and unmarried girls are able to make toward the family income. The children of such families usually finish their schooling by the age of fourteen and contribute to the family income for several years before marrying and setting up family groups of their own. The laws of the state of Michigan forbid the employment of boys under eighteen in mining and smelting industries, while there is practically no employment open to girls of any age, other than domestic service. Unless the situation can be met, the class of labor available in the district will inevitably tend to deteriorate through the moving away of the better class of families to regions where the youthful members of the family can find employment and help to maintain a high standard of living; and with this deterioration will come labor troubles, from which the district was remarkably free until the outbreak of 1913. It would seem well worth while, therefore, to encourage the development of industries that afford employment for boys and young women.

The fresh, clear, and cold waters of Lake Michigan furnish an abundant water supply for the region. While the rainfall is ample, the 'hummock and basin' topography characteristic of a glaciated region is not favorable to the development of water-power. This is not of great importance, since the comparatively low cost at which coal can be laid down in the district permits the generation of steam and electric power at reasonable rates. Lumber is increasing in cost each year, as the forests of northern Michigan have largely been cut; but, as indicated in the preceding articles, comparatively little timber is used in mining, and it is only as it affects the cost of building construction that this feature is of much importance. Portland cement can be laid down in the district at a reasonable cost, and mining and milling operations furnish an abundant supply of rock and sand, so that the increased use of concrete is likely to counteract any tendency toward increase in construction costs, other than that resulting from the constantly rising cost of labor. And, as I have endeav-

*December 5, 1914, p. 871; February 6, 1915, p. 209; February 20, p. 284.

ored to emphasize throughout, the chief aim of progress in this district must be the reducing of the necessity for labor to a minimum.

Transportation facilities are excellent throughout the district. The Chicago, Milwaukee & St. Paul, the Northwestern, and the Duluth, South Shore & Atlantic railroads run trains into the district, while the Copper Range railroad maintains an excellent local service over its lines. The Calumet & Hecla, Quincy, and other mining companies operate their own railroads to connect mines, mills, and smelters, and the convenience of passengers is served by the trolley line connecting Calumet and Houghton. North of Calumet the Keeweenaw Central railroad maintains a desultory service to the formerly prosperous communities of the northern end of the peninsula. The roads are generally good, automobiles are abundant, and can be operated during eight months of the year. During the months in which navigation on the Great Lakes is open, the Pennsylvania railroad maintains an excellent steamer service between Buffalo and Duluth, stopping at Houghton in both directions, while cargo boats are frequent. Rates for incom-

QUINCY SHAFT-HOUSE No. 6.

ing freight are especially low, as the boats which carry iron ore to the Lake Erie ports are generally obliged to return empty, and are consequently willing to carry freight for little more than the cost of putting it into and taking it out of the boat. This makes the cost of fuel very low and also insures that supplies of all kinds will always be available at prices not much above the Chicago, Cleveland, or Buffalo level. Without going further into detail, the generalization may be made that in cost of supplies, transportation, and other material things the district is at least on a par and generally at an advantage as compared to most mining districts. Nor does there seem any reason to expect any change in this regard; the district will doubtless maintain its favorable position. The problem of decrease in operating costs, outlined in the preceding articles, will not therefore be complicated by changes in the relative position as compared to other districts. Labor cost and its probable effect on operating cost is more of a problem, which merits discussion at some length.

It has been emphasized in the preceding articles that present and future progress in this district must tend toward operations on a larger scale and at a lower cost. The cost of labor is quite certain to increase continually; therefore the only way to lessen the labor-cost factor in operating costs is to decrease the amount of labor required. This may be done in two ways: by replacing manual labor by machinery wherever possible, and by rendering the labor more efficient. Some of the ways in which this is being done have already been indicated. In general, the much-discussed 'efficiency'

QUINCY SHAFT-HOUSE No. 2.

methods of the day can be here applied to good advantage. But the labor problems of today are not a mere matter of motion study, hours of labor, and rates of pay; they are vastly more complex. In order to bring out the points I desire to make, it will be necessary to diverge somewhat, and discuss the question in a wider aspect. During the more than half century in which mining has been carried on in this district there has been almost no trouble between employees and employers. In the summer of 1913 a general strike of the mine workers of the district was called by the Western Federation of Miners, and in the succeeding months the violence displayed by the striking workmen in their attempt to prevent the operations of the mines reached

OSCEOLA SHAFT-HOUSE No. 5.

such a pitch that the governor of Michigan was obliged to call out the militia. This and a skillful publicity campaign by organized labor forces made the strike a focus of national interest. It was discussed extensively in the public press, the Department of Labor at Washington attempted to intervene on behalf of the strikers, without regard to whether such intervention was really justified, and a committee of Congress seized the oppor-

tunity for a display of 'grandstand' politics by conducting an investigation that was productive of no important result. The general features of the strike are too well known to mining men to need discussion. It was fomented by the Western Federation of Miners in an endeavor to regain the ground it had lost by defeat in the Utah Copper-Nevada Consolidated strike and the Homestake strike, and it was lost because public opinion justified the refusal of the operators to have any dealings with an organization of the character of the Western Federation. Some of the 'demands' of the strikers were for changes which the companies were glad to make; such as the eight-hour shift, by which the companies secure a full working day on Saturday instead of the former half day in which little real work was done. The protest of the strikers against the introduction of the light drill had so little justification in common sense that it could not be maintained. When the strike was called off, both operators and miners had gained something by the shake-up, which permitted a readjustment of conditions, and both had, of course, lost heavily during the period of the strike. There has been enough discussion of the rights and wrongs of both sides, much of it prejudiced in favor of the employees; it is not my purpose to add to it here, but to try rather, so far as possible, to examine into the fundamental forces involved, ignoring details.

When a fire breaks out in a warehouse it is usually because inflammable materials have been left lying about that, either from spontaneous combustion or through bringing fire in contact with them, have been set alight. In this case there was no spontaneous combustion—it was a case of arson in which the Western Federation of Miners was the incendiary. What concerns us in this review of the district is that the inflammable material was lying about. In other words, it seems clear that no such violent outbreak could possibly have been produced unless discontent had already been at least latent in the district. What grounds for discontent were there? The miners worked only 45 hours per week, as compared with the much longer hours of labor in other mining districts. The wages of miners averaged $3.20 per shift and of trammers $2.63 per shift, according to the report made by the committee of the Copper Country Commercial Club, which undertook thoroughly to study the existing conditions. Houses can be rented for $1 per room per month, usually with free water service; lots 50 by 100 ft. can in some cases be rented for as little as $1 per year, and average $5 per year ground rent in case the miner wishes to build his own house. The cost of food is only 75% of the cost at Butte, Montana, according to the same report, and the committee estimated that an average miner's family in Butte would require $23 per month more income in order to be on a par with the same family in this district, or more than the average wage difference between the two places. The Calumet & Hecla, which with its subsidiaries, employs nearly one-half the men of the district, has for years maintained an employees' aid fund, and when the Michigan workmen's compensation law went into effect in 1912 the Company was thereby required to do less than it had previously done voluntarily. Employees of the Calumet & Hecla who are over 60 years of age and have been in its employ over 20 years are retired on a pension. Employees of the Company pay 8c. per kilowatt-hour for electricity, as compared with a rate of 12c. charged the general public by the private company which supplies the town. Free pasture is given each employee for one cow, free fuel is supplied needy persons. A public library is maintained by the Company, also a bath-house which is practically free, as the fee charged merely covers the cost of washing the towels. The Calumet & Hecla built and equipped an armory for the state militia, has built and equipped ten schoolhouses, a high school, and a normal training school, and rents these to the state or county on the basis of 3% of the cost. The Company gave a free site for the Y. M. C. A. building, free sites for several churches, and has given them over $35,000 in cash. The Company has organized a band and also a baseball team, the members of which receive their regular wages for the time spent in playing. I might extend the list further, but enough has been said to indicate what the general tone of the district has been; for the other companies have followed the lead of the Calumet & Hecla, so far as their means have permitted. The practice of the Calumet & Hecla has been so far from treating its employees unjustly that, as a matter of fact, the efficiency of that organization apparently suffers a good deal because it has never been the policy of the company to weed out old employees who are no longer efficient workers. The records of the Company show that 111 of its present employees entered its employ over 40 years ago, and some 400 have been working for it over 30 years. These are not mere pensioners, but men who are carried on the payrolls at the highest rate of wage or salary they have attained, and who retain their full degree of authority. Although they do not generally realize it, old employees are usually the greatest obstacles to efficient work in an industrial organization, and if the management of the Calumet & Hecla had really exhibited any of the disregard of the rights of the laboring man which has been so commonly attributed to it, it would long ago have replaced its old employees by younger and more active men.

Why should employees in a district where such conditions prevail be discontented? My personal opinion as to the explanation can easiest be made clear by an allegory. There were once two brothers; one was ambitious, worked his way through law school, went to the city, and was fortunate enough to become counsel for a new enterprise that in the course of a few years developed into a $60,000,000 corporation that paid him a salary of $50,000 per year. The other brother, having less initiative and less aptitude for study, remained on the home farm and at the end of the same period was working as hard as ever for a bare living. The lawyer, out of the goodness of his heart, made liberal presents to his brother at holiday time, paid the cost of his children's schooling, and gave to him all the dis-

carded clothing which was not smart enough for his own wear, but amply good enough for the more modest needs of his brother. From time to time the farmer visited his brother and was received with great cordiality, but could not fail to notice that during the period of his stay none of the members of the smart set to which his brother belonged were invited to the house; also that when his brother took him to some of his expensive clubs he spoke to many acquaintances but did not introduce the farmer to any. The farmer found indeed that he and his brother were no longer very congenial companions, he had little familiarity with and interest in the things which filled his brother's life, and the same was apparently true of his brother. It might be supposed that he was filled to overflowing with gratitude to his brother for all that he gave him, but strange-

C. & H. REGRINDING MILL No. 2.

ly enough that was not the case. He took the things that were sent him with no thought but that they were little enough for one to give who had so much, and he hated his brother because he believed his brother did not think him 'good enough' to mingle with his friends. In short, he resented the apparent inequality between them; and his brother's generosity, instead of creating good feeling between them, only increased the resentment because it was tangible evidence of the inequality.

During recent years various individuals and organizations have instituted more or less profound investigations into the fundamental causes of labor unrest, usually with the net result of the official recording of a great variety of discrepant testimony, so overwhelming in amount and bewildering in variety that no general conclusions can be drawn from it except that nearly everyone seems to be dissatisfied with things as they are. Without any such profound basis to go upon, I dare venture my opinion that such a condition as in the allegory is *a* fundamental cause, if not *the* fundamental cause of discontent among laboring men. Various people attribute such discontent to the inequality of the wages paid to the employee and the profits made by the employer. I do not believe this has anything like the importance commonly attached to it. The laboring man is no fool and is keen to recognize that wages should vary in proportion to the responsibility involved; the laborer at $3 per day has no objection to his foreman being paid $5 per day. Nor does the employee of, say, a subway contractor object to his employer making $25,000 on a contract in a year, because he can himself see how his employer, with less skillful management or a little bad luck, might have lost money, instead of

OSCEOLA-CENTENNIAL MILL.

making it. It is only when operations become more involved, when a large corporation is the employer, that these personal relations become obscured, and the laborer begins to think he is being injured by being paid only $3 per day while the corporation is paying large dividends to stockholders who never give a moment's attention to the work from whence their profits are derived.

ELECTROLYTIC REFINERY AT HUBBELL.

There is no real injury involved, just as the farmer in our allegory was not injured but rather benefited by his brother toward whom he felt a sense of injury and resentment. The real trouble is the apparent lack of equality. The farmer knew that his lawyer brother was his equal, they used to sleep in the same bed, and the laborer knows that the directors and the stockholders are his equals, for does not the Declaration of Independence say that it is a self-evident truth that all men are created equal? The farmer resented the fact that he was not welcome in the society in which his brother moved; the laborer resents the fact that the director of the company for which he works belongs to exclusive

clubs of which he could not pass the doors, and dines at expensive hotels where he would not be served because he does not wear the proper kind of a coat. A great many other conditions are involved in the present complex relations between employer and employee, and it is hard to determine which are of real importance and which only superficial. But I am firmly of the belief that the present social unrest is primarily due to the fact that men who believe that they are, and of right ought to be, the equals of other men, see that they are not equal and are without the means of establishing their equality. There are thinkers who hold the view that men are not and never can be equal, but with the further discussion of the topic we have nothing more to do here, having developed the point that the ideals of democracy generally held in this country are a source of discontent; because present conditions are so far from attaining these ideals.

The forces indicated act with more than ordinary power in the Lake Superior district, I believe, for at the end of a recent visit of a month to this region, I came away with the feeling that life there, in spite of its many and obvious advantages, was less democratic than in any other district of the western United States. The general tone of a district can often be traced to some strong personality; just as the personality of Queen Victoria imparted to the national life of England much of her qualities. No doubt the life of this region still retains much of the influence of the personality of Alexander Agassiz. That remarkably brilliant man gave much personal attention to the direction of the Calumet & Hecla, which exerts a dominant influence in the district. I, of course, never knew Alexander Agassiz, but I am told that he was a natural born aristocrat, and certainly the great number of honors and decorations which were conferred on him must have tended to make him less democratic in his viewpoint. If so, his spirit still lives. One day I happened to pass by one of the shafts just as the men came up at the end of the day shift. The shift boss stopped to speak with the topman and stood leaning on the bar which is used to close the doorway of the shaft-house, gazing out over the landscape, as I passed by. In a somewhat extended experience with hotel clerks and other supercilious persons, I have never seen a more marked expression of haughty disdain than the countenance of that shift boss bore. The incident may seem a trivial one, and yet it is generally through trivial remarks and actions that underlying impulses and beliefs are revealed. I do not mean to intimate that the people of the district are conscious of a lack of democracy: most people do not know what is the matter with them or their daily life any more than an ill person knows what ails him; they merely know they are dissatisfied, and even if they recognize certain symptoms, they rarely perceive the cause of them. Without claiming any profound knowledge or insight, I venture to state my belief that the cause of the unrest in this district, where conditions are in many respects so favorable, is a lack of real democracy, which had its beginnings in the relations of master and man, and has spread through the life of the whole community.

If the foregoing is true, then it may be expected that the discontent in the district will become greater as time goes on, unless something is done to diminish it. Two means of meeting this situation are possible. One is to gradually replace the present workers of the district with fresh arrivals from Europe and men who have gained their experience along the Atlantic seaboard where conditions are generally less democratic than west of the Alleghanies. Such a method is like robbing Peter to pay Paul. Men of this character are less efficient and more apt to become the disciples of professional agitators. Indeed, in many respects the labor situation in New York and the nearby industrial cities presents more critical problems than anywhere else in this country. Such a course of action would lead out of the frying pan into the fire. The other method, and the only one that will produce permanently satisfactory results, is to endeavor to remold the life of the community along more democratic lines. How this should be done only one versed in such problems could say. In my opinion the problem is one that is of enough importance in its potential effect on future operations to warrant its receiving the same kind of expert study which is being devoted to the perfecting of mining and metallurgical operations.

One even more elusive factor remains to be considered, namely politics. Legislation in the United States is the outgrowth of politics, and politics in this country, unfortunately, does not engage the energies of the best type of citizen. Much of the legislation that is initiated is either unnecessary or unwise, some of it is actually harmful. Whenever legislatures are in session no industrial organization is safe from the possibility of laws which hamper its operation without producing a corresponding amount of benefit to the state. As an example of such legislation, the proposal to tax the ore reserves of the mines in Michigan may be cited. The true benefit of the state lies in having the mines operated in such a way that their operations will be as stable as possible, and therefore afford employment to as large a body of citizens as possible. When the question of raising additional revenue through taxation arises, such fundamental factors as this should be given due consideration, so that mining properties shall not bear an undue proportion of the burden. Fortunately the mines in the region are not threatened at any vital point, such as the campaign against smelter fume which has proved so troublesome to mining operations in some western states. So far as can be foreseen, politics does not seem likely to be, in a large way, an important factor in the economic future of the district. The general subject of politics in relation to mining operations is too indefinite, however. I cannot close without expressing my indebtedness to the engineers of the district who afforded me many courtesies and facilities, but especially to Messrs. James MacNaughton, Charles L. Lawton, F. W. Denton, and the members of their staffs, and to my friend, Mr. Alton L. Dickerman.

Mining in the Belgian Congo in 1914

By S. H. BALL and M. K. SHALER

*Notwithstanding the unfortunate condition of the mother country, the mineral production of the Belgian Congo appears to have increased, the gross production for 1914 being about $3,850,000, as opposed to that of some $3,000,000 in 1913. This results from enlarged productions of copper in Katanga and diamonds in the Kasai region, and a slight increase in the gold output.

One of the remarkable features of the war is the world-wide character of the fighting. Upon news of the outbreak of war in August, Belgian Congo troops using a converted 'cruiser,' the river boat *Luxemburg*, began

operating with the French columns against the Germans in the Kamerun. Fighting has also taken place between Belgian and German forces at Kisseni (at the frontier near Lake Kivu) and on the extreme southeastern boundary of the colony. Naturally, however, the future status of the map of Africa will be decided by the outcome of the war in Europe, and only an indecisive result will obviate the change of proprietorship of many African colonies.

Africa more than any other of the continents is dependent upon Europe for development, and in consequence is, next to Europe, most affected by the war. The war will so thin the ranks of young Europeans that African possessions will be less needful to absorb the surplus. The home governments had decided to spend for railroads and transportational improvements in the colonies of Belgian Congo, Angola, Portuguese East Africa, French Equatorial Africa, British East Africa, German East Africa, German Southwest Africa, and the Kamerun, during the next ten years, between $100,000,000 and $200,000,000. Hereafter when peace is declared, the needs of each of the home countries for setting its own house in order will be such that presumably but little of this money will be available.

The map shows the present status of railroad construction in Africa, with the proposed extensions and new lines decided on. As the development of colonies, and particularly mining progress, is largely dependent upon the betterment of lines of communication, the delay in the railroad building program is particularly unfortunate. Not only is railroad building delayed, but unfortunately in the military operations, some of the railroads have been partly destroyed. The advantage of rail transport is well illustrated by the fact that a traveler can now reach Lake Tanganyika by the Dar-el-Salaam-Kigoma railroad, in from 50 to 60 hours, a journey once requiring by caravan route many laborious months. Were the times peaceful, this road would give Germany commercial control of a narrow strip of Congo territory on the west shore of Lake Tanganyika, and would presumably further the development of certain mineral deposits in the north Katanga.

In July the Belgian Congo was linked with Ostend by direct cable, thus reducing notably not only the time of transmission, but also the cost. During the year the use of fuel oil on river steamers and railroad engines became more general. Satisfactory progress is reported in wireless construction, and in river transport. Some one hundred miles of railroad was completed in 1914, and at present the Belgian Congo has well over 1000 miles of railroad. Prior to the war the colony's proved richness in copper, diamonds, gold, rubber, palm oil, copal, and other resources was sufficient to warrant a much more comprehensive campaign of railroad building, which would have resulted doubtless in a profitable development of other resources scarcely now thought of.

Copper

The Union Miniére du Haut Katanga, operating copper mines in the southeastern part of the colony, from January 1 to June 30, had produced some 4500 tons of copper ingots. In August orders curtailing the output somewhat were sent from Brussels, but notwithstanding this, the year's production was approximately 10,700 tons, making it one of the 25 largest copper producing companies.

The production of copper by this Company has been as follows:

	Tons.		Tons.
1911	786	1913	7,245
1912	2,460	1914	10,700

The Star of the Congo mine, situated nine miles from the Lubumbashi smelter, produced in 1913, after sorting and washing, 50,000 tons of ore. The mine has been worked for some three years as an open-cut with hand labor. Most of the ore is soft, but the fluxing dolomitic ore is broken up with 3¼-in. Ingersoll drills. Whites, employing gangs of negroes, contract some of the work; about 60 whites and 800 blacks are employed. The ore is now milled through to a haulage level from which the loaded cars are drawn to the adit mouth by cable. The coarse ore is dumped directly into railroad cars, the rest is washed, the coarser being then loaded, the rich middling briquetted, and the 'fines' stored for future treatment. Talcose ores are treated in a special washing plant. Since January 1914, two small Bucyrus steam-shovels have, in addition, been stripping overburden and mining soft ore. The buckets are one-half cubic yard and the shovels have a capacity of 200 tons per ten hours.

At the Kambove mine, opened in June 1913, there was produced, after sorting in the last six months of that year, over 11,000 tons of ore. Two steam-shovels, one a 48-ton Bucyrus, and the other a Koppel of 49 tons, each with dipper of 1½ cu. yd. capacity, have been shipped and were to have been ready to work early in 1915. Each has a rated capacity of from 500 to 600 tons per ten hours. The mine is now worked by a main underground haulage-way to which the ore from the surface is shot down chutes. From this the ore is trammed by natives to a loading station, where the hard and soft ore is loaded direct into cars, the slightly cupriferous quartzite, on the other hand, being set aside for later treatment. The ore is sent by railroad to the smelter, where the soft is briquetted. About 30 white men and 400 negroes are employed.

Mining at the Luishia mine was retarded in 1913 by the inadequate labor supply, but nevertheless some 20,000 tons of ore was produced. As it is a powdery ore containing considerable cobalt and iron, the greater portion is briquetted. As the labor supply permitted, development was carried on at several of the mines, the next one to be opened presumably being the Likasie.

As noted above, much of the ore is soft, and to render this a satisfactory furnace product it is briquetted at Lubumbashi. The ore is compressed in a plant consisting of six presses, with a capacity of 250 tons per 20 hours, the pressure being six tons to the cubic inch. The cylindrical briquettes, which contain no binder, are about 6 in. long and of 4-in. diameter. Concentration

of the other ores now consists principally of hand-sorting, although some ores are screened and washed, and the talcose ore is treated in log-washers. A 50-ton mill is en route to Africa, and will be used for mill tests. A third water-jacket furnace was blown in on June 27, and in midsummer the three furnaces were simultaneously in operation, giving a daily production of about 48 tons of ingots, containing from 96 to 97% copper. It was expected prior to the war that four more would be

runs 15 years. The coke price is satisfactory, and low freight rates have been obtained from the Rhodesian railroads. The copper company engages to take at least 100,000 tons of fuel (at least 40,000 tons of coke, and not over 60,000 tons of coal) per year. The Wankie coal contains about 15% ash and 2% sulphur, and is washed to 10% ash and 3½% sulphur. The coke recovery is reported to be about 70% and contains 15% ash and about 1% sulphur. Clay and refractory bricks are also ob-

MAP OF THE BELGIAN CONGO.

blown in during 1915, and the two now *en route* and at Beira will presumably soon be erected.

The second battery of 22 Coppée coke ovens was completed in March 1914, and now from 3000 to 3500 tons of coke are made from Wankie (Rhodesia) coal. The waste gases are used to heat two Stirling boilers. As a little under three tons of coke is used per ton of copper produced, it is evident that these furnaces are sufficient for the present production, although the Company also obtains coke from Wankie. A contract made early in the spring of 1914, intended to cover fuel necessary to feed further smelting units, dates from July 1, 1915, and

tained at Wankie. Jean Jadot, chairman of the board, states that the cost for 1914 would be about 9.6c. per pound, delivered at Antwerp, plus approximately 0.4c. for general expenses in Europe. This price of 10c., of which 6.7c. is for mining and smelting, does not include debenture or amortization charges.

The labor situation is much less critical than a year ago, as late in 1913 a contract was entered into with the Nyasa Consolidated Co. to supply Nyasa natives, and natives are also being obtained from Portuguese West Africa. As early as May 1914, over 600 Nyasa natives had arrived. The supply for the moment at least ap-

pears adequate, although the Congo itself cannot supply the needed labor for its own future development. P. K. Horner is general manager in Africa, and A. E. Wheeler consulting engineer. A number of other American engineers, including Messrs. Snow, Kehen, and Johnston, are in the employ of the Company in Africa.

Gold

But few reports are at hand on account of the war, as to progress at the placers in the northeast part of the colony—Kilo, Moto, Babeyru, and Kanwa. The production for 1914 should, however, be about $900,000.

In February and March 250,000 gold 20-franc pieces were coined at Brussels from Congo gold. The colonial authorities at that time showed a disposition to reserve the right to purchase all gold produced in the colony, and in the decree granting the Kasai company the right to prospect in certain parts of the Aruwimi watershed, and in the new draft of the mining laws of the Katanga, is a clause giving preference to the colony and the Belgian government as buyers of gold.

Diamonds

During the year the Kasai diamond fields' production was satisfactory. More diamonds were recovered from the gold placers in the northeast part of the colony, some fifty stones being found.

The Kundelunga-Lualaba Exploitation Co., with 13 white and 250 black employees, continued on a large scale the washing of the 'yellow' ground of its pipes. Robert Williams reports that in 1913 at Luanza 4390 loads were washed, producing 218 small diamonds, the largest weighing three carats. From the commencement of work in 1911 to December 31, 1913, a total of 9315 loads yielded 369 diamonds, weighing 187 carats. This is an average of about 0.02 carat per load. The Société Belge Industrielle et Miniére du Katanga in March 1914, sent a number of engineers to test its kimberlite pipes in the same region, some seventeen in number. The discovery of several more supposed pipes was made in 1914.

Tin

Tin mining apparently advanced but little during the year. The Union Miniére du Haut Katanga did nothing at Busanga beyond a small amount of testing, but now that the railroad is opposite the mine, distant some 38 miles, work would have been pushed were it not for the war. The Société Belge Industrielle et Miniére du Katanga's operations at Muika were considerably embarrassed, since, on account of the exceptionally low water in the Luvua river, new machinery did not reach the mine. Early in 1914 it produced about ten tons of concentrate per month with its 5-stamp mill. The force consists of 11 Europeans and 450 blacks.

Miscellaneous

Up to May 15, 1914, 510 mining claims had been staked in the Katanga, of which approximately 400 are for copper, those for tin being second in number. Some seventy-four of the earliest claims staked have been extended for two years, the first period of four years given for development having elapsed. The principal exclusive prospecting rights in the Katanga, all held by large companies, have been extended to April 15, 1915, at which date it is hoped that the new mining law now before the King will become effective. This draft of the Katanga mining law, applicable only to mines in the southeastern part of the colony, changes certain of the more unfavorable articles digested in one of the earlier numbers of this review. The chief changes follow: Ten years instead of six are permitted to develop a claim into a mine; the old royalty of 1% upon the gross production (5% in the case of precious stones and precious metals) due the Special Committee of the Katanga (in reality the colony) is suppressed, and instead of receiving 33% of the profits, the colony participates in the profits on a sliding scale, according to the success attendant upon mining. This rather interesting form of taxation will be understood from the following table:

Profits in francs on 100 francs.	Former law, 1910.	Proposed law. Diamonds and precious stones.	Proposed law. Other minerals.
5	1.65	0.60	0.60
7	2.41	0.84	0.84
10	3.30	1.44	1.44
15	4.95	2.69	2.69
20	6.60	4.69	4.69
25	8.25	6.69	6.69
30	9.90	8.69	8.69
35	11.55	10.69	10.69
40	13.20	13.69	13.19
50	16.50	19.69	18.19
60	19.80	25.69	23.19
80	26.40	37.67	33.19
100	33.00	49.69	43.19

The Société Belge Industrielle et Miniére du Katanga (a consolidation of the Belgo-Katanga and the Industrielle et Miniére du Katanga) absorbed during the year the Société Anversoise pour la Recherche des Mines au Katanga, and the Société de Recherche Miniére Lufira-Katanga. Its capital was raised to $2,700,000. The Company owns the Muika tin deposit, about seventeen pipes of kimberlite, some of which at least are diamondiferous, and numerous other mining claims.

Tungsten in the form of hübnerite, wolframite, and scheelite, the tungstate of manganese, iron, and lime, respectively, is widely distributed in Nevada, according to *Press Bulletin* 10 of the Mackay School of Mines. In addition to that mined at Round Mountain and the Bonita district, White Pine county, it also occurs at the following localities: Hübnerite is found near the state line, west of Lida, in Esmeralda county; at Redlich, Mineral county; at Tonopah, with gold ore, Nye county; and at Regan, on Mt. Wheeler, White Pine county. Wolframite and hübnerite occur together in the Gold Run district, 15 miles south of Golconda in Humboldt county. Hübnerite and scheelite occur together at Ellsworth in Nye county and at Hub, 12 miles southeast of Osceola in White Pine county. Wolframite is found 12 miles south of Pioche in Lincoln county. Scheelite occurs at Browns and Rebel creek in Humboldt county; near Oak Springs in Nye county, and in Washoe county.

Ancient River Channel Mining in California

By J. D. HUBBARD

More attention is being paid of late to drift mining in California, and deservedly. This long neglected branch of a great industry has paid so well in the past that it is no wonder enterprising men have re-entered this field and the prospect for a revival of this class of mining is good. The argonauts, whose indomitable spirit is so badly needed these days in mining, traced the gold-bearing sands and gravels of their day to the principal source, that is, to the 'break-outs' of the ancient river channels. These lava-capped sluice-boxes of nature have yielded a large part of the gold recovered in this state. At least one-third came from the ancient river channels. There is little doubt that three times the amount of gold already produced remains locked up in these treasure houses below the lava cap.

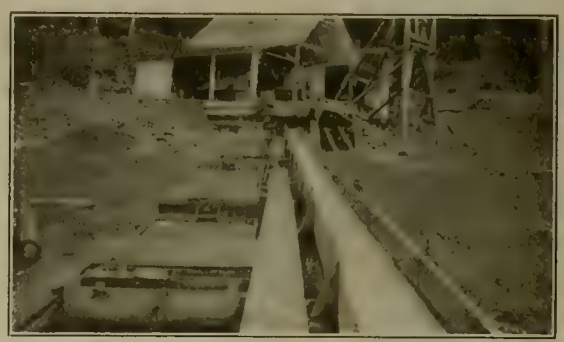
California has produced to date in gold approximately $1,600,000,000, or one-seventh of all the total won in the world since 1492 has been mined in California since 1848. How much gold is left will remain the unsolved mystery for ages, perhaps, but the estimate must be based on the known unworked compared to the known worked areas. Some of the ancient channels worked as drift mines have had exceptionally rich areas. In the Perschbecker or Magalia, and the Indian Springs mines in Butte county, old miners tell of gravel shoveled off the bedrock that contained $80 to $100 to the shovelful. And balancing this extraordinary statement with the known production and areas worked in these mines, they seem to have some basis. Unfortunately, miners as a class are regarded as something of prevaricators, but while scorning to associate with amateurs in their line, their 'historical romances' often have foundation in fact.

The ancient river channels contain more gold for a given area than the later channels because they were the result of a vastly longer period of erosion.

After working 'pan' and 'Long Tom' to their limits in the shallow gravels, the early miners were compelled to adopt new methods as the banks of gravel grew higher and steeper. The hydraulic giant came into wide use, and by that method the Tertiary gravels were washed out in many places well under the lava cap. After that, speaking strictly of the Tertiary channels, the limits of the hydraulic giant having been reached, it became necessary to drive farther in on the course of the streams and mine the gravel out on a smaller scale. This became known and classed as drift mining.

After determining the trend of the channel as correctly as possible by tracing the lava flows and rim rocks and by whatever geological features are available, the important thing is to find the pay-streak. All the channels have this, although some of them pay from rim to rim. But always there is the richer 'run'—generally but not always on the bedrock in the lowest part of the channel, and generally following the short side at a turn. Again, nearly all channels have their poor spots and their rich ones. Many a drift mine has ceased operations because the owners too often celebrated the working out of a rich spot and set nothing aside to tide them over a poorer one. On the whole, the upper reaches of these channels are profitable. The dredges are taking care of the deep low-grade gravel in the valleys and are adding several million dollars to the world's wealth every year. Coarse gold does not travel far, and if the valley gravels pay so well to the dredge, it is a safe conclusion that the lava capped gravels higher up must contain the greater amount of gold.

The next, which had better be the first, difficulty to be



ARRANGEMENT OF UNDERCURRENTS AT THE NUGGET MINE.

considered is the mine owner himself. Many of the men who think themselves mine owners, have in fact but insecure hold on the properties they profess to own. Titles are generally in poor shape. Much of the assessment work is not done at all after the first flush of the mining fever is over, and some of it is mere pretense. Some claim owners, to avoid trouble, give the required $100 to somebody to do the work. The man supposed to do the work may look at the claim in question on his way fishing, or may put in a couple of days' work there, in due course filing the 'proof' of labor at the county seat. This is more serious than it may seem, for it is responsible for the holding up of a lot of mining property that otherwise might be worked. The law plainly states that $100 worth of work must be done on each claim or location, and the mere fact of paying the amount required and then filing proof of labor is not sufficient to protect the title. The deep seated prejudice of the 'old timer' against 'claim jumping' is responsible for this condition which is a stumbling-block to the mining industry.

The only way to settle the title question is for the owner to get, and keep up to date, his abstract of title, which facilitates the handling of his property in case of sale. Also the price must be reasonable and the terms reasonable. The owner cannot expect another to do a lot

of development work to prove the value of the ground. It would be like betting the owner the actual price of the development work against nothing. The days of the 'sucker' and the big cash price are over, and the first essential to further revival of this branch of mining is a reasonable attitude on the part of the owner. The operator is the one who really takes all the chances and is deserving of every consideration. A fair plan is to set a price and then take the payment from a certain percentage of the gross output, depending on the richness of the mine. In case of forfeiture the owner has the benefit of the development work done, and so has nothing to lose by this arrangement.

The cost of drift mining varies greatly according to the conditions. At the Mayflower mine in Placer county, according to F. Chappellet, mining cost is $1.19 per ton, and milling with steam power, 25c. per ton, or a total of $1.44 per ton. This was in cemented gravel and more expensive to mine and treat. At the Big Dipper mine, the same class as the Mayflower, according to G. B. Hobson, the total cost was $1.85 per ton. At the Hidden Treasure mine, where the gravel is not milled and the work is done on a large scale, the cost per ton is as low as 92c. At the Mineral Slide mine, near Magalia in Butte county, where the face is blasted down and then the gravel hydraulicked out by water under pressure, the cost is as low as 65c. per ton. This is about the lowest figure recorded. At the Nugget mine at Toadtown, in Butte county, where an incline was run under the lava cap and all gravel hoisted and water pumped, the total cost was $1.37 per ton, increasing to $1.73 per ton as further depth was gained. This shows that under unfavorable conditions drift mining is profitable. The gravel in the Nugget mine averaged $6 per ton (or yard) for 110 ft., and $3.08 per ton for 496 ft. Some of the gravel went as high as $50 per ton. The gravel in the Nugget mine is all free washing, no cement gravel being found. The following details of costs for an average month at this mine may be of interest:

Tons of gravel mined	604	573
Dynamite	$ 33.60	$ 80.96
Fuse	5.64	11.30
Detonators	3.06	4.92
Rails	14.00	16.00
Ties	2.16	0.88
Lagging	1.92	0.96
Timber	2.67	1.80
Candles	3.45	5.27
Power and lights	22.64	22.00
Oil	1.20	1.05
Air pipe	4.60	4.80
Water pipe	5.40	6.00
Wire and lamps	1.30	1.45
Labor	479.25	593.75
Superintendence	150.00	150.00
Depreciation at 5%	100.00	100.00
Total	*$830.89	$1001.14
Per ton	1.374	*1.735

*Month of highest cost.

In contrast to many Australian drift mines, the gravel in the California drift mines rarely contains much clay, owing to the prevailing harder bedrock and the greater fall of the ancient rivers. Consequently the Australian methods of puddling, or comminuting the clay by revolving drags in pans are practically unknown in California. There are many localities in California where plenty of clay has been found in the later gravels, but the ancient channels of the Tertiary are remarkably free from this objectionable material. Clay may be all right in a 'pipe,' but troublesome in a sluice-box where it will gather up much small gold on the journey through, and hold it until disintegrated by the air, and lying on the waste dump, the gold is thus lost.

At present, weather conditions have curtailed activities in drift mining in Butte county, but during the year past, many old properties were opened up and the demand for this class of mine was very gratifying. The Mineral Slide, near Magalia, has been a steady producer, as has also the Nugget mine at Toadtown. The Old Indian Springs mine below De Sabla has been opened by some enterprising San Francisco mining men, who cleaned out and retimbered the old drift throughout its length, 5282 ft. They are now developing the gravel and hunting the 'pay,' with the chances in their favor for a good mine, considering the richness of the average gravel already taken out. They deserve success for their efforts. The Robbers Roost, Cole, Emma, and Kidd drift mines, near Nimshew, are all developing. The Emma is in 'pay.' Three plucky miners tackled the discouraging job of cleaning out the old drift, putting in air-pipe, and then driving for the channel, which they cut late in November. The first twelve pans of gravel, it is reported, yielded $32 in gold. The Royal Drift mine on the west side of Butte creek is developing steadily. This Company controls 1400 acres. The old Best drift, also on the west side of Butte creek, is being opened by the owners, who will prospect the mine thoroughly. Development has been done also on the Palace mine, just across the creek from the Best and the continuation of the same channel. Development is also being done at the Emancipation mine farther up on Butte creek. At the Kirby mine near De Sabla the shaft is being deepened preparatory to driving for the channel. The Pacific Gas & Electric Co. at De Sabla had an increase in business the past year due to the drift mines alone.

This locality has been a famous producer in the past, approximately $12,000,000 in gold having been taken from the Tertiary channels within a radius of three miles of De Sabla. The coming year will probably record a good gold production from this locality, and a further revival of interest in the exploitation and development of the ancient river channels of California which have been so productive in the past.

EXPORTATION of iron ore from the port of Lulea, Sweden, during the shipping season of 1914, namely from May until November, amounted to 1,034,350 tons. During the same period of 1913 it amounted to 1,471,450 tons.

GOLD OUTPUT of Victoria, Australia, was valued at £1,740,300 in 1914, compared with £1,840,700 in 1913.

Practical Rules for Cutting Mine Timber

By BERNARD CARR

*The following suggestions or rules are offered to the young miner or timberman to assist him in cutting and placing mine timber in flat seams with a maximum of economy, and at the same time make his work easier. The practical timbermen throughout our various collieries, who have their own good methods of cutting timber, may perhaps find nothing new in these rules, or they

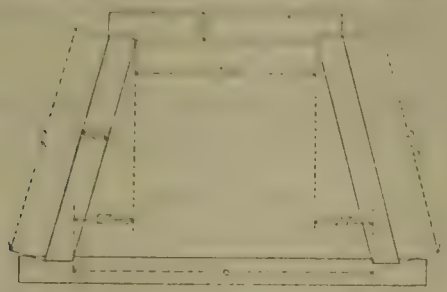


Fig. 1.

may even know of better ones than those suggested; but for the young timberman who is seeking to simplify his task and at the same time perform his work both efficiently and economically, the following instructions should prove of value.

To find the bevel on the heel of the leg on which the collar rests, divide the spread of the leg in inches by the length of the leg in feet. Cut the notches in the collar horizontal or level. This rule will be found ac-

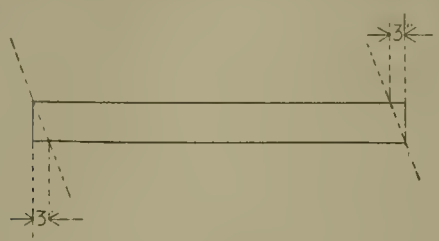

Fig. 2.

curate for timber 12 in. diameter, regardless of the length or spread of the leg.

Example: A gangway is timbered with a collar whose notches are 7 ft. apart, and two 9-ft. legs spread 11½ ft. apart, timber 12 in. diameter. What is the bevel on the heel of the legs? The spread of each leg (11½ — 7) ÷ 2 = 2¼ ft. or 27 in., 27 in. ÷ 9 (the length of the leg in feet) = 3-in. bevel of each leg.

Putting this in the shape of a formula, we have:

$$B = \frac{S}{L}$$

in which B is the bevel in inches, S the spread of the leg in inches, and L the length of the leg in feet. If stood on a mud sill as shown in Fig. 1, the timber will have the same bevel top and bottom.

In cutting the bevel in a crooked piece of timber, the miner's method for determining its equal sides should be used. This method, which requires but a knowledge of short division and the use of a tape-line and level, is as follows: Place a knife in the ring at the end of the tape and stick it in the centre of the end of the timber to be cut. Measure the front side of the leg to the

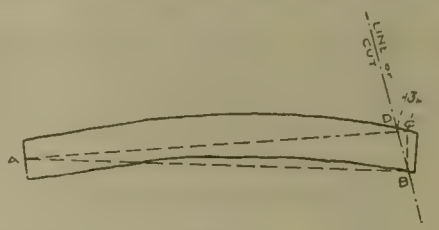

Fig. 3.

required length and mark it with a piece of chalk. Swing the tape to the back of the timber and make another mark. Then from this last mark in back of the timber measure down the bevel distance 2, 3, or 4

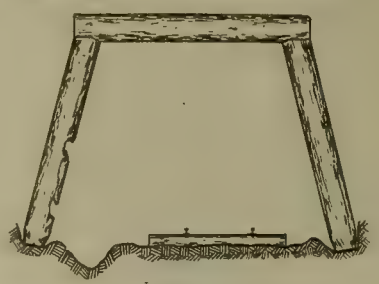

Fig. 4a.

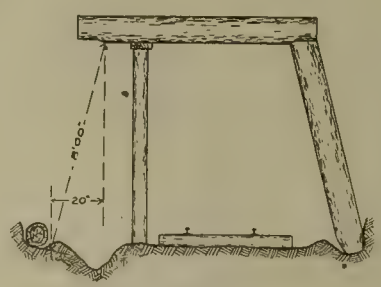

Fig. 4b.

in., whatever the required bevel may be as determined from foregoing rule. It will be found that this bevel will fit perfectly.

When one of the legs in a set of timber is broken and the leg and collar is good, the broken leg may be replaced as follows: After putting a brace under the

*Abstract from *Employes' Magazine* of the Lehigh Valley Coal Company.

collar as shown in Fig. 4a, chop the broken leg out. Hang the tape plumb from the notch in the collar and the floor of the gangway to obtain the vertical heights, and then measure in inches the distance from the tape over to the hole in which the leg stands. This will give the spread which, divided by the length of the leg (in feet) will give the bevel to be cut on the new leg. For instance, if the timber is 12 in. diameter, the length of the leg 9 ft., and the spread 20 in., the bevel will be

$$20 \div 8 = 2\frac{1}{2} \text{ in.}$$

The foregoing rules for obtaining the bevel to be cut on the heel of the leg was figured for timber 12 in. diameter. The bevel on the heel of any leg will vary as the length of the leg and also as its diameter. Given the length of the leg and its spread, the bevel can be found from the formula $B = \frac{S}{L}$. This bevel will be based on timber 12 in. diameter. Then by proportion and by comparing the diameter and bevels, the desired

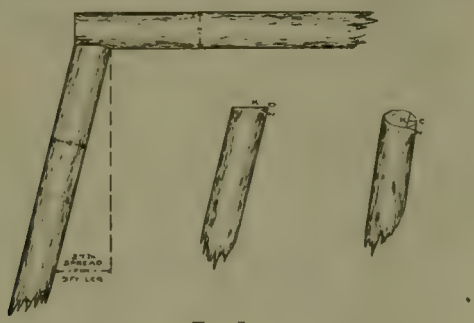

FIG. 5.

bevel may be found. For instance, suppose the diameter of the timber in the first example, whose legs were 9 ft. long and spread 27 in., was 18 in. instead of 12 in. First find the bevel for 12-in. timber from the formula $B = \frac{S}{L} = \frac{27}{9} = 3$ in. Then:

$$12 : 3 :: 18 : x. \qquad x = 4\frac{1}{2} \text{ in.}$$

For 8-in. timber the proportion would be the same:

$$12 : 3 :: 8 : x. \qquad x = 2 \text{ in.}$$

Thus it may be seen that regardless of the length or spread of the leg, the correct bevel for 12-in. timber is found from $\frac{S}{L}$, and by proportion the bevel for timber of any diameter is readily determined.

The depth of the notch in the collar, like the spread of the leg, varies with local conditions. As a general rule, however, the depth of the notch should be cut to about ¼ the diameter of the collar. That is, a collar 12 in. diameter will have its notch cut $12 \div 4 = 3$ in. deep.

All collars should be cut with a bevel to rest on the facing of the leg. This bevel in the collar should be ⅛ in. for each inch of diameter of the collar. Thus, for a 12-in. collar the bevel will be $\frac{12}{8} = 1\frac{1}{2}$ inches.

To find the facing on the front of the leg, add the bevel on the collar to the bevel on the heel of the leg. Thus, for 12-in. timber 3-in. + 1½ in. = 4½ in. facing. (See K O on Fig. 5.) Then cut K N intersecting N O, which is equal to the depth of the notch in the collar, that is, 3 inches.

The length of the collar is the distance between the notches plus twice the diameter of the timber.

Though the foregoing figures were based on timber 12 in. diameter and 9 ft. long with a spread of 27 in., the rules will be found to work through proportion for any size timber used.

Underground Haulage in the Bunker Hill & Sullivan Mine

By J. W. GWINN

*The underground haulage system in this lead-silver mine is the most extensive in the Coeur d'Alene district, comprising about 35,000 ft. of tunnels, drifts, and cross-cuts where locomotive haulage is in use. The main working adit, known as the Kellogg tunnel, or No. 9 level, is approximately 10,000 ft. in length from the portal to the main working shaft, and extends beyond that about 4500 ft. in each of two directions. On this level all the ore from the Bunker Hill & Sullivan, the Sierra Nevada Consolidated, and the Caledonia Mining Co., an average of 44,600 tons per month, is hauled to the mills, situated a short distance from the portal. Electric haulage by the trolley-type locomotive is used on this level throughout.

Below this level, at intervals of 200 ft. vertically, are five other working levels, No. 10, 11, 12, 13, and 14; and the total haulage distance on these, where electric locomotives are used, is approximately 16,000 ft. Of the four levels equipped with electric haulage, No. 11, 12, and 13 have storage-battery locomotives, and No. 10 still retains the trolley type by reason of the small and decreasing tonnage produced.

Electric power is supplied to the mine by two systems. The first, the 500-volt direct-current trolley, was installed in 1897 when the Kellogg tunnel was started, and was extended as the tunnel advanced. The second circuit, 2300 volts, alternating current, was installed in 1907, to furnish power for the pumps, as well as lights for the shaft and stations, and for preheating compressed air for the hoist.

The first storage-battery locomotive to be installed, replacing a 2½-ton Jeffrey trolley type, was a Jeffrey, weighing 5000 lb., on No. 11 level; the second installation, replacing a 4½-ton General Electric trolley type, was made on No. 12 level, a Westinghouse storage-battery type being installed weighing 7600 lb.; and the third installation was on No. 13 level, with a General Electric storage-battery locomotive weighing 8000 lb.

*Abstract from *Transactions* of the A. I. M. E., February.

Canadian Mining Institute Meeting

The seventeenth annual convention of the Canadian Mining Institute was held at the King Edward hotel, Toronto, March 3 to 5. Owing to the war and the financial depression the attendance was not so large as on previous occasions, but an excellent program was presented and the discussions were of an animated character. In the absence of the president, G. G. S. Lindsey, at present in England, the chair was occupied by the first vice-president, A. A. Cole, mining engineer of the Temiskaming & Northern Ontario railway, who in his opening address alluded to the mining districts of northern Ontario as the brightest spots in Canada, since there are no labor troubles and the companies are continuing to pay dividends.

Hon. G. Howard Ferguson, Provincial Minister of Mines, welcomed the convention to Toronto on behalf of the Ontario government in an address that created a favorable impression.

The first business taken up was the amendment of the by-laws respecting the election of councillors who, to the number of 20, have hitherto been elected by the members at large, with the result that the great majority have been residents of Ontario and Quebec, the other provinces having but few representatives. Amendments moved by Clifford E. Smith and seconded by A. G. Burrows provide for their election by provinces. British Columbia for this purpose including the Yukon, Alberta being grouped with Saskatchewan, and Manitoba and the Maritime provinces forming another group. Each province, or group, is to be represented by a number of councillors proportioned to the resident membership, who must reside in the provinces they represent.

A. A. Cole, representing the Cobalt branch, moved, seconded by Norman Fisher, that the consideration of the amendment be postponed until the next convention, as this was an abnormal year on account of the war. At a rough estimate 10% of the members had gone to the front. A. J. Young, Toronto, urged that the representation of the outlying provinces according to their membership was not a matter of favor, but a matter of right. J. A. Dresser, Sault Ste. Marie, thought that those in outlying districts, should, if they saw fit, have power to elect non-residents. Many of those at distant points could not attend the council meetings. H. E. T. Haultain, Toronto, strongly supported the amendments. For the past five years, out of 50 nominations to the council only 8 were resident outside of Ontario and Quebec. He objected to discussion being smothered by appeals to sentiment and thought that "Business as usual" should be the motto. F. D. Adams, Montreal, favored postponement. After a keen discussion the motion to postpone action was defeated and the amendments carried by a vote of 48 to 21.

John McLeish, Thomas W. Gibson, Theo. C. Denis, and D. B. Dowling presented preliminary statistics of mineral production which will be summarized next week.

M. Dowling presented a paper on 'Structural Geology of the Alberta Oilfields.' Six or seven companies were boring for oil on the Turner Valley anticline and in addition to the original discovery and the No. 2 well several of the wells had showings of oil. The wells in the broken country of the foothills, however, were not successful and he did not think that neighborhood offered much prospect. One of the wider anticlines to the northwest of the original discovery had yielded a little oil, and three or four wells on the Milk river show encouraging results.

A discussion on the stimulation of prospecting was led by H. E. T. Haultain, of Toronto, who urged that the decline in mineral production showed the need of encouraging prospecting in order to make new discoveries. The debate took a very wide range, many suggestions being made as to the best means of inducing more prospecting activity. G. R. Rogers, Gowganda, said that the government should subsidize prospectors as was done in Australia. T. W. Gibson said he had looked into the subject but was unable to ascertain that any new or important field had been brought to light by state-aided prospectors. George A. Guess, Toronto, thought that valuable suggestions on the subject could be obtained from the state of Colorado. Arthur B. Clabon, Vancouver, said business men should unite to stimulate an industry which was worth so much to commercial interests and co-operate with the prospector. Several speakers favored giving the prospector a percentage of the value of his discoveries. A communication received from R. W. Brock suggested that mining property should be held only as long as the owner worked it, and afterward should revert to the Crown and be open to prospectors. Mr. Haultain pointed out that invention had been organized instead of being left to individual initiative. The government and large corporations should in the same way organize prospecting and train young men for the work. He moved that the question be referred to a special committee to decide upon some definite measure. The resolution was carried.

At the evening session, E. T. Corkill, of Copper Cliff, described 'Safety Engineering at the Canadian Copper Co. Works and Mines at Copper Cliff,' illustrated by moving pictures showing safety work at the plant of the New Jersey Zinc Co. David H. Browne read a thoughtful and digestive paper on 'Things We Might Have Done,' showing the benefits often realized by experience gained from failures.

On the second day a resolution moved by Frank D. Adams and seconded by T. W. Gibson, expressing the thanks of the Institute to those members who have enlisted for active service, was passed with enthusiasm.

Mr. Adams read a paper on 'The Conservation of Our Mineral Resources,' in which he strongly combatted the prevalent impression that the natural wealth of Canada was inexhaustible, shared even by leading public men. As a matter of fact the resources have been seriously impaired by wasteful methods of production. In metallic mining there is but little avoidable waste, but there had

been much in connection with coal-mining. In Nova Scotia as much coal was formerly wasted as was taken out, but more economical methods have now been adopted and are enforced by strict government inspection. But there is still a good deal of preventable waste in the new coal areas of the West. In Alberta, which has 87% of the known coal reserves, the lessees of coal lands can adopt such methods of operation as they please and exploit a mine by taking the cream and leaving the remainder. Great saving could be effected by the use of gas producers in place of steam engines, and the substitution of by-product coke ovens for the beehive ovens, which has to some extent taken place in the East, would save much tar, sulphate of ammonia, and other valuable products which now go largely to waste.

Charles Fergie, of Nova Scotia, said that in that province as well as in British Columbia, the maximum amount of coal is now being taken out. The mines in those provinces are systematically laid out with a view to the prevention of waste. It should be borne in mind that the large total of the Canadian coal reserves includes deposits in inaccessible regions and seams so situated that they could not be economically worked. Small mines are often opened and worked for a temporary profit and then abandoned, leaving the remainder of the coal unworkable. The Dominion government should appoint an official to see that all mines are carefully laid out and systematically worked. James McEvoy, Toronto, contended that conservation should be judiciously applied, otherwise important industries might be injured, as the coal mining industry of Alaska had been by too stringent restrictions.

Walter A. Schmidt, of Los Angeles, gave a paper on the Cottrell process, tracing the development of the process for controlling fume and saving the metallic and chemical content. His paper, which excited great interest, was illustrated by lantern slides and moving pictures, showing the process in operation. It was followed by a demonstration with a model of the apparatus.

'The Smelting of Titaniferous Ores in the Blast-Furnace' was the subject of a paper by Bradley Stoughton, New York, who referred to the large deposits of titaniferous ore in Canada. A prejudice existed against this ore, which has lately been lessened, as actual practice had shown that ores containing 5 to 20% of titaniferous oxide can be smelted successfully. Ore containing as high as 36% of titaniferous oxide has been smelted in England. If titaniferous ore were used in as large proportion as could be done without interfering with the smelting process it would greatly increase the Canadian ore reserves. A discussion followed, some of the speakers expressing the view that it would be difficult to induce the blast-furnace men to use titaniferous ore.

E. B. Thornhill, Cobalt, read a paper on 'The Recovery of Mercury from Residues of Amalgamated Cobalt Ores,' describing the process pursued at the Buffalo mine, which yielded mercury remarkably pure and free from arsenic. The annual dinner was held in the evening.

Regulations Governing Placer Working in Western Canada

Under date of January 26, 1915, an Order in Council has been issued governing placer mining on bar diggings by hand methods. In view of the demand which exists in the Edmonton mining district for small areas of placer mining ground to be operated by rocker and grizzly hand methods, the Minister of Interior has granted permission to acquire such ground on the North

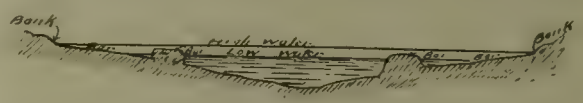

Fig. 1.

Saskatchewan river and elsewhere, in the provinces of Saskatchewan, Manitoba, Alberta, and the North West Territories under these conditions:

1. Bar diggings shall comprise lands in and along any river over which the water extends during the high water, but which are not covered at low water.

2. Bar diggings shall comprise a strip of land 100 ft. wide along the high water-mark of any river and thence extending into the river to its lowest water-level.

3. Any person desiring to work bar diggings, the property of the Crown, may, upon payment of a fee of

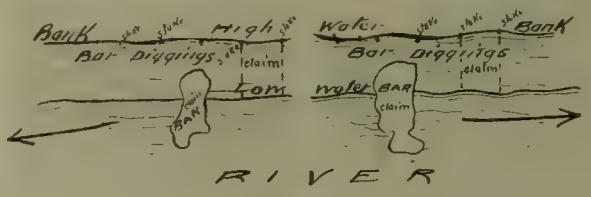

Fig. 2.

$1 to the mining recorder for the district in which the rights applied for lie, obtain a certificate upon the following form: "This is to certify that ——— of ——— has paid me, this day, the sum of $1, and is therefore entitled to all the rights and privileges prescribed by Order in Council governing the granting of bar diggings on the ——— river. (Signed) ———, Mining Recorder." This certificate will entitle the holder to stake out in accordance with the provisions of the regulations governing placer mining in Manitoba, Saskatchewan, Alberta, and the North West Territories, and work bar diggings of the dimensions above described.

The holder of the certificate who has staked out available ground in the manner above described, and illustrated, may continue to hold the same as long as he continues to operate it, but in case of a claim staked out under these regulations remaining unworked for three consecutive working days, the rights acquired under such staking shall absolutely lapse, unless a 'lay-over' has been granted by the mining recorder. There is much interest in the possibilities of the placer deposits of western Canada.

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

Who Will Engineer the Engineers?

The Editor:

Sir—The reopening of the discussion of "what is the matter with the mining profession?" is of timely interest to a large number of engineers. I recently received the record of 46 members of the 1911 graduating class of the College of Mining connected with a large Western university, bearing out in a striking manner some of the statements made by 'A. Engineer.' In the four years that have elapsed since graduation, nearly 50% have given up mining. That, in itself, would be of little importance, were it not for the fact that the list of those who have strayed from the fold includes many of the most competent men, who are now holding positions in other lines of work relatively higher than they could hope to have held had they remained with their profession. Another significant fact, emphasizing the statement of 'A. Engineer,' is that most of the ones who have deserted mining are those who have married. A statement by an applicant for a position that he is married and expects some sort of living accommodations where the mine is not situated near some town, usually reduces to a minimum his chance of obtaining the place. This statement may not apply to all branches of mining, but it certainly does to the majority of gold mines.

One cause of the low pay of managers and superintendents is, I believe, the increasing number of properties being purchased under bond and option, in which an attempt is made to meet payments from current earnings of the property. The result in many cases is lack of development work, use of antiquated machinery, and a tendency to gouge out the high-grade ore, regardless of the future. When the inevitable day of reckoning comes, payrolls suffer.

The foregoing was not written in a spirit of pessimistic fault-finding, but rather in the hope that a frank discussion of the case may lead to a palliative, if not a remedy, for the conditions generally admitted to exist. Personally, I admit having fallen a victim of the wave of optimism that has swept the country in the past few weeks, and believe that the mining industry is beginning to recover its lost "place in the sun."

Looking toward a remedy for the conditions, I would suggest the appointment of a committee of the A. I. M. E. having that end in view.

KCN ENGINEER.

[This is a problem of acute interest to many mining men, and one well worth discussion.—EDITOR.]

Rhythmic Precipitation of Colloidal Ores

The Editor:

Sir—Your editorial, 'Banding in Ore Deposits,' in the *Press* of January 9, 1915, brings up a subject of great interest and one that has occupied the earnest attention of the best minds in the profession.

I make no claims as a mineralogist nor as a geologist, although this last science has had a fair amount of my attention, both in the literature and the field, for the past 20 years, and I have always been deeply interested in the articles and discussions by the recognized lights in these sciences. So when such men as J. F. Kemp occupy themselves as he does in the discussion of 'Rhythmic Precipitation and Colloidal Ores,' in the same number of *Mining Press*, it is with the greatest trepidation that one of my limitations presumes to join in. However, I have had charge of and collaborated as engineer, foreman, and manager, in the development of mining properties both in the United States and Mexico, and being somewhat of an observer, as well as student, I have noted many curious things in relation to veins, ledges, and ore deposits; and for the past ten years have held some opinions in regard to their formation that I will now endeavor to elucidate, hoping that they will meet with a charitable reception, if not acceptance.

It is generally agreed that many ore deposits are the direct or indirect result of replacement; and I am led to believe that all ledges, with some rare exceptions of sedimentary origin, perhaps, are formed by replacement. Where one watches intimately the development of a mine, day by day, he notices many little changes and blendings that escape the notice of the untrained mind, and that, also, of the expert in the profession who may visit the property for special study, when dust and powder smoke have obliterated all traces of nature's hand-writing.

If we accept the premise that most ledges *are* the result of metasomatism, and take into consideration that replacements take place very gradually and at different periods, it will be easy to conceive of a solution for ledge formation, and even banding, and deposition of minerals and metals in the same, if we take into consideration the probable motive for the formation of the ledge and the well known necessary conditions.

From your editorial and Mr. Kemp's article, I judge you conceive the original 'mold' to be an open fissure, filled with solutions, depositing the gangue on each side

and gradually filling up the fissure toward the centre. This may be the case, sometimes, but let us conceive the original fissure as simply such, with no or but slight separation of the walls, a fault plane, if you please, with the side-walls shattered and cross-fissured for a greater or less distance each way. With this condition, and the necessary thermal conditions, all will concede, with the circulating waters supercharged with the minerals, and metals perhaps, seeping along the main fissure or rent, and penetrating, in all directions, into the country rock, each way, for a more or less limited distance, thoroughly saturating the shattered rock, and in time, geologically speaking, we have a replaced silicified body of irregular dimensions of greater or less width.

In these early geologic times internal cosmic movements were frequent and intense, if we may judge from the scars on the earth's face; and the first transformation hardly takes place before intense movements, horizontal and vertical, following the lines of least resistance, again shatter the ground along the original fissure. But as the narrow replaced zone is harder than the adjacent country rock, it, the replaced zone, may hold together, although often it too is shattered and fissured and even faulted, in which case, one or two new fissures, more or less parallel to the original, are formed, one on each side of the ledge matter, ore perhaps; and subsequent, if not contemporaneous, movements, each way, cause a grinding and shattering of the weaker, and perhaps decomposed, country rock, while, at the same time, they smooth or polish the sides of the replaced body, now taking the shape of a ledge, and we have the walls.

The first replacement may be but a few inches in thickness, and again it may be many feet, all depending on the amount of lateral shattering. The greater the extent of the shattering, the greater the replacement zone is liable to have been. In this last case there would be no banding. If the fissure be direct, with little stress, and the narrow zone, by contemporary movements, be ground fine and the naturally ragged walls smoothed somewhat, the circulating waters will replace the country rock, depositing silica, let us suppose, as this is the simplest and the most common medium, forming a compact vein.

Later or successive movements may form slickensides on one or both sides, and this, in turn, will be replaced, perhaps, by a solution of different composition from the first, and this new layer will be cemented or 'frozen' to the prior layer, and be, perhaps, of a different color and carry a different metal content. This process repeated during aeons will produce a ledge of banded structure.

As you say: "The transition from one crust (layer) to another is usually distinct and abrupt, but it is hard to imagine how similarly abrupt changes could take place in the composition of the solutions, * * *" you having in mind a solution coursing along an open fissure, depositing its mineral on the sides. To conceive of banding under such conditions is not only hard to imagine, but is almost absurd, may we not say? These changes, as a rule, are *not* made suddenly in Nature's workshop; but the transformation takes place slowly, very slowly; so slowly, perhaps, that it is hard for present-day mortals to conceive of it, any more than we can the infinite, except by faith. I am not taking issue; but hope by this to draw out on the subject such trained minds and keen observers as T. A. Rickard and others, from whom I have, in years gone by, learned much.

I have seen cases of one wall with very evident replacement extending one way, blending gradually and perceptibly from pure metal-bearing quartz out to pure country rock. Again, I have seen the fissure, both walls together (in igneous rock), worn smooth, and the gangue blending each way into pure country rock. And again I have seen the usual hanging and foot-walls with ground material (slickensides) between the walls and the ledge proper, and the ledge polished, in places, on the wall sides. Sometimes this happens only on one side, while the other side is 'frozen.' I have seen, as nearly every mining engineer has seen, the banded structure parallel to the walls; and I have seen, as they must have also, seams of ore or gangue adjacent to the main body, sometimes partly frozen to this, but at times with a distinct cleavage between, and at times with a minute seam of slickensides between. At other times I have noted slickensides composed mostly of crushed and pulped ore. I have seen a ledge composed of 4 ft. of silicious sulphide ore on the foot-wall, with about the same width, on the hanging wall, of secondary calcite, carrying a fair percentage of Fe_2O_3, adjacent and 'frozen.' There was a well defined line of separation, but no separation in fact of the two bodies. These annotated conditions, together with the well known metasomatic phenomena, have induced me to come to the conclusions above given.

Electricity probably played a greater part in the formation of orebodies, and especially in the precipitation or dissemination of the metals in them, than we have any conception; and it is easy to conceive the reason for the enrichment of the contents of one fissure intercepted by another carrying solutions of different composition. The contents of neither fissure, having a silica base, we will say, need have had that base in a colloidal form, if that were possible under the cosmic conditions existing at the time of ledge formations.

E. A. H. Tays.

San Blas, Sinaloa, Mexico, January 23.

Gold and silver yields from several New Zealand mines in 1914 are as follows:

Mine.	Tons.	Value.	To date.	Dividends.
Talisman	52,210	£263,516	£ 2,368,261	£ 965,534
Waihi	183,405	329,773	10,772,662	4,681,388
Waihi Grand Junct'n.	115,710	227,600	1,026,297	110,000

The Talisman made an increase of £47,874 over 1913, and the Grand Junction £47,481, while the Waihi had a decrease of £3899. On No. 11 level on the Waihi the Dreadnaught lode was driven east for 92 ft., showing 30 in. of $9.12 ore.

CONCENTRATES

Readers of the Mining Press *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

Railroads of the United States earned $2,934,823,713, a decrease of $219,701,000 compared with the gross revenue in 1913.

Royalties paid by mines in Cobalt, Ontario, to the provincial government to the end of October 1914 amounted to $1,836,050.

Traffic through the Panama canal in January amounted to 454 vessels, with 2,192,856 tons of cargo. The working force in the Zone is now under 25,000 persons.

Lime consumption in treating an old dump of tailing at the Robinson mine, near Coolgardie, Western Australia, amounted to 120 lb. per ton. Preliminary water washes reduced this large expense.

Capacity of Pachuca vats may be found from the following formula:

$$\pi r^2 h + \pi r^2 \cdot \tfrac{1}{3} h_1$$

where π equals 3.1416, r equals the radius at the top of the vat, h the height of pulp in the cylindrical portion of the vat, and h_1 the height of the cone.

Electric blasting practice on the Rand had two extraordinary accidents, one in December and another in January, by which charged holes connected for firing were set off by lightning being conducted down the mine, in the latest instance by means of the wire ropes. Several white men and natives were killed by these premature explosions.

Aeration of pulp may be effected when the charge is being agitated with mechanical stirrers. If air is introduced into the bottom of an ordinary mechanical agitation vat it is retained in contact with the pulp for a very long time owing to the horizontal centrifugal action induced, and finally appears at the top of the vat in the form of imperceptibly minute bubbles.

Modern milling practice tends toward the rearrangement of well known machines rather than to any specific improvements in the design of pulverizers. Where fine grinding is practised, three or even four-stage crushing may be economically employed, each machine being chosen for successive reduction as being specially adapted for the grade of material it is called upon to handle.

Concentration tests with a table of the Wilfley type are best made by dividing the flowing edge into a number of equal sections, and by collecting the total quantity of ore overflowing from each of these for, say, 20 seconds; and also the concentrate produced during a similar period. The resulting samples should be dried, weighed, and assayed separately, and valuable indications of the distribution of metal in the ore may be obtained by this method. A screening analysis of the product from each section should accompany the tabulation of results.

Gold and silver of the Jewel-Denero mine, Boundary district, British Columbia, occur in the iron, copper, and lead sulphides in the ore, according to the report of Wm. Fleet Robertson, provincial mineralogist, for 1914. The 15-stamp mill crushed over 16,000 tons last year, cyanide solution being used in the mortar-boxes. A tube-mill grinds everything until 90% passes 200 mesh. The mineral is concentrated and returned to the tube-mill and ground in solution until very fine. The slime is settled, agitated, and filtered on a Moore machine.

Talc is one of the materials which is not very valuable in itself, but which is sold mainly on the basis of a business built up in prepared products. For example, talcum powder, under a well advertised brand, sells at a price which per ton is extremely high, but this is due, not only to the fine grinding and attractive package, but to the years of advertising back of the particular brand, and the expense put into building up the business. The United States imports something like 10,000 tons of talc per year, and the import price is about $11 per ton. We produce about 130,000 tons, worth, say, $1,430,000.

The principal market for barium sulphate on the Pacific Coast is among the paint manufacturers. For this purpose, it must be very light in color and ground extremely fine. Efforts to grind the material by dry processes have proved futile so far, at least in California. Continued treatment in a pebble-mill might accomplish this result, but the most satisfactory product is secured by flotation. The market for this product on the Pacific Coast has been variously estimated at from 1000 to 2000 tons per year, and the latter is probably nearly correct. The finished product sells at from $20 to $30 per ton under normal circumstances, and $25 would be likely to attract local purchasers. The preparation of the chloride and other compounds requires a large chemical equipment, and even the manufacturer of ground barite requires considerable investment. There is only one plant in this part of the country making any attempt in this direction, and that is the Barbour Chemical Co., at Melrose, California. This concern secures its ore at present from Mariposa county.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

JOPLIN, MISSOURI

PICHER LEAD CO.'S VALUABLE DEVELOPMENTS AND PLANS TO BUILD LARGE CONCENTRATING PLANTS AT NORTH MIAMI DISTRICT.—BRADLEY LEAD & ZINC CO.'S NEW MILL.—A W C MINING CO.'S NEW EQUIPMENT.

At the end of its first year of prospect drilling in the North Miami, Oklahoma, district, the Picher Lead Co., of Joplin, announces that it has sunk more than 40,000 ft. of holes, has blocked out a number of separate orebodies carrying both zinc and lead, and that eight 40-acre tracts out of a total of 3000 acres have been reserved by the Company, on which it will immediately begin active mining operations. Two shafts will be sunk on the most important ore discovery made on what is known as the Crawfish 'forty.' At one point on this tract, 29 drill-holes were sunk into a semi-sheet formation of ore, occurring at an average depth of 225 ft., and continuing down to as deep as 283 ft. in places, although the average thickness was nearer 20 ft. The drill clippings showed an average blende and galena content of 11%, the former predominating by the ratio of three to one. Prospect drilling will not be discontinued. On the other hand, the drill-rigs of the Company that have been working steadily in this district will continue, as it is the intention to carry on prospecting steadily for the ensuing two years. The prospecting campaign of the Picher company is the most extensive ever launched in the history of the Missouri-Oklahoma-Kansas zinc and lead district, and the announced intention of this Company to conduct mining activities, whereas it has confined itself solely to the lead-smelting industry in the past, is considered the most important mining news of recent years, if not the most important in the district's annals. The Company was spurred to launch its big prospecting and mining campaign through the fact that the production of the district, especially the production of lead ore, was not meeting the requirements of the smelters. The Company acquired 3000 acres of Indian lands under lease, and began drill prospecting at a point immediately north of the large developed area of the present North Miami mining district. The first few months netted no encouragement, and it was not until after the Company had spent $25,000 in prospecting alone that the first good deposit was encountered; this was in the extreme northeastern corner of the Company's holdings. Three distinct ore 'runs' were found, the first at 75 ft., the next at 130 ft., and the deepest at 200 ft. The tract of 40 acres on which this first ore was found has been leased to the W. M. Sheridan Co. (Inc.) of Chicago, and a shaft, 7 by 9 ft. in the clear, is being sunk to the deepest run of ore which was considered the most extensive. A large concentrating plant is to be erected on this lease. The Picher company, after sinking a number of holes into good ore on this lease, moved its rigs to a point near the Kansas line, and drilled a string of holes through 'hogchaw' ground without finding ore. The drills were then moved to a point east of a little stream known as Tar creek, which flows from north to south through the Miami district. No mining had yet been done east of this stream, all the big producers being situated from half to two miles to the west. Immediately east of the stream, however, the Company encountered rich shallow lead and zinc at a depth of 120 ft., and the 40 acres on which this find was made have been leased to the Ortt & Buchanan Mining Co. A shaft is now into ore and a concentrating plant is to be erected at once. The Company soon after making this find moved seven of its ten drills to the Crawfish and adjoining 40-acre tracts, some distance to the southeast, and the first hole revealed the orebody which has proved so extensive by subsequent drilling. The mineralized area has been blocked out as thoroughly as it is possible for drills to accomplish, for a distance of 600 ft. east and west, and 1200 ft. north and south. While the Picher company's first two shafts are under way, material will be moved to the ground to begin the construction of a 500-ton concentrating plant, and this will be only one of a number of similar large mills to be constructed in this field.

Operations have begun at the two properties of the Bradley Lead & Zinc Co. in the Chitwood district, northwest of Joplin. Mill No. 1 is situated on a lease of the St. Louis-Joplin Lead & Zinc Co.'s land, and embraces a portion of the old A B C Mining Co.'s lease, which was a heavy producer several years ago. The old A B C mill was burned. The Bradley company

AN ELECTRICALLY EQUIPPED ZINC MILL OF THE JOPLIN DISTRICT.

has constructed a new plant of 250-ton capacity, and has a new shaft into good ore south of the old workings. No. 2 mill is one-fourth mile to the southwest, and is situated on the old Martha Ball lease. The plant formerly used by the Martha Ball Mining Co. has been overhauled and improved, and now has a capacity of 250 tons. Mining at the A B C lease is in disseminated ore, occurring in faces 60 ft. high, while at the Martha Ball tract, a sheet-ore formation, 20 ft. thick, is encountered at a depth of 200 feet.

The A W C Mining Co., operating No. 1 and No. 2 mills, west of Joplin, has purchased the plant of the Grey Top Mining Co., in the North Miami, Oklahoma, district, and is moving it to a lease of the Luke & Ash land, immediately west of its present No. 2 mill. New shafts are being sunk, one at the site of the new mill, and another midway between the new mill, which will be known as No. 3, and No. 2 mill. At this midway shaft a large hopper is being erected and tramways built to connect with either plant. The feed from the hopper can be taken out at either the west or east side. This will be used as an emergency shaft to supply ore in case the production is cut off from either of the other shafts. The new mill will have a capacity of 250 tons. Operations in this district are conducted in sheet-ground at a depth of 190 ft. C. W. Edwards has leased to Longacre & Co. the Klondike mine at Klondike, four miles northwest of Joplin. The mill is being overhauled, and the ground has now been drained to a depth of 120 to 150 ft. The ore occurs in soft ground, necessitating timbering.

PLATTEVILLE, WISCONSIN

Result of High Prices of Spelter in the Wisconsin Fields. Market Conditions, Output, and Labor Shortage.

Never before in the history of zinc mining in the Wisconsin districts have such excited conditions been witnessed as prevailed all through the month of February. Spelter quotations broke all restraints in the closing days of the month, and some idea of the gains made can be best ascertained by making some near at hand comparisons. Spelter opened on St. Louis quotations, December 1, 1914, at $5.20 to $5.25 per cwt., closing on February 27 at $10 per cwt., thus recording in the short space of 60 days a doubling in value, as some of the spelter manufacturers were demanding $11 per cwt., St. Louis, on all deliveries for March and April. Spot metal had been entirely cleaned out of the markets, and grass mill special was being quoted in advance of $11, with users turning their attention to substitutes, presumably high-grade Prime Western metal. Foreign buying orders had been filled for 1914, aggregating 58,000 tons, against about 7500 tons for the preceding year, which in itself was the beginning of the incentive for higher prices, but this demand fell off considerably during January and February of this year. This in nowise influenced an extremely active domestic inquiry, coupled with shortage of stocks in smelter's hands, which constantly grew more acute. Press and trade journal quotations closed the month 50 points under actual trading conditions, and producers showed a determined reluctance to give out information or figures for the benefit of the press. Spot and future delivery quotations are separated by a narrow margin, and it would not be the least surprising to see this margin evened up and spot and future running on even terms at the close of the current month. The situation is so overbalanced that producers claim high prices will prevail for the entire year 1915, and possibly beyond.

Sheet zinc producers advanced their base to $12.75 f.o.b. in the closing days of the month, Illinois points, less 8% discount on car lots. Exports of spelter, all varieties of make, for the month of February exceeded 5000 tons.

Prices for sphalerite, or zinc ore, kept pace with the riotous condition in the metal market. There was a period when mine operators claimed it was imperative that zinc-blende should command not less than $40 per ton for 60% metal content, in order that zinc mining might be conducted profitably, but for the first time in the history of this industry the base had risen to $69 to $75 per ton, basis of 60% zinc content, and one or two of the separating plants in the field realized fancy prices, running well over $70 per ton. Producers of zinc ore have been handicapped for years by low prices on ore, skillfully controlled, they say, by the smelter interests, who, however, reaped fair profits on low ore and metal. A long period of depression in zinc mining extending from March 1913 until August 1914, had placed the industry at low ebb. The exploration and development of zinc mines had become nominal, and now that prices have soared, there is feverish activity in all of the zinc mining regions to get leases, to rehabilitate abandoned properties, and hasten mine development on such properties as have been under observation within the past year. It requires at least six months to one year to develop and equip a zinc producer, and it is reasonably certain no great gains will be shown in production of zinc ore for another six months, and perhaps longer. The anticipation of yield yet to come out of the ground is certain to stimulate prices to attempt even higher altitudes than that already acquired. The output under the spur of such unprecedented prices as were published during February shows unappreciable gains. Miners are delighted with the situation, and now look forward to larger returns on a conservative production spread out over a considerable period of time, than through a strenuous attempt to meet with present demands at prevailing quotations.

Large consumers of metal in the East charged manipulation and concealed stocks during the beginning of February and did not realize the true situation until it was too late. Buyers of metal have been trying to option consignments for future delivery on short term options, but in this they have only partly succeeded. The truth of the matter is found in restricted stocks in the hands of both metal producers and consumers. The history of the spelter branch of the industry shows that for a score of years production and consumption have been about equally divided, and the surplus carried over at the end of the year was small. The diversion of any considerable quantity of metal, therefore, into new channels could but act as a stimulating impulse toward higher prices. Foreign inquiries have been less insistent, and metal was quoted in London through February at lower levels than prevailed in local markets.

Lead ore was in better demand following improvement in the metal markets, but prices showed no marked advance, and much metal remained concealed in stock bins. Producers of iron pyrite found a market without feature, and production was maintained, although much ore was carried over. Producers of carbonate zinc ore (dry-bone) witnessed a sympathetic attitude in quotations with spelter, 40% qualities at one time during the month going over $40 per ton, but the interests controlling this class of ore offered no market, and demand was entirely absent. Scores of small operating concerns were diligently engaged in piling up mill feed for the open season cleaning, and a tonnage conservatively estimated at over 2000 tons was carried over at the end of the month.

Severe winter weather and heavy snows prevailed over the greater part of February, and outlying mines were completely isolated; in the northern half of the field traffic was blocked for a week. Shipments failed to keep pace with demand and a reserve of 4000 tons of concentrate was carried over at the close of the month. Shipments of ore out of the field, and to separating plants in the field, during the month, were as follows:

Districts.	Zinc, pounds.	Lead, pounds.	Pyrite, pounds.
Benton	8,608,000	.....	1,261,600
Galena	4,208,000	85,000	.....
Hazel Green	3,284,000	.....	.....
Livingston	2,918,000	.....	.....
Cuba	2,092,000	.....	.....
Platteville	1,324,000	80,000	.....
Linden	1,132,000	79,000	.....
Mifflin	1,020,000	.....	.....
Shullsburg	466,000	.....	.....
Highland	66,000	.....	.....
Mineral Point	60,000	.....	.....
Totals	25,178,000	244,000	1,261,600
Mineral Point Zinc Co.	4,454,100	.....	.....
	29,632,100	.....	.....

The Mineral Point Zinc Co. shipped 60 cars of calcined zinc ore to DePue, the best month's showing made in years. During the month it received 142 cars of local production, while a heavy tonnage was received from the far western states, and some ore from Mexico entered this port. The gross output of raw ores from mines for the month aggregated 22,152,480 lb., and net refined ores from separating plants to smelter and from mines to smelter, 15,491,790 pounds. Miners were in demand all over the field, shovelers receiving $3 to $5 per day, and enough men could not be obtained even at those wages.

The principal ore buyers were as follows: Mineral Point Zinc Co., 5788 tons; National Separating Works, Cuba, 2292 tons; Grasselli Chemical Co., 1103 tons; Empire Roasters, Platteville, 955 tons; Illinois Zinc Co., 788 tons; American Zinc Co., Hillsboro, 642 tons; M. & H. Zinc Co., LaSalle, 559 tons; American Metals Co., 290 tons; Campbell Separators, Cuba, 120 tons; and Linden Zinc Co., 43 tons.

NEW YORK

THE SPELTER SITUATION AND MINES.—ANACONDA FINANCES DISSECTED.—NEW CORNELIA MINE.—LAKE COPPER MINES.—SUNDRY NOTES.

The spelter situation continues to be the all-important feature in metals. Some of the producing concerns are enjoying a gala day, especially the Butte & Superior. The resumption of mining operations took place just about the time the market started to move up. The Butte & Superior ores go to Bartlesville, Oklahoma, from the concentrator, and settlements cannot be made until assays have been checked and agreed. This requires from four to six weeks, consequently the Butte & Superior got a large advantage in its first settlements after production was resumed. The market climbed nearly every day, to the substantial benefit of the Company, and it is making about $500,000 per month, and some 'extra' dividends may safely be anticipated. When the Butte & Superior resumed, its operations were larger than before. Notwithstanding February being a short month, there was mined 39,310 tons of ore, 2000 tons better than the best month in its history. The recovery of refined zinc is estimated at 13,000,000 lb. The famine in spelter grows worse; owners of spot metal can get their own price. Bids for May delivery in London are 9.50c. per lb., while the market on this side is anything from 9.25 to 10.50c., depending on delivery date, and 10.70 is said to have been paid for some spelter, Youngstown, Ohio, delivery. The zinc mines of this country are not, however, to have everything all their own way. The large Australian mines, no longer able to send their concentrates to Germany and Belgium, are seeking a market in the United States. It is stated that the American Metal Co. has purchased 40,000 tons of concentrates, and the New Jersey Zinc Co. a smaller consignment. The Butte-Duluth property, which is looked on as a possible zinc producer, its lands being almost surrounded by those of the Butte & Superior, and which has been under option to the Anaconda, is now under option to new interests. The Anaconda allowed its right to purchase to expire last week. It is stated that the new possible purchasers are connected with the Butte & Superior, though this is not wholly authoritative.

The sale of the United Metals Selling Co. by the Amalgamated Copper Co. to the Anaconda has resulted in a flood tide of figures working out the readjustment of the two companies. Amalgamated owns 3,070,784 shares of Anaconda, 150,000 shares of Inspiration, 30,800 shares of Greene Cananea, and $1,000,000 of bonds of the Butte, Anaconda & Pacific Railroad Co. The dividends received from Anaconda, and the interest received on the bonds of the railroad company comprise the entire present sources of revenue for Amalgamated. The capital liability of the Anaconda has been increased by about $27,500,000—$9,000,000 for the International Smelting & Refining Co., purchased early in 1914, at which time there was also provided $2,500,000 for new construction work for this refining company; now $12,500,000 for the United Metals Selling Co., and $3,500,000 for improvements. It becomes at once a question as to what the Anaconda received for this increase in liabilities. At the time the smelting company was acquired it was figured that in cash and quick assets it brought into the Anaconda treasury approximately $7,000,000, leaving the net liability incurred at about $4,000,000. The earnings of the International have always been large enough to justify the assumption of the liability which Anaconda took on at that time. The present purchase of the United Metals Selling Co. involved the issuance of notes to the amount of $16,000,000, which is largely offset, however, by the quick assets received in the deal. Anaconda gets 141,900 shares of its own stock, at the present market worth $3,500,000. Since 1910 the selling company's reports have been thrown in with those of the Amalgamated Copper Co., but at the close of that year the Selling Company had about $7,000,000 quick assets, without counting the stock of the International, which latter now comes back to Anaconda as its own stock, as just mentioned. It is fair to assume that the United Metals company is in better position now than in 1910, even if only a little improved it would bring to the Anaconda very nearly enough in quick assets to offset the note issue. The saving in commissions on copper, about $400,000, earnings on outside copper handled, say $150,000, plus the saving in dividends on the 141,900 shares of stock, which would be $141,900 at the present rate of distribution, may all be credited to offset the interest on the notes, $691,900, against an outlay of $800,000. Considering the outlook for large earnings for the Anaconda, apparently the moves which are being made are advantageous. The real question remaining is what is to happen to Amalgamated. It is now left without any multiplicity of interests; its speculative features can only be analyzed through a knowledge of what Anaconda may be doing. If it passes into history, its going will create a great opportunity for reminiscence. The February production of the Anaconda was 15,000,000 lb., about 65% of normal.

The problem of leaching oxidized ores is apparently coming in for a continually increasing amount of attention. The Cole-Ryan staff, headed by L. D. Ricketts, is making a serious attempt to devise a successful treatment for the overburden at the New Cornelia. The New Cornelia is to be a steam-shovel property. Drilling has proved 40,000,000 tons of 1.5% ore with a large percentage of drill-holes stopped in ore. There will be some financing required, but just how it is to be done has not yet been determined. In the matter of processes, there is some thorough work going forward in preparation for the next hearing of the Minerals Separation company against alleged infringers of its patents, and some important developments are said to be quite probable. These matters are quite apart from the problem being worked out in the Lake region for the treatment of old dumps. It may be expected that, with all the energy that is being expended, there will be devised a way for the profitable treatment of the various dumps in the copper country, the metal content of which is well known, and which are very largely in position where they can be rehandled cheaply. The Calumet & Hecla is selling all of its present production to domestic consumers. The Houghton refinery of the Calumet & Hecla installed this week one large dipper to do the work of eight smaller ones in pouring molten copper into the molds.

There is a good deal of activity among the Boston coppers. South Lake, one time the sensation of the list in Boston, is about to do some new financing; an offering of treasury shares to the stockholders is anticipated. Indiana, a neighbor of the South Lake, is doing some exploring underground in an attempt to find its famous No. 2 drill-hole. This drill-hole was one of the factors that helped South Lake sell above $90 per share when it 'sky-rocketed,' some years ago.——The Winona has been making money recently, although not operating. When the war broke out the Winona had some 600,000 lb. of refined copper on hand. It still has the metal, but it is worth 15c. today and shows a handsome profit over carrying charges as compared with the price for which it could have been sold when it went into storage.——The Baltic mine of the Copper Range Consolidated is producing the richest 'rock' ever mined by an amygdaloid mine in the Lake region, averaging for three months 30 lb. of copper per ton.

There was a time when Nevada-Utah was a name to conjure with in the New York mining markets; now the traders, save a few old-timers, would not recall it as a one-time big leader, handled by Lawson in his most spectacular manner. Even the old-timers would tell you it was dead; but dispatches state that the property is shipping 42% zinc ore to the Pueblo smelter. In the meantime the Lawson followers have been liquidated out very thoroughly.

There is being so much done in the way of readjustment that it is bewildering at times, and to some of the older

people some of the movements must seem to be born of outlawry. London is being assailed in many ways to take away various trade privileges long enjoyed, in the matter of metal quotations, London has always made quotations for the rest of the world. Now Berlin, through the 'elders of the merchants' is resolving to make independent quotations on zinc, lead, aluminum, and antimony. Heretofore, notwithstanding Germany's pre-eminence as a producer and a consumer of zinc, the price for the metal has been fixed in London.

BOSTON

Goldfield and Boston.—The Tirbircio Gold Mining Co., Calumet & Montana Consolidated Mining Co., and Fortuna Mines Corporation.—Anaconda and Butte-Duluth.—The Banker Mine.

There is a disposition on the Boston Curb at present to 'quarantine' Goldfield, as buying stocks there seems to be buying into litigation. It is thought here that a general apex fight is to start which bids fair to equal the long-drawn-out contentions which raged at Butte several years ago. This is unfortunate, because Boston had begun for the first time in its history to take some real interest in the Goldfield share market. Thereby hangs some history concerning Goldfield Consolidated. A few years ago, when that property was paying large dividends from high-grade ore, one of the leading Boston porphyry copper capitalists was a member of the board of directors, but became involved in an acrimonious war of words with the president of Goldfield Consolidated at a meeting in the Waldorf hotel in New York, so the story goes. As a result the Boston copper man withdrew from the board, and it appears that on account of his resignation a large amount of Boston activity and influence was thereafter alienated from Goldfield's premier mine. Since then the Boston man has been active in bringing out various low-grade copper and gold properties, but "never again" was he to be identified with a high-grade one. Little differences, like that between the actual and potential length of Cleopatra's nose, frequently change entirely the course of history. Boston still refuses to yield to treatment in Goldfield excitements, being still joined to the coppers, letting New York take the lead in making a market for the Goldfield, Tonopah, and Cobalt issues.

New England interests owning large blocks of shares in the Tirbircio Gold Mining Co. are making a strong effort to finance the installation of a cyanide plant and put the mine on a producing basis. The property is situated near La Plata, Colorado, 17 miles from Durango. There are about 400 acres of lode and placer claims, with about 1500 ft. of adits driven, exposing a mineral zone which the friends of the Company claim contains 5,000,000 tons of ore averaging about $6 per ton, which can be mined and treated at a profit of $2 per ton. Approximately $350,000 has been spent, it is stated, in the purchase of the property and its development and equipment. The latter includes a 1000-ton capacity rock-crusher, from which ore is delivered by gravity tramway to a 50 and 10-stamp mill, a distance of 4000 ft. Water rights on the La Plata river, owned by the Company, are said to have a value of $150,000. Henry C. Demming, geologist, Harrisburg, Pennsylvania, has made favorable reports on the property, and says it will take over 50 years to exhaust the mine. It is expected that Mr. Demming will become locally identified with the Company, which intends to operate as a mining and custom mill concern.

Shares of the Calumet & Montana Consolidated Mining Co., formerly known as the Dark Horse, in the Bitter Root mountains on the divide between Montana and Idaho, have been listed on the Boston Curb for trading. The Company is a reorganization of the Calumet & Montana Mining Co., which went into bankruptcy a few years ago. The revival of the property is influenced principally by the certainty of the building of the Boston & Montana Development Co.'s railroad, the Southern Montana, from Divide, Montana, on the Oregon Short Line, to Jackson, Beaverhead county, Montana, which will place these mines within shipping distance of a railroad. It is expected that the Southern Montana, when completed to Jackson, will be extended across the Bitter Root range on its way to the Pacific Coast, crossing at or near the Dark Horse property. This consists of 228 acres. Ernest Le Duc, a Duluth mining engineer, has examined it, and recommends that it be put on a producing basis. I. Grettum, of Duluth, is president of the reorganized Company.

Active trading in the shares of the Fortuna Mines Corporation has taken place since listing on the Boston Curb here recently. The Company owns the old Fortuna mine, in the Fortuna district, Yuma county, 22 miles southeast of Yuma, Arizona, at the foot of the eastern slope of the Gila range. The general manager is Frank B. Keever, and consulting engineer, T. C. Woodworth, both of San Francisco, who are now in Boston in the interest of the Company. The president and treasurer, F. E. Boland and Frank B. Hobbs, are both San Francisco men. The eastern office is 31 State street, Boston, and the western office is in the Sharon building, San Francisco. Associated with the management will be Fred J. Martin, superintendent of the Utica mine, Angels Camp, California, who operated the Fortuna 20 years ago for the late Charles D. Lane, during a period of eight years, in which the mine produced $3,000,000 in gold and paid dividends of $1,180,000. This profitable career was interrupted 10 years ago by a cross fault, and after spending $500,000 trying to locate a continuation of the vein, the old owners decided to part with the mine, and the present Company acquired it. The story now is that, after spending $100,000, the present management has recovered the vein on the opposite, or south, side of the fault, the only place where the former management had not looked for it. The Company has a capitalization of 500,000 shares, par $1, and began trading here at $1.25, afterward advancing to over $2. Ex-governor Foss is a large stockholder.

Surprise is expressed here at the Anaconda company failing to take up its option on the Butte-Duluth properties of A. B. Wolvin, but the failure is said to be a matter of a difference in price only, Anaconda bidding $1,000,000, and Wolvin holding out for $1,500,000.

Ray J. Barber, a mining engineer from Boston, is now in Leadville, Colorado, with associates for the purpose of resuming operations at the Banker mine, situated on the western slope of Breece hill, about three miles east of the business centre of Leadville. It is understood that the mine is to be unwatered to the 350-ft. level, on the theory that the former management uncovered a rich body of ore in driving from that level, and kept the discovery secret. This mine was active until the death, 12 years ago, of John Duth, of Leadville, who had entire control of the property. It is said that over $200,000 has been spent in developing and equipping it, sinking a shaft down over 1000 ft. When the Yak drainage tunnel was being driven, it would have passed directly through the Banker property, but Mr. Duth would never consent to this being done, although it would have resulted in cheap drainage, power, and transportation to the mines, without any additional cost. On account of his attitude the tunnel course was deflected, and now runs about 90 ft. south of the end-line of the Banker property. Some of the old stockholders claim that Duth's opposition to the tunnel passing through the property was based on his fear that in this way underground conditions would become a matter of outside knowledge. The property was sold for taxes a few years ago, and was bid in by G. Johnson Rittenhouse, of Los Angeles, who became sole owner. It is stated that there will be at least $200,000 spent on reopening the mine by Boston capitalists.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

Juneau

January returns from the mines on Douglas island were as follows:

Details of operation.	Alaska Mexican.	Alaska Treadwell.	Alaska Ready Bullion.	United. 700-Ft. Claim.
Development, feet	185	912	890	349
Stock of broken ore, tons.	12,422	47,128	+ 4,348	- 14,639
Stamps working	120	540	120	120-150
Ore crushed, tons	18,865	75,488	19,684	23,940
Gold by amalgamation	$20,015	$75,971	$24,965	$30,021
Concentrate cyanided, tons	402	1,613	433	534
Gold from concentrate	$21,806	$70,355	$19,360	$28,149
Total realizable value	41,402	144,863	43,882	57,589
Operating expenses	23,193	83,221	27,309	24,274
Construction	3,955	12,488	4,903	2,905
Net profit	$14,255	$49,154	$11,669	$30,409

At the 700-Ft. Claim, 30 stamps worked from January 10 to 31, inclusive, making 150 in all. On February 26, steam power at the Ready Bullion mill was changed to electric motors, although the former plant is still supplying steam for the hoist and compressor, which will be electrified this year.

ARIZONA

Cochise County

A drill-hole from 1800 ft. in the Junction mine of the Calumet & Arizona, at Bisbee, passed through 35 ft. of good sulphide ore some time ago. The hole was in the direction of the American-Saginaw claims, purchased over a year ago. The upper levels, above 1000 ft., of the Irish Mag claim have been leased to miners.

Maricopa County

The annual meeting of the Monarch Mining & Smelting Co. was held at Wickenburg on January 27, when directors and officers were elected. The president, J. H. Mulholland, stated that in March 1914, the Company was heavily in debt and the mine shut down. Of the $50,000 paid by him and associates for 750,000 shares, less than $225,000 was available for mine development. A 100-hp. Fairbanks-Morse gas engine for general power purposes, a 12-hp. engine of the same make for the concentrating floor drive, electric lighting plant, another set of rolls, and a table were purchased. These installations took four months. The property had a good surface showing of copper ores, but development proved them to be irregular in formation. Any profit in this ore was doubtful. In June 1914 it was decided to raise the capital of the Company from $1,500,000 to $3,000,000; but the war started, affecting the copper and money markets. Eventually $20,000 was secured to proceed with development until next October or November. At December 31, 1914, the real assets showed a balance of $62,523 over liabilities, other than capital stock.

Mohave County

The Golconda mine is being opened at 800 ft., and the shaft is to be sunk to 1000 ft. as soon as possible. Rich zinc ore is showing in the new level.——Six feet of zinc ore was cut recently in the Columbus mine at Cerbat. At present it is being piled on a dump.——It is reported that the Arizona Western Mines Co. is to sink to 500 ft. and open the gold-silver-lead and zinc-lead deposits on its ground in the Chloride district.

CALIFORNIA

Calaveras County

Twenty stamps are to be added to the existing 100 head at the Melones mine at Angels, while four miles of fluming is to be repaired this summer.

Eldorado County

Some rich ore has been found again in a pocket of the Jones mine at Ringgold, which is bonded to N. Judson. Several similar bonanzas have been opened during the past few months.——A valuable deposit of molybdenite is reported to have been opened by Y. A. Murray on the road to Grizzly Flat.

Kern County

At Johannesburg, the Phoenix Mining Co. has a shaft down 300 ft. on the incline, and total development amounts to 2500 ft. A wide vein is being opened. Lessees have 15 men em-

JOHANNESBURG, KERN COUNTY, CALIFORNIA.

ployed. Equipment consists of a 10-stamp mill and a 25-ton cyanide plant. A dump of 38,000 tons of tailing is to be treated.——The Atolia Mining Co., five miles south of Randsburg, a producer of tungsten ore, has decided to grant new leases, subject to 60 days' notice.

Nevada County

On March 7 the incline rise from 2490 ft. in the Champion mine was connected with the 1000-ft. level, constituting one of the best underground feats of the district. The rise makes good ventilation throughout the Champion mine, and will aid development greatly. A winze was started from 1000-ft. to meet the rise, and connection was excellent. Time taken was over a year.

The North Star company, which owns the Champion and Providence properties, is to enlarge the Providence shaft down to 1800 ft., and install a large electric hoist and erect a head-frame. After this is done, the shaft will be sunk deeper. At present the Champion shaft is mostly used for hoisting ore and supplies, and this new arrangement will relieve the pressure at that point.——Fifty cars of gravel awaiting washing at the Goodwin mine at You Bet was washed by thieves, who also cleaned up at the sluice-boxes. It is estimated that $2000 was stolen.

Placer County

The Rough and Ready gravel mine at Dutch Flat has been acquired by the newly formed Federal Drift Mining Co. of San Francisco. A plant of 250-ton daily capacity is to be installed.

PLUMAS COUNTY

A caterpillar tractor of 40-ton capacity is to be used by the Engels Copper Mining Co. to haul supplies to the mine and concentrate to the Western Pacific line at Keddie, a distance of nearly 40 miles. It is estimated that freight will be reduced from $11.50 to $2 per ton by this means.

SHASTA COUNTY

The Noble Electric Steel Co. will probably resume production of pig iron and ferromanganese in April. ——At the Bright Star, near Stella, the shaft is being sunk to 170 ft. A 5-stamp mill is to be erected at once.

Thirty-five tons of flint pebble from Europe is being sent from Redding to the Globe mill at Dedrick, Trinity county, in 50-lb. sacks, by parcel post. The reason of this means of transport is on account of the bad roads.

SIERRA COUNTY

The rich shoot cut in the Kate Hardy mine continues to open satisfactorily.——The Tightner company at Alleghany has started sinking a large shaft. Rich ore is still being extracted, and the 20-stamp mill kept busy.

SISKIYOU COUNTY

At Happy Camp the Reeves-Davis placer claims have two giants at work. Recent storms damaged the ditches to some extent.——The Siskiyou Mines Co. has three giants sluicing. ——The district is generally busy.

SONOMA COUNTY

Directors of the Sonoma Magnesite Co. have discussed preliminary plans for the erection of a plant to manufacture by-products, such as precipitated magnesia for firebrick, magnesite stucco for imitation marble, ornaments, and calcined magnesite materials. The 13-mile narrow-gage line from the mines to the Northwestern Pacific, north of Guerneville, will be in operation in a few days. Chicago capital is interested in this concern.

TRINITY COUNTY

On Rush creek, near Weaverville, the Rush Creek Gold Mining Co. is planning more extensive work on its 22 gravel claims, and is enlarging its ditches and flumes. M. E. Eastman is general manager.

TUOLUMNE COUNTY

The White Lead gravel claims near Columbia have been acquired by C. M. Belshaw, C. C. Gross, and J. M. Jackson, and extensive work is planned.

COLORADO

LAKE COUNTY (LEADVILLE)

All is in readiness at the Penrose pumping shaft for the new pumps. A large tonnage of zinc carbonate and sulphide ore is being mined from Yankee hill.——A large body of carbonate has been opened in the upper levels of the Wolftone. ——The Banker mine on Breece hill is to be reopened this spring. One method of drainage would be a connection with the Yak tunnel.——Denver people have leased the Jennie June claims in the East Tennessee district, and four feet of gold ore has been cut.

OURAY COUNTY

The Camp Bird company reports as follows for the last quarter of 1914: development, 688 ft.; stoping, 93,920 cu. ft.; ore broken in stopes, 20,345 tons; ore treated, 8882 tons; revenue from bullion and concentrate, $246,916; net profits above all expenses in Colorado and London, $120,000; and profit from Santa Gertrudis company of Mexico, $115,000. It is not considered that during the period ore developments added to profit reserve of consequence.

TELLER COUNTY (CRIPPLE CREEK)

The gold output of this district in February is estimated as $1,355,661 from 72,100 tons of ore.——At the Midget mine the shaft is 900 ft. deep and it is proposed to sink 100 ft. further when the Corundum vein should be cut. The February output was 2+ cars of ore. The Company is to spend $15,000 on development and plant. J. F. W. Doepke is manager. ——Three feet of $60 ore has been opened in the Wreck Lode claim on Bull hill.

The Golden Cycle Mining Co.'s properties have been acquired by the Vindicator Consolidated company for $4,500,000 cash, the principals in the transaction being John T. Milliken, A. E. Carlton, E. P. Shove, and others. This will settle the litigation between the two companies, involving $1,000,000.

About 200 tons of ore worth $500,000 was sent from the Cresson mine to the Globe smelter at Denver, but as there was a large difference between the assays, the lot is to be treated in a special run at the Golden Cycle mill at Colorado City.

IDAHO

SHOSHONE COUNTY (COEUR D'ALENE)

On April 1 the Interstate-Callahan Mining Co. will pay a dividend of 25c. per share, amounting to $115,000. The directors have decided to distribute this each quarter. The gross earnings from the shipment of 150 tons of crude ore and concentrate daily to the smelter are about $500,000 per month. There are 155 men employed at present. J. H. Robbers is general manager. In the Idaho mineral display at the Exposition at San Francisco is a piece of Interstate ore weighing about 3800 pounds.

Renewed interest is being taken in the Big Creek lead-silver district, especially since milling ore was opened in the Magnee claim. Transportation facilities have held back development of the area. Over $50,000 has been extracted from the Yankee Boy mine in the past three years. One of the largest properties is that of the Liston Mining Co., in charge of Matt Baumgartner. An adit has been driven 2600 ft., of which 600 ft. has been on a wide vein. Other work has been done on the Big Creek, Western Star, Blue Bell, Bunker Hill Extension, Rockford, Coeur d'Alene Central, and Bismarck claims. Road construction has occupied miners on the west fork of the creek.

Nine feet of lead-zinc ore has been opened in a rise from 2200 ft. in the Frisco mine at Gem. All work had been concentrated on this rise, but the whole mine will be reopened about April 15. The mill, with a flotation process recently installed, will be ready by that time.

In the suit of the Ontario Mining Co. *v.* the Stewart Mining Co., Judge Flynn on March 2 decided in favor of the former for $48,245, holding that the trespass existed from January 20, 1914, to September 2, 1914, and estimates the amount of ore taken out as about 70,000 cu. ft., 10 cu. ft. to equal one ton. He decided that the trespass was partly innocent and partly wilful, and divided the ore removed into two groups. The wilful trespass was set at 46,662.75 cu. ft., while 24,030 cu. ft. was taken innocently.

MISSOURI

JASPER COUNTY

The output of the Missouri-Kansas-Oklahoma district during the last week of February was as follows: blende, 7,015,260 lb.; calamine, 1,743,700 lb.; and lead, 1,301,970 lb., making the nine weeks' total of 85,591,490 lb., 7,226,580 lb., and 12,979,620 lb., respectively, worth $2,948,181. Principal district outputs were:

District.	Blende.	Calamine.	Lead.
Joplin	1,221,230	76,160	235,430
Webb City-Carterville	2,241,390	.....	606,410
Alba-Neck City-Purcell	.....	665,880	.....
Oronogo	574,230	.....	79,050
Duenweg	468,270	.....	21,320
Galena	662,110	.....	57,070
Miami	378,510	.....	.....
Granby	90,640	1,422,860	48,270

ST. FRANCOIS COUNTY

The annual meeting of the St. Joseph Lead Co. of Flat River was held on February 15, and Robert Holmes has issued a 22-page circular on the Company's affairs. The vote for directors resulted in the election of the administration ticket, which received 1,031,640 shares, and 229,282 shares for the opposition

MAP OF THE FLAT RIVER LEAD DISTRICT, MISSOURI.

ticket. The former vote was a decrease of 187,851, and the latter a gain of 16,370 shares over last year. The discussion of the Company's connection with the Doe Run Lead Co., Farmers & Miners Trust Co., and others, is so mixed that a full study of the pamphlet is necessary to grasp it.

MONTANA

It is proposed to organize a Montana branch of the American Mining Congress, and H. S. Taylor has started canvassing in Granite county.——The Montana Power Co. sells current for light and power to 28,500 consumers in this state for domestic, industrial, mining, and railroad purposes. Net earnings in 1914 amounted to $2,639,239.

JEFFERSON COUNTY

The old Clancy district contains many lodes carrying zinc, and there is a revival of interest in the properties, including the Hope, Joe Garneau, and Clancy.

POWELL COUNTY

The Nigger Hill silver-lead district, eight miles south of Elliston, is shipping ore from the Black Jack, Democrat, Nystrom & Co.'s lease, Carbonate King, and Big Dick, in which considerable work has been done.

SILVERBOW COUNTY

It is reported that the American Zinc Co. has leased the old Emma mine in Butte county from the owners, the Butte Copper & Zinc Co. Good zinc ore had been developed at 800 ft., with about 2% copper.

NEVADA

ESMERALDA COUNTY

The estimated production of the Goldfield Consolidated company for February is as follows: Ore mined, tons, 29,864; gross extraction, $340,000; operating expenses, $168,000; and net realization, $172,000. According to the secretary, A. H. Howe, rumors that the Company is likely to be mixed up in litigation with the Reorganized Booth company over apex rights are not true, an agreement having been made last December whereby the Consolidated was given a release from liability for past ore extraction and the right to continue to mine within its vertical boundaries. The Consolidated has leased part of its Grizzly Bear mine, from 1400 ft. down, to the Atlanta company. In the Booth-Jumbo Extension suit, it has been arranged that the latter Company can resume work in a few days. According to the report of the Extension for the last quarter of 1914, the production was 5658 tons of ore valued at $74.37 per ton. Extraction cost $3.01 per ton, totaling $16,513. Development amounted to 1406 ft., at $9.03 per foot, or $12,702. Net profits were $255,020. Dividends totaled $100,396. In January there was 1572 tons of ore shipped worth $67,873, of which $41,328 was profit.

The Florence Goldfield Mining Co. held its annual meeting last week. The output was 8029 tons of ore worth $211,859. Operations cost $140,428. On December 31, 1914, the cash balance was $124,793. The manager, Harry B. Clapp, stated that development totaled 2601 ft. at $4.35 per foot. The cost of stoping and delivering ore in railroad cars was $1.29 per ton. It was previously decided to sink the main shaft from 1270 to 2000 ft. to cut the latite-shale contact, but this is to be postponed. To try to prove its apex rights in the Jumbo Extension suit, the Booth company has started sinking an incline shaft on the vein, 400 ft. south of its present shaft.

LINCOLN COUNTY

Control of the Prince Consolidated at Pioche was recently obtained by Godbe Bros. of Salt Lake City, and M. C. Godbe has been examining the property. The mine never looked so promising as at present, and the daily production is 475 tons of ore.

NYE COUNTY

Seven mines at Tonopah produced 10,408 tons of ore, worth $213,304, during the first week of March.——Renewed interest is being taken in the western area of the district since the important development in the Monarch-Pittsburg mine, and it is reported that the Tonopah Mining Co. is taking over 16 or 18 claims nearby. In the Monarch-Pittsburg the crosscut is out over 80 ft. in the formations cut, with no foot-wall in sight. Assays have shown irregular values.——Arguments by counsel in the Jim Butler-West End suit started March 8.

UTAH

BEAVER COUNTY

Thirty per cent zinc ore is being shipped from the Cedar-Talisman in the Star district. S. S. Pond is in charge.

Twenty-three iron-ore claims near Newhouse have been relocated by L. P. Palmer, T. Marioneaux, S. H. Taylor, and L. Hall of Salt Lake City. A large vein of smelting flux, containing 50% iron and $3 to $5 gold per ton is included. It is low in silica. At present the ground is covered with snow, but work will commence in the spring.

In the Leonora mine, in the Star district, high-grade zinc ore is to be shipped in a few days. The silver-lead shoot has been opened for 195 ft. A. C. Nebeker is superintendent.

JUAB COUNTY

Ore shipments from Tintic in February only totaled 297 cars, compared with 430 in January, although the latter month included five weeks. Storms, shortage of power and water, and low silver contributed to the decrease in February.——Lessees in the Yankee Consolidated are shipping high-grade zinc ore, seven of the nine sets working in this ore. On account of bad roads the zinc ore from the May Day is held up.

SALT LAKE COUNTY

Since 1910 the Cardiff mine has yielded $100,550 net from 3340 tons of ore. The property has been opened to 300 ft., and there has been 5085 ft. of development accomplished. The Cardiff Mining & Milling Co. has been listed on the Salt Lake

Stock Exchange.——The Montana Bingham company's tunnel is in over 3600 ft., two machines advancing about 5 ft. per day. The flow of water is 200,000 gal. per day. Some important developments are expected shortly. The following properties expect to use the tunnel for mining purposes and cheaper transport of ores to the railroad: Montana Bingham, Bingham Amalgamated, Bingham-Consol, Keystone, Extension, and Fortuna. By driving to the south, the tunnel will also cut the orebodies in the Starless mine, where it is said that about 1,000,000 tons has been blocked out.

SUMMIT COUNTY

The annual meeting of the Silver King Consolidated Mining Co. was held in Salt Lake City on February 27. Solon Spiro was reelected president and general manager. Ore sales totaled $346,990, and total revenue in 1914 was $797,884. Cash on hand and cash loans on January 31, 1915, were $61,266 and $141,131, respectively. The Spiro transactions were discussed. Development in the mine totaled 10,127 ft. Owing to the metal market, production was stopped after the war started. Prospects at 1700 and 1800 ft. are good.

The ore production of Park City in February totaled 8517 tons, the heaviest in over a year. The mines contributing were as follows: Silver-King Coalition, 4034; Daly-Judge, 1855; Daly West, 1778; and Silver King Consolidated, 850; a total of 8517 tons.

WASHINGTON

FERRY COUNTY

(Special Correspondence.)—During the past week meetings were held in Republic by the miners and business men of the district, discountenancing irresponsible mine operators, and urging prompt pay-days. The outcome was the appointment of committees, to act jointly as an investigating and advisory board, whose principal duties will be to ascertain and report as to the responsibility of operating companies. On adjournment of the last joint meeting of the miners and merchants (not the committees), the business men remained and took steps to organize a business men's club. Behind all is the moral support of the community.

The Ben Hur mine is now producing good ore from the stope north of the shaft above the 200-ft. level.——G. C. Taylor, assayer at Republic, has received a letter from the Consolidated Mining & Smelting Co., Trail, British Columbia, stating that the Canadian tariff does not apply to any kind of ore.

Republic, February 26.

OKANOGAN COUNTY

(Special Correspondence.)—Inquires are being made about a story said to have been published in *The Chicago Examiner* relative to a mine in the Adirondack lode for which one F. A. Mabee and his wife are reported to have refused $10,000,000. The property referred to, from a story printed in *The Okanogan Independent*, is in Sheridan district, just over the Ferry County line, in Okanogan county. One W. R. Foley, alleged to have been connected with the deal, is said to have skipped out, a defaulter to the amount of several thousand dollars.

Republic, February 26.

The Golden King Mining Co. has announced that construction of a mill will be started next month on its property, which is near Oroville. Work has commenced on a 4 to 10-ft. vein which assays from $6 to $8 per ton.——The Golden Zone company, in the same district, is driving a 1400-ft. adit. The management is planning to enlarge the present mill, which has not large enough capacity.——The Ivanhoe people are driving a 4000-ft. adit and some ore has been cut, but there is about 1600 ft. yet to go before cutting the main orebody.

The mining department of the state college has agreed to investigate and make a public report on the proper metallurgical treatment for the low-grade silicious silver ores of the Okanogan country.

STEVENS COUNTY

Spokane people, including J. L. Harper of Republic, are negotiating to acquire the Copper King mine, at Chewelah, for $300,000.——A flotation plant has been ordered for the United Copper company's 150-ton mill. Conrad Wolfe, of Spokane, is president of the Company.

CANADA

BRITISH COLUMBIA

Ore is soon to be shipped from the Rocher de Boule mine near Hazelton, and an output of 100 tons of 12% copper ore is expected to be maintained. A 3½-mile aerial tramway connects the mine ore-bins with the Grand Trunk railroad to Prince Rupert. Adits have opened four extensive shoots. J. E. Oppenheimer, of Butte, B. Binnard and John F. Cowan, of Salt Lake City, control the Company.

ONTARIO

Ore shipments from Cobalt in February amounted to only 996 tons, the lowest in seven years. The power shortage was mainly responsible for this low tonnage. Bullion shipments during 1914 totaled 9,624,629 oz., according to A. A. Cole, mining engineer for the Temiskaming and Northern Ontario Railroad Commission.——On April 3 the McKinley-Darragh company will pay 3%, equal to $67,431, making 199% and $4,722,140 to date.——A Cobalt mine's surface magazine, containing about 5000 lb. of powder, narrowly escaped being blown up last week, a fuse having been laid by some miscreant, but went out near the cap.——The Nipissing Mines Co. has temporarily ceased work on the Teck-Hughes property. The Company has an option on the property, which is controlled by the Great Northern Silver Mines Co.——On account of the power and silver situation, the Trethewey mine and mill have been closed indefinitely, putting 100 men out of work.

The Dome mine in January produced 23,220 tons of ore averaging $3.56 per ton.

YUKON

The Yukon Gold Co.'s output in 1914 was valued at $4,307,000, of which $3,143,000 was from the Dawson district, against $3,600,068 in 1913. The net profit was approximately $1,500,000.

MEXICO

BAJA CALIFORNIA

(Special Correspondence.)—Everything is quiet in this part of Mexico, but at times the people suffer inconvenience from scarcity of supplies and news, due to the irregularity of the steamers. The new governor, General Ortega, recently issued a decree for all people here, including foreigners, to deliver any and all firearms they may have to the government. Export duties have been materially increased. The export duty on gold bullion, including other attendant fees now comes to about 10 per cent.

La Paz, February 28.

HIDALGO

The Santa Gertrudis company reports as follows for the last quarter of 1914: ore treated, 64,429 tons; bullion produced, $370,000 (U. S. gold); and profit at the mine, $160,000. On account of the scarcity of supplies the treatment capacity was reduced from 85% in November to 40% in December. Work was not hampered by political occurrences. In the upper part of the mine, development totaled 1663 ft., of which 1146 ft. was in average low-grade 'pay' ore. Generally the work was very satisfactory. It was again necessary to repair the timbering of San Guillermo shaft where it passes through the vein. In connection with vein No. 8, a hanging-wall orebody was developed on No. 9, 11, 13, and 14 levels, where it was from 60 to 80 ft. long, and averaging 30 ft. in width. Further work on No. 9 level shows it is worth $13.20 per ton; No. 11, 31 ft. wide and $35.88; No. 14, 13 to 47 ft. and $22.54 to $26.76 per ton.

PERSONAL

Francis Drake has left Buluwayo for Capetown.

Oscar Hershey was in San Francisco during the week.

C. H. Benedict is spending a holiday in San Francisco.

Clifford Dennis was in San Francisco early in the week.

W. J. Loring has gone to visit mining properties in California.

O. E. Kirkpatrick, of Leesburg, Idaho, is in San Francisco this week.

J. H. Bigger has returned to Tampa from an extended trip through Honduras.

H. V. Winchell and J. R. Finlay will act as experts for the Jumbo Extension Mining Co. in litigation at Goldfield.

W. D. Blackburn, who has recently been assisting George H. Garbly on work in the Tonopah district, is now in Texas.

Thomas M. Skinner, Jr., has moved from Red Cliff, Colorado, to Keeler, California, care of the Inyo Development Company.

L. Ferdinand Johnson has returned to San Francisco from Sierra county and will be at 953 Monadnock building until May 1.

A. M. Yonge is spending a holiday in the United States and expects to pass through San Francisco early in April, returning to Costa Rica.

Leo Von Rosenberg has left the Ray district of Arizona for the Cripple Creek district, Colorado. He will be in New York by the end of March.

L. O. Kellogg, formerly on the editorial staff of *The Engineering and Mining Journal*, is now associate editor of *The Engineering Magazine*.

C. R. Olson, recently of Aurora and Tonopah, Nevada, has been appointed mill superintendent for the Pittsburg-Dolores Mining Co., Rockland *via* Yerington, Nevada.

Frank M. Leland, general manager for the Balaklala Consolidated Copper Co., at Kennett, California, has been appointed general manager for the Trinity Copper Co. also, the claims of which are adjoining.

F. McN. Hamilton was recently in the Nevada City and the Grass Valley districts, California, visiting the mines. Errol McBoyle, also representing the state mineralogist's office, spent several months in Nevada and Sierra counties during the past year.

At the Canadian Mining Institute meeting at Toronto the following officers for 1915 were elected on the third day: President, G. G. S. Lindsey, Toronto. Vice-presidents, Thomas Cantley, Sydney, Nova Scotia; A. A. Cole, Cobalt, Ontario. Councillors, M. B. Baker, Kingston, Ontario; J. W. Bell, Montreal; R. W. Brock, Vancouver, British Columbia; Theo. C. Denis, Quebec; D. A. Dunlop, Toronto; M. B. R. Gordon, Cobalt; G. C. Mackenzie, Ottawa; D. H. McDougall, Sydney, Nova Scotia; J. T. Stirling, Edmonton, Alberta; and A. J. Young, Toronto.

W. H. Johnston, of Ishpeming, has resigned as general superintendent of the properties of the Oliver Mining Co. on the Marquette range. Mr. Johnston has been actively associated with the Lake Superior Iron Co. and the Oliver Iron Mining Co. for the past 39 years. He became general superintendent several years ago, when the Steel Corporation subsidiary took possession of the Lake Superior Iron Co. Frank E. Keese will succeed Mr. Johnston. Mr. Keese has had wide experience in mining, having worked in all branches of the industry from his youth. He has been closely associated with Mr. Johnston since 1905, when he went to Ishpeming to take charge of the mining operations of the Oliver company's mines under Mr. Johnston.

SCHOOLS AND SOCIETIES

A school of mines is to be started at Tonopah, as the Nevada legislature passed a bill on February 25 to establish the institution.

The Northwest Mining Convention, which was held at Spokane during the last week of February, was pronounced to be "the best ever."

The Sydney (New South Wales) University Engineering Society's *Journal* shows that the total membership is over 320. Papers on surveying, hydraulics, assay plans, and flotation are published.

The University of Wisconsin is to hold an exposition at Madison on March 25, 26, and 27. Exhibits will include a mine model, shaft, drills, concentrating tables, magnetic separator, and assay laboratory.

The Colorado School of Mines, at Golden, will give a course in coal mining, from April 5 to May 28, for which no fees are to be charged. It will consist of mathematics, drawing, chemistry, geology, and mining.

The Scientific Society of the Colorado School of Mines met on February 26, and the following officers were elected: V. D. Howbert, president; C. E. Carstens, vice-president; and F. E. Briber, corresponding secretary.

Alumni and former students of the Michigan College of Mines held a luncheon at the Engineers' Club, New York, during the February meeting of the A. I. M. E. Several interesting talks were made, one by Scott Turner being on mining in Spitzbergen, where he is in charge of the Arctic Coal Co.; and W. L. Cumings on South America, mainly Chile, as a mining country. It is proposed to form a permanent eastern M. C. M. club for those living near New York and those passing through. James Dunstan, of 42 Broadway, is secretary.

The Australasian Institute of Mining Engineers held its annual meeting at Melbourne on January 29. H. H. Schlapp was chairman, and referred to the proposed meeting at Mt. Lyell. Incorporation of the Institute was under consideration. The election of officers to fill the annual vacancies resulted as follows: president, Robt. C. Sticht, Tasmania; vice-president, James Horsburgh, Queensland; council, E. G. Banks, New Zealand; W. H. Corbould, Queensland; C. F. Courtney, New South Wales; H. Lipson Hancock, South Australia; H. Herman, Victoria; Ernest W. Skeats, Victoria; and John W. Moule, Queensland.

Volume I of the *Transactions* of the International Engineering Congress, to be held at San Francisco on September 20 to 25, will comprise a unique series of papers on the engineering of the Panama canal. The various topics and subdivisions of the work have been arranged by Col. G. W. Goethals, chief engineer, and now governor of the Canal Zone. He has also selected the author for the treatment of each paper, and he will himself contribute the introductory chapter. The various authors are in general the officers who were in direct charge of the actual work of construction, and the collection of papers thus becomes a first-hand account of the engineering of the canal. There will be 24 papers in all, profusely illustrated, 22 of which deal with actual constructive and engineering problems connected with the work, one with the preliminary work in municipal engineering in the Canal Zone, and one with the commercial and trade aspects of the canal. This volume would in itself be a valuable acquisition for any person interested in the progress of the world's work, whether or not an engineer, and for any library, whether technical or not. It can be obtained only through enrollment in the Congress. The transactions of the Congress as a whole will include from seven to nine other volumes, covering all important phases of engineering work.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, March 11

Antimony	.20 —20¾
Electrolytic copper	15½ 15¾
Pig lead	4.20 5.15
Quicksilver (flask)	$80.00
Spelter	10¾ -11
Tin	38 39½
Zinc dust, 100-kg zinc-lined cases	12

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK March 11. Copper and lead are firm, but the spelter market is demoralized, buyers holding back and sellers pressing sales, prices ranging from 7.50 to 8.50c. per pound.

COPPER

Prices of electrolytic in New York, in cents per pound.

Exports during the last week of February amounted to 10,171,816 lb., France taking 5,100,874 lb.; Italy, 2,961,038 lb.; and England 1,622,255 lb. Imports totaled 840,002 lb. According to a consular report of February 9, there is a shortage of metal in Sweden. The monthly consumption in that country is 800 tons, and only 762 tons entered in November and December, 1775 tons being held in England. There is about two months' supply for consumers. In February the Anaconda output was 15,100,000 lb., compared with 13,700,000 lb. in January.

LEAD

Lead is quoted in cents per pound or dollars per hundred pounds, New York delivery.

Date		Average week ending

Letters from the Missouri and Wisconsin zinc fields appear on pages 416 and 417 of this issue. The Missouri Kansas-Oklahoma people are greatly perturbed on account of the increase in price of spelter, and decreased prices offered for ore. Instead of $75 two weeks ago, last week's sales were only $66 to $73 per ton.

It is very interesting to learn that the Reed Zinc Co. of San Francisco, with an electrolytic plant about 30 miles south, sold 10,184 lb. of zinc to the Selby Smelting Co. last week. This is probably the largest sale of electrolytic zinc ever made in the United States and perhaps in the world. The plant was described in the 'Press' of January 2, 1915.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending	
Mch.	4 ..... 49.12	Jan. 27	48.77
"	5 ..... 49.25	Feb. 3	48.52

June	56.43	....	Dec.	49.27	....

The silver market has shown decided strength during the week. On March 6 about 300,000 oz. left San Francisco for the Orient. During the first week in the current month the Nipissing shipped 276,709 oz. to London, but the bullion insurance rate to England has been raised from $1.80 to $10 per $1000 of metal, so shipments from Cobalt will be curtailed, and probably diverted to New York, as happened during 1914. Samuel Montagu & Co., of London, writing on February 18, state that the tone of the market continues good, coinage orders for abroad are considerable (Dutch Mint bought 1,280,000 oz.), and the demand for India remains fairly constant.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Feb. 11 ..... 60.00		Feb. 24	62 50
" 18 ..... 62.50		Mch. 3	70.00
		" 10	80.00

Monthly averages.

	1914.	1915.		1914.	1915.
Jan.	39.25	51.90	July	37.50	....
Feb.	39.00	60.00	Aug.	80.00	....
Mar.	39.00	....	Sept.	76.25	....
Apr.	38.90	....	Oct.	53.00	....
May	39.00	....	Nov.	55.00	....
June	38.60	....	Dec.	53.10	....

The quicksilver market is bare of supplies, resulting in the above advance during the week.

TIN

Prices in New York, in cents per pound.

Monthly averages.

	1914.	1915.		1914.	1915.
Jan.	37.85	34.40	July	31.60	....
Feb.	39.76	37 23	Aug.	50.20	....
Mch.	38.10	....	Sept.	33.10	....
Apr.	36.10	....	Oct.	30.40	....
May	33.29	....	Nov.	33.51	....
June	30.72	....	Dec.	33.60	....

Owing to the shipping trouble in England, tin has advanced to as high as 52c., but on March 10 New York prices were 44 to 48c. Large consumers are said to be fairly well supplied for the current month. In their review of tin, dated March 5, L. Vogelstein & Co. of New York, discuss supplies and prices. Several factors will result in higher or lower prices, but there promises to be a period of acute scarcity with high prices for spot metal. The Vulcan Detinning Co. in 1914 had an income of $781,688, about the same as in 1913. Operations resulted in a loss of $74,853, against $214,280. The surplus is $333,912.

COMPANY REPORTS

TOUGH-OAKES GOLD MINES, LTD.

This property is in the Kirkland Lake district, Ontario, and the report is for the calendar year 1914. The small mill treated 3493 tons of ore worth $22.33 per ton, and 213 tons smelted averaged $351 per ton. The total production was $117,644, but a loss of $59,807 was made. A new 100-ton mill is nearly ready for work, and it is complete with all modern processes. According to the manager, C. A. O'Connell, development totaled 1477 ft., and ore reserves above 300 ft. are valued at $1,500,000. In addition, dumps and tailing are worth $160,000. Considerable surface improvements were finished.

PREMIER (TRANSVAAL) DIAMOND MINING CO., LTD.

All diamond-mining companies suspended operations in August 1914, so the report of this Company, whose year ends on October 31, covers work for about nine months. During this time 7,683,943 loads (1600 lb. each) was washed, yielding 1,417,755 carats. Compared with the whole of the previous year, this shows a decrease of 690,228 carats. The stones averaged $4.26 per carat, and the value per load was 78c. Costs totaled 60c. per load. Sales realized £1,259,643, against £2,336,828, and working profit £302,516 compared with £1,003,098 in 1912-13. Unsold diamonds amount to £593,074. Dividends amounted to £190,000.

PORTLAND GOLD MINING COMPANY

The report of the manager, Frank L. Small, of this well known Cripple Creek property, covers the year 1914. Development totaled 15,592 ft., of which 2843 ft. was done by lessees on the 200-ft. level. Drifts cost $6.617, cross-cuts $6.99, rises and winzes $7.77, No. 1 shaft $62.83, and No. 2 shaft $50.78 per foot. Shaft-sinking includes timbering, pipes, guides, wiring, and everything ready for use. On the 1700-ft. level, No. 1 vein has been exposed for 1350 ft., of which 1050 ft. is shipping ore, the remainder suitable for the Victor or local mill. A large amount of prospecting is under way on this level, but a year is required to finish it. Mechanical haulage was started here in October, a 3½-ton storage-battery locomotive being used. Tramming costs have been reduced. A 515-man capacity change-house was completed in December for all employees. It is thoroughly modern.

There was 62,997 tons of ore sent to the Colorado Springs mill, which yielded $1,467,005, including 9955 tons worth $224,952 from lessees. The Victor mill treated 210,132 tons, 18,934 tons coming direct from the mine and 191,198 tons the reject of shipping ore, and from the dumps. This yielded $419,962. The total revenue was therefore $1,886,966, and the profit $577,087. Dividends amounted to $360,000, and the balance on January 1, 1915, was $507,260, including that from the previous year.

Operations to date have resulted in the following: development, 272,779 ft.; ore treated, 2,040,722 tons; gross value, $38,274,933; and dividends, $9,817,080.

NEVADA HILLS MINING COMPANY

This Company's property is in Churchill county, Nevada, 40 miles from the railroad, and with only fair labor conditions, yet operating costs totaled only $5.66 per ton. The net profit for 1914 was $67,036, but the president, George Wingfield, does not consider that a dividend should be paid at present.

The general manager, E. A. Julian, makes the following remarks: Operation during the year was continuous. Mine development amounted to 5697 ft., at a cost of $8.15 per foot for driving and cross-cutting, $6.30 for rising, $15.27 for winzing, and $62.48 for shaft-sinking, the total expenditure on this account being $46,782. The Weber shaft is down 935 ft., and the 900-ft. level opened. West of the 'Big' fault the Nevada Hills vein system between the surface and 200 ft. yielded a fair tonnage; and the east side, at 500 ft., produced a considerable amount of low-grade ore. Nothing of value was found at 800 ft. Regarding the Wingfield vein, it seems that it has 'bottomed' on the hanging wall of the 'blout' vein at 770 ft. Little hope is held that it will be found at depth. No commercial ore occurs in the Eagle vein below 50 ft. The 503 vein is erratic in width and value, in places being low grade, and others 12 in. wide worth $100 per ton, at 900 ft., which is encouraging. Ore reserves are about 40,000 tons, equal to a mill supply for seven months. The cost of mining was $2.69 per ton of ore produced, or $1.94 per ton of ore and waste.

The mill worked 97% of the possible time, and treated 64,348 tons, equal to 176 tons per day, with 88.8% recovery. This ore was worth $505,799, or $7.86 per ton. Silver extracted was approximately 600,000 oz. Treatment cost $2.242, marketing concentrate and bullion 43.6c., and general charges 47c. per ton. Operating costs totaled $2.18 per ton below those of 1913. Quick assets are valued at $256,546, with no liabilities.

THE EXPLORATION COMPANY, LTD.

The directors of this holding Company state that for the year ended December 31, 1914, there was a net realized profit of £28,586, to which must be added £27,826, being the credit balance brought forward from the preceding year, making a total of £56,412 to the credit of profit and loss account. Sundry investments stand in the balance sheet at book cost. Owing to the restricted markets at the present time, and to the conditions existing in Mexico, the directors are unable to place, as usual, a reliable valuation on these investments; but recognizing that a serious depreciation exists, they cannot recommend the distribution of a dividend for the past year.

The Exploration Company of England and Mexico, Ltd., has not been able to resume business since January 1913. The El Oro Mining and Railway Co., Ltd., was compelled to suspend operations on April 26, owing to the disorganization of railway transportation which followed the occupation of Vera Cruz by the military and naval forces of the United States. On October 1, the El Oro company, under pressure from the then government of Mexico, was compelled to resume operations, and since that date has been operating to the best advantage that the disturbed conditions of the country permit. The Suchi Timber Co., Ltd., was compelled to cease production in August last, but resumed work on a modified scale in November. The Buena Tierra Mining Co., Ltd., was obliged to cease operations on April 23, but resumed again in July, and has since been working intermittently. The Santa Rosa Mining Co., Ltd., property has been shut down since April 1913, owing to the unsettled condition of the surrounding country. Two dividends of $1 each were paid by the Greene-Cananea Copper Co. in March and June last, but it was forced to suspend operations in August. Conditions in Mexico during the year 1914 did not improve. The operations of the above-mentioned Companies in that republic during the past year have in consequence been hindered and disturbed. The economic as well as the political outlook is still troubled and obscure. The Tomboy Gold Mines Co.'s Colorado property has been continuously and successfully operated throughout the year. A cyanide plant for the treatment of the residue from the gold mill has recently been installed, and the profits expected from this source should add considerably to the revenue of the Company. A plan for the reorganization of the Natomas Consolidated of California has been carried through during the past year. The new capital secured under this scheme will materially assist in the completion of the works which are necessary for the ultimate prosperity of the undertaking. The latest reports from the Chile Copper Co. are satisfactory.

New Machines and Devices

Miners' Electric Lamp

A new miners' electric lamp that is entirely safe to use, of strong construction yet light in weight, simple in design, fool-proof, efficient in operation and of ample guaranteed capacity, is being offered by the General Electric Co. The outfit consists essentially of a lead plate battery, carried on the belt; a ¾-cp. Mazda lamp with a suitable reflector held in a steel shell, carried on the cap; and a strong, serviceable cable connecting the battery and the lamp.

Owing to the hazardous nature of work in gaseous mines, a demand has been growing for some time for a practical, portable electric lamp. That an electric lamp would be safe to use has been well recognized, because it could be made so that it would not ignite inflammable gases, and would produce a uniform light regardless of atmospheric conditions. While the carbon filament lamp represented the best available electric illuminant, such a miners' lamp was not possible, because of its relative inefficiency; as storage batteries of the required capacity could not be designed within permissible weight and dimension limits. The perfection of the efficient Mazda lamp in miniature sizes by this Company, and the development of small, efficient, light-weight storage batteries has resulted in the design of the long-desired type BL form B miners' electric lamp.

GENERAL ELECTRIC CO.'S NEW MINERS' ELECTRIC LAMP.

The prime feature of this lamp is that it has been made thoroughly safe to use, by adequate insulation of the entire circuit. The outfit complete weighs only 3¾ lb., of which 3½ lb. is carried on the belt and 4 oz. on the cap. The battery is rated at 7.2 amp-hr. Normally it will light the lamp 12 hr. per charge, and can be relied on to furnish light at least 10¾ hr. per charge at the end of one year's service. The ¾-cp. Mazda lamp operates at 1.9 volts, and the reflector distributes the light evenly through a solid angle of about 130 degrees.

The battery is non-spilling, and the terminals are not subject to acid corrosion. Direct current only should be used for charging. In some instances mercury arc rectifier or motor-generator sets may be required to change alternating current into suitable direct current. Small sets adapted for this purpose can be supplied readily. Charging racks arranged for charging batteries conveniently in quantities are also offered. The battery case is of medium hard rubber. The battery box is of drawn sheet steel, electrically welded.

A Compact First-Aid Kit

In all first-aid work it is necessary to have materials handy for effective treatment of patients and in a compact container. Many of such outfits are in general use in individual establishments, mines, mills, and other places. Wood and tin boxes have been provided, but have several disadvantages. Glass jars are now being used for this purpose, and that sold by the National Affiliated Safety Organizations, of West Lynn, Massachusetts, was developed to meet all requirements of a compact, convenient, sanitary first-aid outfit. The jar itself is structurally strong, and is made yet stronger by a special annealing treatment. It was designed with smooth surfaces and particularly with straight walls on the inside to promote cleanliness and facilitate the removal of first-aid materials. In the glass cover of the jar is molded a convenient carrying handle and the cover is securely held on the jar by suitable spring clips which are a part of a metal cage in which the whole jar sets; this metal cage affords added protection against breakage of the jar. A rubber gasket between the jar and the cover makes the outfit dustproof and equalizes strains in the cover. The jar is made only high enough to accommodate the bottles of medicaments stored in it so that the stoppers cannot come out of the bottles when the cover rests on the jar. Medicine bottles, bandages, absorbent cotton, burn ointment in collapsible tubes, and a wire gauze splint are set along the wall of the jar so that they are plainly visible from the outside and can be quickly found. A metal dish of special construction placed in the inside of the jar keeps the materials just mentioned in their proper place. The metal dish itself is used as a receptacle for other parts of the contents, such as tourniquet, medicine glass, gauze bandages, medicine droppers, spoon, scissors, and other necessaries. Complete with contents it weighs about 12 lb., yet it includes all that is required for first aid. The jars are put up at West Lynn, under the supervision of the secretary of the associations, Magnus W. Alexander.

THE N. A. S. O. STANDARD FIRST-AID JAR.

Use of Electric Furnaces

The fact that the electric furnace offers a compact, reliable, and economical method of manufacturing crucible quality steel has now become more generally recognized among iron and steel founders, and, in consequence, there has been an appreciable increase in the number and size of the equipment recently installed or in process of construction, and a concomitant improvement in details tending toward improved efficiency, according to the General Electric Co. Perhaps the most striking advance has been in the induction type of furnace; for, prior to 1914, the largest unit of this type in the

RESISTANCE TYPE ANNEALING FURNACE WITH CONTROL PANEL. LATER FORMS OF THIS FURNACE ARE SHEATHED WITH CAST IRON PLATES.

United States had a capacity of only 2 tons, whereas during 1914 this was carried to 20 tons, two units of this rating having been completed. This is the largest of any type in the United States used for refining steel, the core and coils of each furnace weighing approximately 60 tons. The resistance type of furnace, which utilizes heat generated by passing the electric current through a resistor composed of foundry coke, with auxiliary heating from a carborundum arch radiating heat downward on the charge, has also been provided with a simple current relay control that insures the maintenance of a constant temperature over a range of approximately 600 to 1300° C. For the arc type of electric furnace, special forms of transformers and auxiliary equipment have been designed, together with a reliable system of automatic control, which is particularly interesting to the practical operator in that, except for a short period after starting the furnace, a constant power input is maintained at such a value as may be predetermined by the operator.

Commercial Paragraphs

The CHALMERS & WILLIAMS company, of Chicago Heights, Illinois, announce that the El Arco Mines of Mexico has purchased one of its adjustable quick-discharge tube-mills, also Nissen stamps and other mill equipment.

The TROPENAS CONVERTER CO., of New York, *Steel Castings* for February contains a discussion by G. Muntz and E. Roubieu on 'The Greatest Asset of the Steel Foundryman—Common Sense.' This deals with liquid steel, solidifying steel, semi-finished steel, and other points in the foundry.

The YUBA CONSTRUCTION CO. of Marysville, California, has installed a model dredge in the Yuba County exhibit at the Panama-Pacific Exposition. The boat is one-twentieth of the size of No. 14, now working on the Yuba river, and is complete in every respect. P. R. Parker, superintendent of the shops, was in charge of the installation.

The AMERICAN VANADIUM CO., of Pittsburgh, monthly *American Vanadium Facts*, contains notes on the use of vanadium steel in passenger and freight automobiles, couplers, and frames for the 'Mikado' class of locomotives for the Southern Pacific System. The tensile strength of the latter's cast steel frames is 83,570 lb. per square inch.

The JUSTRITE MANUFACTURING CO., of Chicago, manufacturer of acetylene lamps, lanterns, and fire-prevention appliances, has issued a complete catalogue of its specialties and the latest jobbers' and wholesale price-lists. The Company states that it had a substantial increase in business in 1914. It also calls attention to the necessity of carrying a stock of Justrite repair parts.

In the February issue of *Mine and Quarry* are the following articles: 'Rescuing an Iowa mine,' 'Low Drill Repair Cost on the Gogebic Range,' 'Air-Lift Pumping with Elevated Discharge,' 'A New Connecticut River Hydro-Electric Station,' 'Top Cutting in Coal Mines,' 'Two New Sullivan Drills,' 'A Utah Granite Enterprise,' 'Road Building in the Rockies,' and other interesting data for the miner.

The BLAISDELL MACHINERY CO., of Bradford, Pennsylvania, has issued an illustrated general catalogue of 120 pages, covering the smaller machines made. These include air-compressors of all types for use in sand-blasting, use in textile manufacturing, air-lift pumping, steam hammers, extraction of gasoline from natural gas, and other purposes. Vacuum pumps for many uses are described. A great deal of useful data are given on compressors and compressed air.

The W. S. ROCKWELL CO., furnace engineers, of 50 Church street, New York, has published on cardboard, ready to be hung on a wall of a melting room, a comparative scale of Fahrenheit and centigrade temperatures. Around a 4¼-in. circle are given the corresponding degrees of each scale; below it are the temperature conversion factors, and below these are details of hardening and tempering heats. A useful chart for assayers, smelters, and steel workers.

The BUSCH-SULZER BROS.-DIESEL ENGINE CO., of St. Louis, has issued a bulletin describing the type B, vertical, 4-cylinder, single-acting, 4-stroke cycle, enclosed crank-case, medium speed Diesel engine, with 3-stage air-compressor integral, manufactured by that firm. The publication covers in a few words the efficiency and economy of the engine, materials, workmanship, interchangeability, details of construction, fuel control, principal dimensions, life, and guarantees against defects. A number of illustrations serve to show the general characteristics of this excellent means of generating power.

In *Bulletin W*, 1915, the GENERAL FILTRATION CO., of Rochester, New York, describes the Robacher Filtros Wheel, a continuous rotary vacuum-filter. This filter is virtually a wheel, made of cast iron, with an over-all diameter of 10 ft. 6 in. Wood or other material may be used in construction. The wheel is divided into 16 separate compartments, with two compartments to a segment, each compartment being isolated from the others. Built up on this frame is the filtering medium 'Filtros,' which has been previously described in the *Press*. The plates of this material are two inches thick, and 160 are required for a 10-ft. wheel, the complete wheel weighing 9027 lb. 'Filtros' of several grades of porosity is supplied when ordered, to suit the finer or coarser pulps. Full directions are given in the bulletin for construction and operation of the wheel. The apparatus is less than half submerged in a tank containing pulp or wash water, and is connected with a vacuum-pump. With one revolution in four minutes a one-inch cake is formed, and the capacity is 3.84 tons of dry ore per hour; with one revolution in a half minute with a ⅛-in. cake, the capacity is 6.30 tons per hour. The treated cake is scraped off. The wheel consumes about one horse-power, excluding pumps and other plant. This machine may be used in filtering any material.

MINING PRESS

Volume 110 SAN FRANCISCO, MARCH 20, 1915 Number 12

LEADVILLE first attracted the attention of the miner by its gold placers. Later its silver-lead ores made it one of the best known districts of the world. Now its zinc and manganese ores have become of importance and new industries have sprung up in the mining town which spreads over the slopes of Carbonate and Fryer hills. In this issue is printed the first description of one of the most important—the making of zinc oxide pigments direct from the ore. The illustration in the upper corner is the Wetherill furnace in course of construction, and the illustration below shows the completed plant.

Zinc Pigments and the Leadville Works—page 443

MINING PRESS

Established May 24, 1860, as **The Scientific Press**; name changed October 20 of the same year to **Mining and Scientific Press**; shortened January 2, 1915, to **Mining Press.** Controlled by T. A. Rickard.

Published weekly at 420 Market street, San Francisco, by the Dewey Publishing Co., H. Foster Bain, manager. Entered at the San Francisco post-office as second-class matter. Cable address, Pertusola.

Branch Offices—Chicago, 300 Fisher Bdg.; New York, 1308-10 Woolworth Bdg.; London, The Mining Magazine, Salisbury House, E. C., London. Cable address, Oligoclase.

Price, 10 cents the copy. Annual subscription: United States and Mexico, $3; Canada, $4; other countries in postal union, 21s. or $5.

Issued Every Saturday

ARTICLES

LOOKING FORWARD 432

Unrest in industry has come to occupy a large place in the thought of those who realize that their duty as citizens is to bear their part in adjusting circumstances to environment in the life of society. The first prerequisite to relieving unrest is to find the causes of it, and the Federal Commission on Industrial Relations has summarized all the causes which have been brought to its attention by employees and employers.

ZINC PIGMENTS AND THE LEADVILLE WORKS.

By E. H. Leslie 433

Zinc forms the basis of four white pigments, and these are produced in amounts valued at several million dollars yearly. Some zinc ores are suited to the direct production of pigment from ore. The Western Zinc Mining & Reducing Co. has recently built a 50-ton plant at Leadville to produce zinc pigment, and the first detailed description of the plant is given here.

A SIMPLE SIEVE SHAKER.

By W. S. Black 439

Much labor can often be saved by taking advantage of appliances which are conveniently at hand. How labor can be saved in screening and better results obtained is described by an engineer.

COSTS AT THE HOLLINGER MINE AND MILL 439

Mining costs at the Hollinger have been reduced to less than $2 per ton and milling costs to less than $1.25. The items which go to make up the totals are here analyzed.

VISUALIZING WORKING CONDITIONS IN A MINE.

By H. N. Stronck and J. R. Billyard 440

Systematic control of mining operations is as feasible as similar organization in a workshop. Two young engineers have devised a method by which officers can see at a glance in what part of a mine work is being performed, the scope of the work, the number of men and machines engaged, and the extent of the work planned ahead for them.

THE OMINECA MINING DIVISION, BRITISH COLUMBIA.

By Wm. M. Brewer 443

Copper ores and placer gold are important in this district, which is tributary to Prince Rupert. The vein mines are rather difficult of access, and the deposits, though large, are many of them low grade.

MINING METHODS AT PARK CITY, UTAH.

By James Humes 444

Irregularity of the deposits in the Park City mines makes it difficult to determine beforehand the best method of removing the ore when found. By the use of small hoists, development work is reduced to a minimum, and as much ore is removed by overhand as by underhand stoping.

COSTS AT THE SONS OF GWALIA MINE 445

Details of the costs of the various operations in mining in a Western Australia mine are given, as well as the cost of milling by stamping, grinding, leaching, and filtering.

ECONOMICAL USE OF EXPLOSIVES.

By R. Noblett 446

Much of the dynamite used in charging holes is wasted, and by careful thought a smaller amount can often be made to do as much work. A working miner here tells how he found this out for himself, and offers useful suggestions to his fellows.

MINERAL PRODUCTION OF CANADA, 1914 447

Mineral products of Canada show a decrease of nearly 12% in 1914, according to preliminary estimates. Details as to products and provinces are given.

COSTS AT THE LAKE VIEW & STAR MINES 447

Mining costs at this Australian mine are $1.64 per ton; milling costs are $2.23. These are analyzed in detail.

THE HOLLINGER MILL'S RECORD IN 1914 447

The Hollinger mill recovered $2,719,354 from ore containing $13.67 per ton, making a tailing containing 56c. per ton, with a stamp-duty of 13.3 tons per day.

GOLD PRODUCTION OF THE PHILIPPINES 451

During 1914 an increase in gold production of nearly 40% was made, about equal amounts having been produced by dredging and lode mining.

PIG IRON production during 1914 decreased 7,633,908 tons, or 24.65 per cent, being the smallest output since 1908, according to the figures given out by the Iron and Steel Institute.

SMOKE investigation at Salt Lake City is to be directed at the coal-burning industries, according to advice from Mr. D. A. Lyon, instead of the smelters, as indicated in our editorial columns last week. It is pleasant to record that it is being recognized that smelters are not the only plants that make smoke.

RECORDS in converter practice have lately been made at the Hayden smelter, of which Mr. J. J. Ormsbee is manager. With a standard size Pierce-Smith converter an average of over 81 tons of copper per day was produced from a 42 per cent matte throughout the month of November. During the first half of February a daily average of 85 tons was maintained, and when the figures for the whole month are available it is probable that a new record will have been set.

ACCIDENTS cannot be altogether prevented by even the best of care, as the cave-in at the Gagnon shaft at Butte last month goes to show. The crew which was caught was made up of experienced men who had already repaired the timbering for 600 feet of the same shaft and were working in a part which did not appear to be in a dangerous condition when it suddenly caved for a distance of fifty feet. Four men died before they could be removed. The safety department of the Anaconda has done notable work, the fatal accidents in 1914 showing a decrease of 35.3 per cent as compared with 1913, and total a decrease of 7.8 per cent.

PRESENTATION of the annual gold medal of the Mining and Metallurgical Society of America to Mr. Robert H. Richards on March 18 was a happy recognition of the services to the mining profession of one who is not only a distinguished teacher but also an investigator of problems in ore dressing who has done more than any other American for the advancement of the art. His inventions are everywhere known, and in mining schools especially it is so rare that the college laboratory is able to contribute much toward the solution of problems in the mine and mill that his achievements are all the more notable. The Society does honor to itself in thus recognizing Mr. Richards' achievements.

FINAL figures for copper exports during the six months ended December 31 last are now available. Exports for the half year totaled 313,336,364 pounds, valued at $39,765,111, as compared with 469,492,649 pounds, valued at $71,964,054 in the same period of 1913; all of which scarcely supports the contention of the Foreign Office of Great Britain that our copper trade is in a prosperous state and that exports to European countries have shown a suspicious increase.

ACTION on copper shipments has at last been begun by the prize courts, and the first decision holds that no belligerent has a right to requisition a cargo belonging to a neutral government. The case at issue was a consignment of 1000 tons of copper to Götenborg for the use of contractors to the Swedish government. This was seized by a British warship. The registrar of the prize court proposed to turn the copper over to the British government for use at the Woolwich arsenal, but the Swedish owners successfully opposed such a high-handed course of action. The final disposition of the shipment is still to be passed on by the prize court. Now that action has finally been initiated, it is to be hoped that the many shipments still detained will be passed upon.

LEADVILLE, the site of the zinc oxide plant described in this issue by Mr. E. H. Leslie, is the long lived district of Colorado which always manages to bring out a new ore or industry at that time when needed most. The oxide plant, which was completed last year by the Western Zinc Mining & Reducing Company, is about to begin operations under the auspices of a new company which was organized by James B. McDonald, Howard E. Burton, and A. B. Augustine, all well known mining men of the district. In that the oxide works will make possible the treatment of the low-grade carbonate ores of the district, it is believed that the new industry will give a decided impetus to carbonate mining which has long been a problem with the Leadville miners. The zinc carbonate deposits of the district are quite extensive and capable of supplying ore to the new plant for many years to come. It would seem that the story of Leadville will never be complete. At the 'Pick and Hammer' dinners at Washington the young men of the Geological Survey sing:

"I is for Irving, who's wrestling still
With the endless report on the ores of Leadville."

BARITE

One of our subscribers has written to ask us whether it would be profitable to develop a barite deposit, the situation of which he does not state. As others may be interested in barite and equally unaware of the conditions governing it, a brief summary of them will be of interest. Barite is used for a great variety of purposes, such as the making of lithopone (a mixture of barite and zinc oxide) and other white pigments, in the paper industry to give weight and quality to the product, the manufacture of barium peroxide and of white rubber goods, glazing of pottery and the enameling of ironware, in the beet sugar industry, the manufacture of oilcloth and linoleum, filling the cloth of sacks, the making of certain cements, and of a long list of other articles, such as the artificial ivory from which poker chips are made. For most of these purposes the carbonate of barium, witherite, would be more satisfactory, but barite is so much more common that the desired salts are made from it by chemical processes. Even where it is used as sulphate it must undergo fine grinding and other preparatory processes which greatly increase its cost. Thus prepared, it ordinarily commands $15 to $25 per ton in the large city, while the average price realized at the mine by the domestic producers during 1913 was $3.45, according to the United States Geological Survey. New York and St. Louis are the markets in which the price of crude is fixed, and the usual sale basis there is $4 to $6 per ton for material containing 96 per cent $BaSO_4$, with a penalty of 20 cents per ton for each per cent less; material containing less than 92 per cent $BaSO_4$, or more than $1\frac{1}{2}$ per cent SiO_2, is ordinarily not salable. To the average millman the difference in price between the crude and prepared material seems a disproportionate one, and a company has recently been formed in New York that expects to be able to cheapen and improve the work of preparation.

Under these conditions it is obvious that freight rates will generally be the deciding factor as to whether any otherwise suitable barite deposit can be worked. As ocean freights are generally cheaper than railroad transportation, and as the largest consumption is along the Atlantic seaboard, a good deal is imported. Domestic production in 1913 was valued at $156,000, more than two-thirds of this being from Missouri, where large deposits of good quality exist and where freight rates to consumers in the Middle states are favorable to the domestic producer. Imports of crude barite in 1913 were valued at $61,500 and prepared products at about $430,000; of this, more than half was barium peroxide, which has come into general use for the making of hydrogen peroxide. The increase in trans-Atlantic freight rates because of the war and the interference with German production has given some advantage to the domestic producers, but the same general conditions still hold, and a large increase in domestic production can hardly be expected. Speaking generally, barite deposits in the Rocky Mountain region are beyond the possibility of being worked at a profit, as practically all the consumers in the West require prepared products and a market for crude barite is practically non-existent.

ECONOMIC GEOLOGY AND ITS NEEDS

Ten years ago a group of the younger men interested in applied geology undertook the publication of a journal devoted to that branch of science. The majority of them were workers upon the United States Geological Survey or some one of the various state organizations. By the same token they were men who had but moderate salaries, and few of the original group had any considerable other income. To found and undertake to maintain a scientific journal was, under the circumstances, a bold project. The support, to a modest degree, of a few of the men whose service outside official life had permitted accumulation of more capital was enlisted, and the sum of $2000 was subscribed. The shares were placed at $25. As we remember, the largest individual subscription was for four shares, except that the present director of the Geological Survey, then one of the younger assistants, subscribed for those remaining unsold so as to comply with the laws of the District of Columbia under which the publishing company was organized. These 'remaining' shares were subsequently distributed in small lots, and the total sum of $2000 has now gone into the enterprise. Into it also has gone an amount of hard work not altogether appreciated, we believe, by those who use and enjoy the ably conducted periodical that has resulted.

Economic Geology is just beginning its tenth year. From the first it enlisted the interest and support of an able corps of contributors, and in its pages have been printed many of the significant contributions to economic geology of the last decade. It has stuck close to its original plan and has trespassed neither on the field of pure geology or of that of the technology of mining. As a result its subscription list has been small though select. As a business venture, such a journal could not be hoped to be a success: that is, no revenues could be anticipated that would more than pay manufacturing cost, since as an advertising medium its field is limited. This was realized at the first, and the projectors and supporters of the journal have given their time, money, and energy purely for the good of the profession at large. From the first the managing editor has been Mr. John D. Irving, and with him have been associated such men as Messrs. Waldemar Lindgren, F. L. Ransome, J. F. Kemp, H. V. Winchell, M. R. Campbell, C. K. Leith, W. G. Miller, W. H. Emmons, and others who for longer or shorter periods have assumed responsibility for some part of the work. For several years Mr. W. S. Bayley has handled the business of the venture despite many demands on his time. Gradually the sum originally subscribed has been absorbed in the enterprise, though all have served without pay. The balance-sheet for 1914 showed expenses for the year amounting to $1200 in excess of receipts and only a

small amount in bank. Evidently more funds must be made available, publication stopped, or a considerable change made in the character of the publication. Under these conditions the board of directors has proposed to issue $20,000 worth of preferred non-voting stock, the proceeds to be invested in securities and only the income to be used to meet any deficit incurred by the journal. The amount asked for is small in proportion to the excellent work already done by *Economic Geology* and the good work of which it is capable. Part of the money has been subscribed, but more is necessary in order to complete the arrangement. We bespeak favorable consideration on the part of our many readers who, directly or indirectly, have received stimulus from the work already done. Mr. Lindgren, at the Massachusetts Institute of Technology, will gladly correspond with any who may be interested. It would certainly seem that the importance of the work and the spirit in which it has been conducted would insure a prompt and generous response from mining men.

PRECISION OF THOUGHT

Some time ago we printed an editorial on this subject explaining the reason why it is our practice to use the singular verb in such expressions as "626,000 tons was crushed." This statement of our position has attracted a gratifying amount of attention and a surprising intensity of opinion as to whether our views are or are not justified. Elsewhere in this issue we print a long letter from Mr. W. H. Shockley, discussing the matter. At the time of sending the letter, Mr. Shockley suggested that it was too long, and that most of it might profitably be excised, but at our solicitation he has consented to its publication in full. We are glad to accord it so much space, not only because, like all of Mr. Shockley's writings, it is interesting, but also because it represents the thoughtful effort of a studious and scholarly engineer to ascertain the truth, an attitude of mind which cannot be too highly commended. Above all, it serves excellently as a text upon which to elaborate our original thesis that a careful use of words is essential in the exact expression of precise thought, of which engineers should be the chief exemplars.

The point which we have made is, in the terminology of the chemist, a reversible reaction. Stating it in this way, the best use of words is contingent on precise thought, and this on a clear understanding of the subject under discussion. On this we base our premise that a studious and scholarly engineer is a better authority as to the best use of words in the literature of mining than a professor of the English of general literature. But before going further along this line of discussion it is necessary to settle a question of fact raised in Mr. Shockley's letter. Two of the professors of English to whom he submitted our editorial make the statement that, in the expression quoted above, 'tons' is not a collective noun and therefore the general rule does not apply. To show that the professors, and not ourselves, are in error here it will be sufficient to quote briefly from J. C. Fernald's recent 'A Working Grammar of the English Language,' page 294, where, following his discussion of collective nouns, he says: "Certain nouns plural in form are singular in construction, and take verbs in the singular number. See page 38." And on page 38: "A noun plural in form, when it denotes a collection, group, or amount, is treated as a singular taking a singular verb or being referred to by a singular pronoun; as, 'That hundred dollars is here.'" While it is possible to raise the point that a collective noun is ordinarily singular in form and that some other name should be applied to a noun plural in form which is treated as a singular, no grammarian seems to have devised such a term, and in referring to 'tons' as a collective noun we were in agreement with so good an authority as Fernald.

The really vital question is that raised in the concluding paragraphs of Mr. Shockley's letter: the mental concept which the writer was endeavoring to evoke in his readers. We submit that this concept is one of unity rather than multiplicity. What the writer had in mind was that an amount of ore, which he specified as 626,000 tons, was crushed. We have already made the point, which a physicist would be quick to grasp, that a ton cannot be crushed; it would be as difficult as to black the eye of a kilowatt. There is more unity here than in the expression 'football team,' because the individual members of the football team could easily be distinguished, but no one could possibly distinguish one ton from another of the quantity of ore crushed. Mr. Shockley gets an idea of multiplicity by thinking of cages rising and falling, and this is quite correct if he wishes to say that 626,000 skip-loads were hoisted. If, however, he is referring to the total quantity hoisted, a transfer of ideas is involved that serves to befog the concept. A mathematical relation can doubtless be deduced between the number of skip-loads hoisted and the total quantity in tons, but we find ourselves unable to perceive in what subtle way the multiplicity of the former injects itself into the unity of the latter.

With the *laissez faire* philosophy of style enunciated by Herbert Spencer and quoted with approval by Mr. T. R. Lounsbury, it is almost needless to say, we are not in accord. If a mechanical engineer designed his machinery with an eye single to avoiding friction, or if a business man organized his office force with the same object, without regard to the net total of results desired, it is evident that the outcome would be unsatisfactory. Skillful writers often insert in their paragraphs words or phrases which catch and detain the reader's attention, just as an architect relieves the monotony of a smooth surface by projections or decorations. Mush is an unsatisfactory diet; the average man likes something he can get his teeth upon. The average reader is none the worse for meeting a word or phrase which focuses his attention, and if it causes him to think carefully, as our use of the singular verb seems to have done, the result is a useful one.

LOOKING FORWARD

The primary duty imposed upon the Commission on Industrial Relations by Congress is to ascertain "the underlying causes of dissatisfaction in the industrial situation." While it is recognized that this subject is practically inexhaustible, it is believed nevertheless that the testimony furnishes an outline of the fundamental causes. Analysis of this testimony shows that the following causes have been most frequently advanced by the witnesses who have been questioned on this subject:

1. Largely a world-wide movement arising from a laudable desire for better living conditions. Advanced by representatives of labor, sociologists, and employers, and generally endorsed.

2. A protest against low wages, long hours, and improper working conditions in many industries. Advanced by practically all labor representatives and assented to by many employers.

3. A desire on the part of the workers for a voice in the determination of the conditions under which they labor, and a revolt against arbitrary treatment of individual workers and against the suppression of organization. Almost uniformly approved by labor witnesses.

4. Unemployment and the insecurity of employment. Generally advanced by witnesses from every standpoint.

5. Unjust distribution of the product of industry. Advanced by most labor representatives and agreed to by some employers.

6. Misunderstanding and prejudice. Agreed to by employers and employees.

7. Agitation and agitators. Generally advanced by employers, but defended by labor representatives and others as a necessary means of education.

8. The rapid rise of prices as compared with wages. This was given by a very large number of employers, labor witnesses, and students of industrial conditions.

9. A rapidly growing feeling that redress for injustice and oppression cannot be secured through existing governmental institutions. The statement came from a large number of labor witnesses.

In addition, it has been stated by many witnesses that the tremendous immigration of the last quarter century, while not itself a direct cause of unrest, has served to accentuate the conditions arising from other causes by creating an oversupply of labor, unfamiliar with American customs, language, and conditions. A number of causes must be considered in relation to the partisan bias of the various witnesses who urged them.

Causes of Unrest Advanced by Employers

1. Normal desire for better living conditions.
2. Misunderstanding and prejudice. Lack of conception that interests of labor and capital are identical.
3. Agitation by politicians and agitators.
4. Unemployment.
5. Unreasonable demands arising from strength of organization.
6. Labor leaders who stir up trouble to keep themselves in office and to graft on employers.
7. Inefficiency of workers.
8. Rapidly increasing complexity of industry.
9. Sudden transition of large numbers of foreigners from repression to freedom, which makes them an easy prey to labor agitators.
10. Universal craze to get rich quick.
11. Decay of old ideas of honesty and thrift.
12. Misinformation in newspapers.
13. Too many organizations for combative purposes.
14. Violence in labor troubles.
15. Sympathetic strikes and jurisdictional disputes.
16. Boycotting and picketing.
17. Meddlesome and burdensome legislation.
18. The 'closed shop,' making for labor monopoly.
19. Financial irresponsibility of labor unions.

Causes of Unrest Advanced by Employees

1. Normal desire for better living conditions.
2. Protest against low wages, long hours, insanitary and dangerous conditions existing in many industries.
3. Demand for industrial democracy, and revolt against the suppression of organization.
4. Unemployment, and the insecurity which the wage-earner feels at all times.
5. Unjust distribution of the product of industry. "Demand for full share of production."
6. Unjust attitude of police and courts.
7. There is one law for the rich, another for the poor.
8. Immigration, causing oversupply of labor.
9. Existence of a 'double standard,' which sanctions only a poor living in return for the hardest manual labor, and luxury for persons who perform no useful service.
10. Disregard of grievances of individual employees and lack of machinery for redressing the same.
11. Control by 'Big Business' over industry and state.
12. Fear on the part of those in comfortable positions of being driven to poverty by sickness, accident, or involuntary loss of employment.
13. Inefficiency of workers through lack of training.
14. Unfair competition from prison labor.
15. The rapid pace of modern industry, which results in accidents and premature old age.
16. Lack of attention to sickness and accidents.
17. Arbitrary discharge of employees.
18. Blacklisting of individual employees.
19. Exploitation and cruel treatment of women and children in industry.
20. Promotion of violence by the use of gunmen, spies, and provokers hired by employers.
21. Attempt to destroy unionism by the pretense of the 'open shop.'
22. Ignorance of social economics on the part of employers and indifference to well-being of employees.
23. Monopolization of land and natural resources.
24. Suppression of free speech and right of assembly.

Zinc Pigments and the Leadville Works

By E. H. LESLIE

Mineral paints are usually divided into three groups natural mineral pigments, pigments made directly from ores, and chemically manufactured pigments. The first group includes ochre, umber, sienna, hematite, siderite, and limonite. The last three, which are ores of iron, are the principal basis of metallic paints and mortar colors. Many other minerals or mineral products are used in the paint trade, such as asbestos, aluminum, asphalt, barytes, clay, graphite, gypsum, magnesite, mica, pyrite, and tripoli. Zinc oxide, with which this article is concerned, belongs to that group of pigments which are made directly from ores, including zinc oxide, leaded zinc oxide, sublimed white lead, and sublimed blue lead; the last two are commercially known as the basic sulphates of lead. The third group, the chemically manufactured pigments, comprises the chemical products—basic carbonates, white lead, litharge, red lead, orange mineral, lithopone, and others. While the production of natural pigments has increased somewhat of recent years, there has been a decrease in the production of those made directly from ores and chemically manufactured. The total marketed production of the United States of the three groups, according to the United States Geological Survey figures, was as follows:

	1912.		1913.	
	Quantity.	Value.	Quantity.	Value.
Natural mineral pigments	74,657	$ 561,693	75,595	$ 522,410
Pigments made directly from ores	106,497	9,507,895	97,573	9,020,896
Chemically manufactured pigments	228,135	26,356,232	219,644	25,123,167
Total	409,289	$36,425,820	392,812	$34,666,473

There are four white pigments which have zinc for a base, either in whole or in part, namely, zinc oxide, leaded zinc oxide, zinc-lead oxide, and lithopone. All of these pigments may be made direct from ore, and in American practice the first three pigments mentioned usually are made in this manner. Zinc oxide is the most important of these pigments. In European practice the oxide is made from spelter, although in France zinc oxide is made from ore in an electrothermic furnace invented by Côte and Pierron. In the United States the oxide is largely made from ore, although spelter is accountable for a good percentage of the output.

Zinc oxide, which is the most important of the zinc pigments, is a white powder consisting, when chemically pure, of 80.34% zinc and 19.66% oxygen. On account of its stability, whiteness, opaque nature, and slight tendency to chalk, it is invaluable as a pigment. Its extreme hardness makes it less resistant to temperature changes, when used alone, than the more stable complex formulas. The two methods of manufacture are known as the American and French processes.

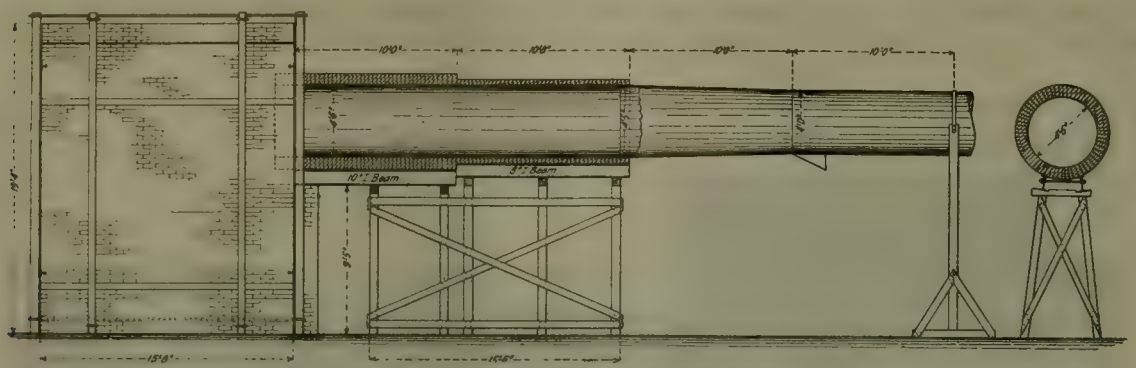
BAG-HOUSE AND ROASTER PLANT, LEADVILLE WORKS.

The ores from which zinc oxide is made are the franklinite ore of New Jersey, the sulphide ores of the Mississippi valley, and the sulphide, carbonate, and silicate ores of Colorado, New Mexico, and Nevada. The companies which produced zinc oxide in 1913 were the New Jersey Zinc Co. of Pennsylvania, with plants situated at Palmerton and Freemansburg, Pennsylvania, the Mineral Point Zinc Co., at Mineral Point, Wisconsin, and the Bertha Mineral Co., at Austinville, Virginia. The Western Zinc Mining & Reducing Co.'s Leadville plant is the latest of the American plants, and while its installation was fraught with difficulties, the practice is

most modern and the plant, while of only 50 tons capacity at present, gives promise, when the present difficulties have been eradicated, of becoming an important factor in the industry.

Zinc oxide manufacture on a commercial scale was commenced in the United States about the year 1855, the oxide being manufactured under patents issued to Samuel Wetherill and Samuel T. Jones. The Wetherill patents covered the furnace and the preparation of the material, while the Jones patent covered the manner of collecting the fume. The Wetherill furnace, a modification of which is used at the Leadville plant, consists of an arched chamber of rectangular horizontal section. The hearth is supplied with perforated cast iron grate through which air is admitted under pressure. The charge rests upon the grate. The forced draft oxidizes

The construction of a zinc oxide plant at Leadville, it would seem, was the logical move for the industry, as the district abounds in carbonate zinc ores which have been the source of no little trouble to market profitably. The new plant is in a position to handle 14% zinc carbonate ore, where the zinc smelters will not consider ore containing less than 20%. As the Leadville ore has not proved amenable to the established concentration methods, the new oxide plant offers a solution for the zinc carbonate problem of the Leadville district, and when fully established the new plant will undoubtedly make some of the old carbonate deposits profitable. The plant is situated about two miles west of the city of Leadville, Colorado, on a spur of the Denver & Rio Grande railway, and is, therefore, but a short distance from the mines of the district and the freight rates on the ore are very



FURNACE CONNECTION WITH THE FUME CONDUIT.

the lowest layer of coal forming carbonic acid (carbon dioxide), which passes through the bed of coal and is reduced to carbon monoxide. The monoxide reduces the zinc oxide of the ore to metallic zinc, which is reoxidized in the presence of carbonic acid. The zinc at the highest temperature of the furnace, volatilizes and its heated vapors, uniting with the oxygen of the carbonic acid, are again oxidized. Thus reduction and oxidation of the zinc takes place in the same furnace chamber. The oxidation must take place from the carbonic acid, as the nature of the process prohibits sufficient atmospheric oxygen. The residue or slag is removed from the furnace after the charge is treated, and consists of ash and the non-volatile contents of the ore. This is scoriaceous in character. If the ore contains gold, silver, or copper, these metals are retained in the residue and may be subsequently recovered by ordinary methods. The oxide formed is carried off by exhaust fans through the clarifying and cooling systems and is finally collected in large muslin bags. A great number of these bags are connected to the sheet iron hoppers, which in turn are connected to the conveying pipes, permitting the entry of gases in which is suspended the amorphous zinc oxide. The gases escape through the porous cloth and the zinc oxide is separated. The bags are shaken at intervals, the oxide falling from the bags in which it has been collected, and discharging into the hoppers from which it is drawn at stated intervals through openings in the bottom.

low. The plant is housed in frame buildings, an idea as to the size and construction of which may be obtained from the accompanying halftones. The total investment is exceedingly modest as compared with the cost of a modern 50-ton zinc smelter for spelter production. The plant was designed and erected under the direction of E. J. Jones, whose name has been prominently connected with the zinc smelting industry for a number of years.

The situation of the Leadville plant, due to its extreme altitude of over 10,000 ft. presented special problems in the smelter construction, which could only be solved by experience, and several improvements are still to be made before the plant will attain its greatest efficiency as an oxide producer. One of the principal difficulties with the present plant is the lack of bag capacity. At a lower altitude this difficulty would not have been experienced, but at an altitude of 10,000 ft. it is necessary to use so much greater volume of air in the furnace that the bag-house for such a plant must necessarily be greatly increased over a similar plant at sea-level. This shortage in bag-house capacity increased the ordinary losses and consequently decreased the extraction. The labor problem is also one of the difficulties to be contended with in the operation of an oxide plant in a new locality. Furnace work is very hard manual labor and requires experienced men for the best results. None of the obstacles encountered, however, are of a serious

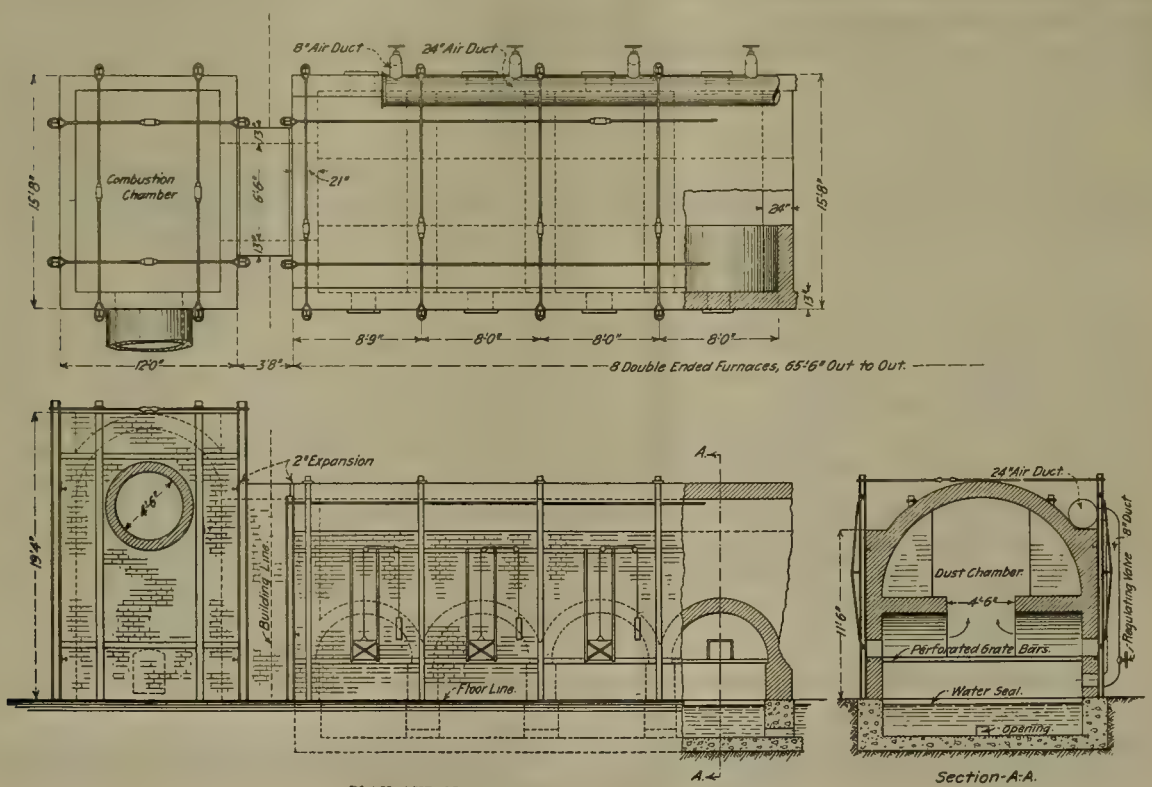
nature, and with a reorganization and rehabilitation, the plant will undoubtedly be an important factor in the activities of the district.

WETHERILL FURNACE, SHOWING METHOD OF REINFORCEMENT.

The carbonate ore, which is a smithsonite mined in the district, is delivered at the plant in standard freight cars and unloaded by hand into the storage bins or stored in piles for future use. The ore is fed through a hopper over a $^3/_8$-in. screen and the oversize from the screen is discharged into a 9 by 15-in. Blake crusher and is here reduced to about $^1/_4$-in. The discharge from the crusher, together with the undersize from the screen, is elevated by a bucket elevator to a $^1/_4$-in. revolving trommel screen. The undersize from the screen, which is through $^1/_4$-in., is then elevated to a wooden storage bin of 200 tons capacity. The oversize from the trommel is returned to a set of 12 by 20-in. Denver Engineering Works rigid rolls and is here given a regrind and returned by elevator to the trommel. The entire crushing plant is driven by one 50-hp. General Electric Co. motor operating on a 440-volt circuit. Power is supplied by the Colorado Power Co., being generated at Shoshone.

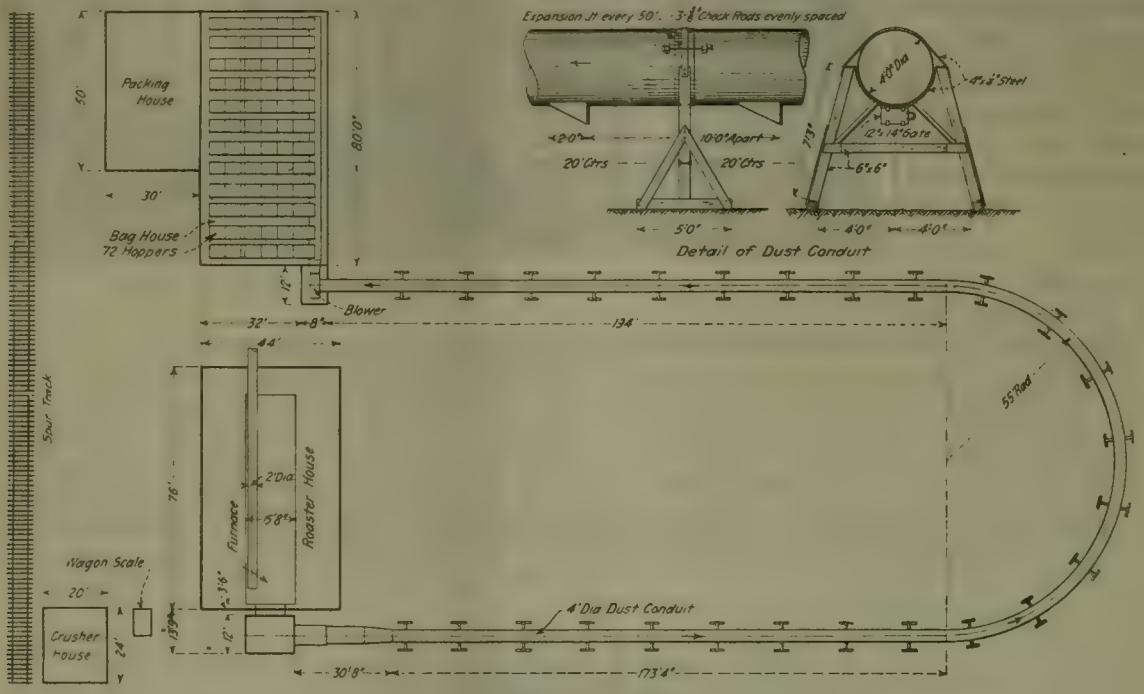
The coal used for mixing with the ore for the furnace charge is mined at the Floriston mine of the Colorado Fuel & Iron Co., and is an anthracite screening. This fuel as delivered at the property is through $^1/_4$-in., and as such requires no further crushing before being mixed in the furnace charge.

As the plant stands, no mechanical mixer has been



PLAN AND SIDE ELEVATION OF WETHERILL FURNACE.

provided and the ore and fuel as drawn from the bins are weighed and mixed by hand on the floor of the furnace room. This method of mixing is not as satisfactory as the mechanical method, and the concrete mixer which is generally employed for this purpose will eventually be substituted for the present hand method. The charge consists of two parts by weight of ore to one of coal; each single charge as mixed for one fire-box of the furnace consists of 1000 lb. ore, 500 lb. of soft coal, and 300 lb. hard coal which is first thrown on the grate and allowed to ignite from the heat from the arch before the charge is thrown in.



PLAN OF LEADVILLE WORKS.

Modified Wetherill Furnace

The Wetherill type of furnace is of special design, the construction of which is shown in the accompanying drawings and halftones. The over-all dimensions of the furnace are as follows: length, 65 ft. 6 in.; width, 15 ft. 8 in.; and height, 11 ft. 6 in. The foundation of the furnace is of concrete, as shown in the drawing and is so constructed as to be made up of eight water-tight compartments which are connected with one another by openings through the dividing walls. In the operation of the furnace these foundation compartments below the grates are kept partly filled with water, the small amount of steam thus formed and mixed with the air which is forced through the grates aids in the operation of the furnace by augmenting the oxidation process. When it becomes necessary to clean out the water-sealed compartments, in which material gradually accumulates by falling through the grate, workmen enter the compartments below the grates through an opening in front of the furnace below the fire doors. This opening is closed with brick when not in use.

The furnace proper is built of Cañon City fire brick and is of a double arch construction and made up of eight individual fire-boxes on each side of the furnace. These fire-boxes are 7 ft. 6 in. by 6 ft. 9 in. and are arranged on opposite sides of the furnace, as shown in the accompanying drawing. The fire-boxes have perforated grates made of cast iron in which are cast openings which are in the form of truncated cones with their base toward the foundation. These apertures are ⅛ in. diameter at the top and ¾ in. at the bottom. The plates used for the grates are made to extend completely across the furnace under the fire-boxes on opposite sides of the furnace. They are cast 11 in. wide, 6 ft. 9 in. long, 1¼ in. thick, and are laid adjacent to each other and supported by the walls of the furnace and rails crosswise of the furnace, their ends laid in the walls. The arches over the fire-boxes are semicircular in form springing from the grate level. The gases from the fire-boxes discharge into the centre of the furnace, where they ascend to the main arch of the combustion chamber. This arch is semicircular and at right angles to the arches of the fire-boxes, the construction of which is shown in the drawing. The furnace is reinforced with trussed railroad iron buck stays. The ends of the furnace are braced with 90-lb. buck stays, and the intermediate stays are of 52-lb. rail and reinforced by trusses. The buck stays are set in concrete foundations and tied at the top with ¾-in. tie rods.

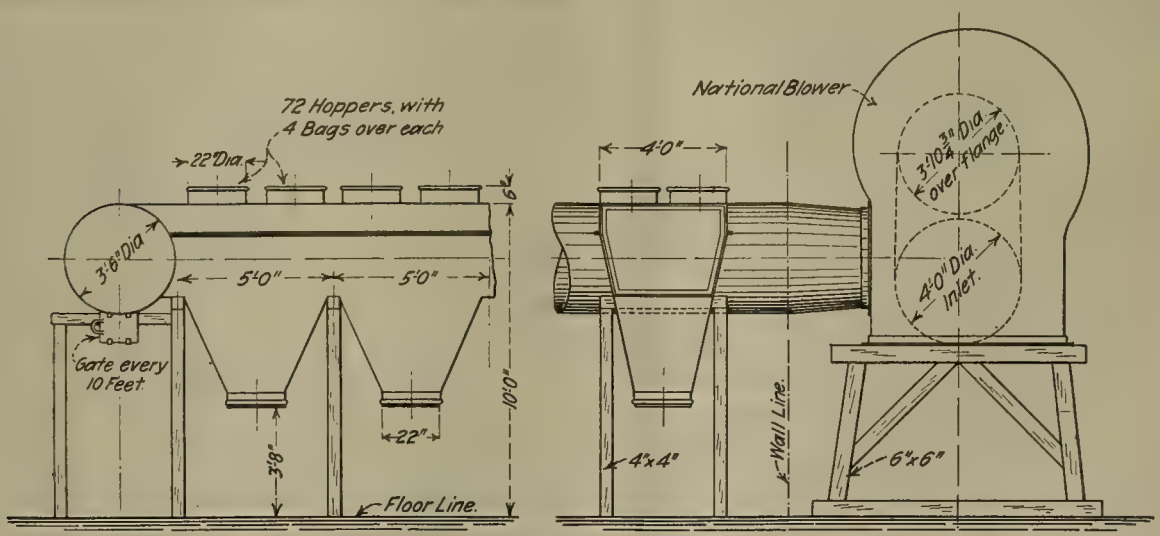
At the end and outside of the furnace building is a chamber built of fire brick which is 15 ft. 8 in. by 10 ft.

FOUNDATION FOR WETHERILL FURNACE, SHOWING WATER-SEALED COMPARTMENTS.

and 19 ft. high. A brick tower is commonly used, but at this plant the chamber causes the most of the ash to settle which is carried from the furnace by the blast. This is subsequently removed through a door in the bottom of the chamber. Upon the top of the furnace rests a 24-in. air main to which 8-in. pipes are connected that conduct the air to the pit under the grate, one of such blast pipes being supplied for each of the compartments of the furnace.

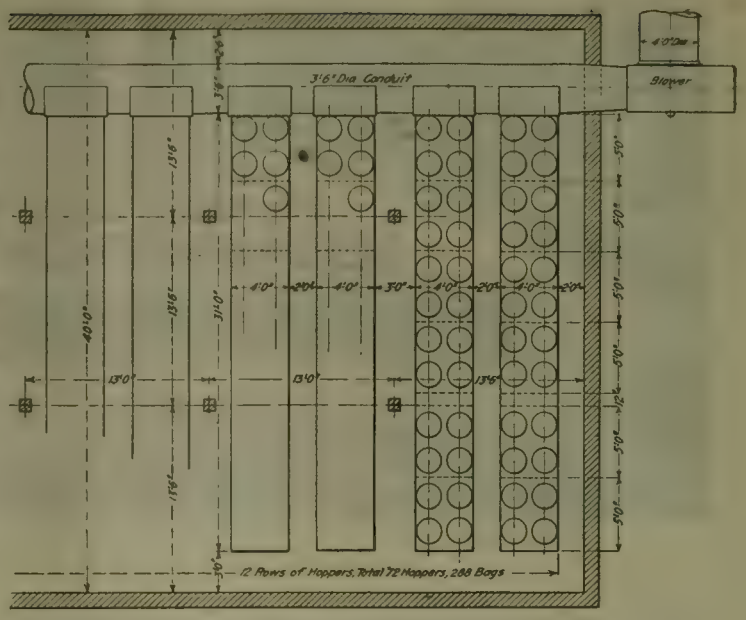
In the operation of the furnace after the grate has been cleaned a thin layer of anthracite screenings is thrown into the fire-boxes, which ignites almost immediately from the heat of the furnace, a low blast pressure being used at this stage of the operation. The charge, which is a mixture of 1000 lb. ore and 500 lb. anthracite screenings, is then shoveled in, it being evenly distributed over the thin bed of coal. The charge is slightly moistened before being charged, and after being shoveled into the furnace the blast pressure is gradually raised to about 5 oz. In operating the furnace, care must be exercised to keep the combustion uniform throughout the fire-box by avoiding blow holes in the charge which cause an uneven combustion. About four hours is required to exhaust a charge. In operating the furnace the fire-boxes are charged one after another, keeping the flue temperature as nearly uniform as possible. In this manner about 50 tons of ore is treated per day. When the charge is exhausted in one of the fire-boxes the ashes are drawn and the clinker or 'slag' is pried from the grate and removed. The clinker carries from 3.8 to 4.2% zinc.

The zinc oxide fumes as discharged from the furnace require purification and are conducted from the chamber at the ends of the furnace through a dust train 600 ft. long to the bag-house. The train is 'U' shape with a radius of 55 ft. and is supported on wooden trusses. The



DETAILS OF HOPPERS, FAN, AND BAG-HOUSE CONNECTION.

construction and plan of this train are as shown in the accompanying sketches. A No. 10 Sturtevant blower, operating at 1020 r.p.m., supplies the blast for the furnace, and a National exhaust fan, operating at 250 r.p.m., draws the fume and gases through the dust train and forces them through the bag-house. A 75-hp. General Electric motor supplies the power for both the blower and fan. The dust train is fitted with hoppers every 10 ft., and discharge gates as shown in the sketch, and here the impure oxide is collected as deposited from the fume and is periodically removed and shipped to the smelters for converting into spelter. The gates may also be opened to cool the train if it becomes over-heated.



PLAN OF BAG-HOUSE.

Bag-House

In the bag-house there are 12 lateral branches from the main train; the plan and construction of which are as shown in the accompanying drawings. It will be noted that the laterals are supplied with a hopper for every four bags. There are thus 6 hoppers or 24 bags on each lateral, giving the present bag-house a complement of 288 bags. The bags are of muslin, of 22 in. diameter, and about 24 ft. high, being suspended over the hoppers and laterals to which they are attached from supports at the top. The capacity of the plant is from 8 to 10 tons of zinc oxide per day. The oxide is of good quality, an analysis of which is as follows:

	Per cent.		Per cent.
ZnO	98.0	PbO	none
$ZnSO_4$	0.5	$PbSO_4$	1.5

The plant is operated in three 8-hour shifts. Two men are employed on each side of the furnace during each shift, making a total of 12 men for handling the furnace. A day foreman and a night foreman, together with a man in the bag-house, one in the packing house, and two men in the cooperage comprise the operating force, with four men for unloading and crushing.

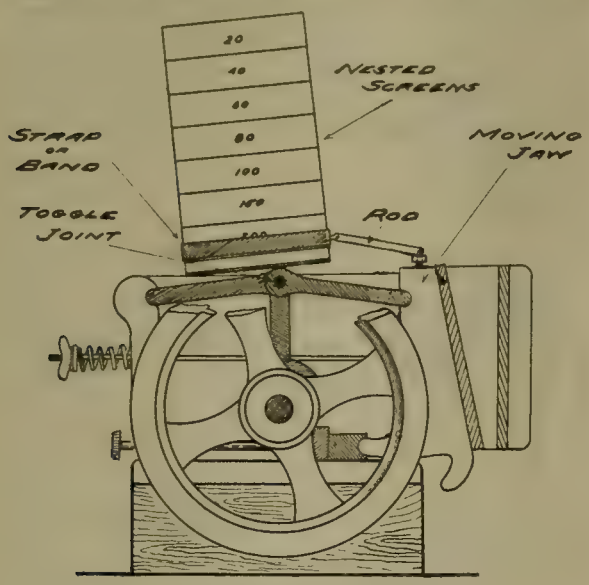
While at the present time the plant is not in operation for reasons not pertinent to this discussion, the ten days' trial run demonstrated that the plant is well adapted to the purpose of its designers. However, several minor changes must be made for its most efficient operation before it is put into commission permanently, as more or less trouble was experienced in the preliminary run. The principal difficulty is the lack of bag-house capacity. At a lower altitude the present equipment would undoubtedly be adequate, but at an altitude of 10,000 ft. it is necessary to use so much more air in the furnace that more bags are necessary. With the present equipment and great volume of air and reduced pressure on the outside of the bags, they are kept tight, resulting in a loss of oxide from the doors of the furnace. Unfortunately the greatest amount of air is used when the furnace is making the most and heaviest oxide, and it was at this time that the losses by blowing out of the furnace doors was greatest. It was estimated on assays of the clinker and oxide output that the loss due to this source was almost 30%. This difficulty could be overcome by either enlarging the bag-house, which would be much the cheaper and simpler way, or by enlarging the pipe-line. The latter would be more expensive, but much more efficient, as it would allow the fumes to stay longer in the pipe and give them a better opportunity to cool. By this means the suction fan could be slowed down, using less power and reducing the pressure on the bags. It was found in the operation of the plant that the bags became quite hot at times and it became necessary to admit large quantities of cold air into the line. This trouble would not be overcome by enlarging the bag-house. The lack of a mechanical device for mixing the charge also added difficulties, in that with imperfect mixing of the charge, the best extraction was not possible, as considerable of the ore was not burned, due to the hand mixing employed. Inexperienced labor was also a source of trouble. Furnace work is hard labor and it was difficult to keep men not accustomed to it at work. This necessitated the continual training of new men, which was not conducive to the best results. As a result of these difficulties, most of which can be corrected, the trial run showed a loss of about 40%. The zinc oxide produced in this run was not up to standard in color, due to the unskilled labor in not keeping the furnace in condition to make a pure white pigment. However, the oxide is but slightly deficient in this respect and can be brought up to standard by heating for five minutes in a stove or furnace. The cost of producing zinc oxide in Leadville should not exceed $40 per ton, although the trial run was hardly long enough to determine exact costs.

A Simple Sieve Shaker

By W. S. BLACK

The usual assay office is rarely equipped with a mechanical sieve shaker. In some plants such a piece of apparatus is by no means necessary, as very few screening tests have to be made, but in other plants screening tests must be made regularly; this is especially true of plants which are obliged to resort to fine grinding to obtain good extraction, and in such cases the hand screening of the different products becomes exceptionally tedious and trying. If a number of tests have to be made and a mechanical sieve shaker is not available, a simple and efficient substitute may be easily set up on a common laboratory sample crusher.

The general arrangement is shown in the accompanying cut. The nest of sieves is placed directly over the toggle mechanism of the crusher. A strap or a metal



A CONVENIENT SIEVE SHAKER.

band is fastened snugly about the bottom screen, and to this a short stiff rod is connected, which is in turn connected to the top of the moving crusher jaw. Now when the crusher is started the hinge of the toggle rises and strikes a sharp upward blow against the sieves and then drops them again on the frame of the crusher, which causes another sharp shock. At the same time that this is happening the crusher jaw is moving backward and then forward, which causes two sharp accelerated jerks to be imparted to the sieves through the connecting rod. The result of this series of oscillations is a good screening action. There are a few points, however, which must not be overlooked if good results are to be obtained. There must be no play or looseness in the connecting rod; for if equal thrusts in both directions are not given to the sieves the material will accumulate at one side of the screen, and the full screening area will not be utilized. For the same reason the position of the sieves with respect to the toggle joint must not be overlooked. The correct position can be best determined through actual trial, changing the length of the connecting rod until the best results are obtained. Another point is the protection of the bottom pan of the nested screens; for if it is not protected it will wear rapidly from its contact with the toggle. This may be accomplished by using a shallow pan made from sheet tin to fit over the sieve pan. While this method affords good protection, it has the objection of being rather noisy. A better method is to have a piece of stiff belting riveted to the sieve pan.

The use of this device not only has the advantage of being a labor saver, but it may also be used to secure accurate comparative results, such as are often desired on classifier and tube-mill products. By screening equal samples for equal lengths of time, the results will be found to be much more valuable for comparative work than any which can be obtained by hand screening.

Costs at the Hollinger Mine and Mill

In 1914 this property, at Porcupine, Ontario, produced 208,936 tons of ore averaging $13.676 per ton, with the following costs:

COST PER TON MATERIAL BROKEN

Mining:		Track laying	$0.023
General charges	$0.022	Tramming	0.300
Superintendence	0.050	Pipe-fitting below	0.025
Diamond-drilling	0.038	Mine drainage	0.024
Cross-cutting	0.074	Hoisting	0.141
Shafts	0.036	Landing	0.029
Driving	0.254	Drill repairs	0.049
Rising	0.019	Sharpening steel	0.071
Winzing	0.022	Collecting steel	0.028
Tramways	0.006	Mine sampling	0.019
Timbering shafts, winzes, and rises	0.032	Assaying	0.005
Stoping	0.534	Change-house	0.007
Scaling	0.011	Surveying	0.009
Timbering drifts and stopes	0.101	Mine lighting	0.017
		Total mining	$1.946

The mill treated 211,846 tons of ore, of which 2910 tons was from the Acme mine, controlled by the Hollinger company. The distribution of costs was as follows:

COST PER TON OF ORE MILLED

Milling:		Handling pulp	$0.040
General charges	$0.054	Thickening	0.014
Superintendence	0.047	Continuous decantat'n	0.031
Disposal of residue	0.018	Filtration	0.103
Lighting	0.011	Neutralizing	0.012
Heating	0.039	Clarifying and precipitation	0.063
Shoveling in bins	0.012	Refining	0.059
Crushing	0.079	Pumping solution	0.021
Conveying	0.034	Cyanide	0.083
Stamping	0.160	Cleaning mill	0.019
Classification and tube-mills	0.188	Alterations	0.034
Concentration	0.062	Assaying	0.015
Handling concentrate	0.007		
Treating concentrate	0.032	Total milling	$1.237

When alterations and additions to the mill are completed, the daily capacity will be 1600 tons.

Visualizing Working Conditions in a Mine

By H. N. STRONCK and J. R. BILLYARD

The bulletin-board method of visualizing and dispatching, as used in shop management, can be modified and made applicable to mines, and we will here endeavor to shew how this can be done. The method is flexible and can be changed for different conditions. As explained here, it is based on assumed conditions such as are found in general mining practice in a mine which employs about 200 men.

The general duties of a shift boss in a mine are very numerous, therefore he must be an all-around man to perform them capably. He must see that the men are supplied with work at all times, see that they are supplied with materials and tools, direct and show them where, when, and how work should be done. The method introduces a new functionary, a master shifter (who may be the foreman or superintendent), who answers the questions, *what* work should be done and *where, when* it should be done and by *whom*. This relieves the bosses of these functions and gives them more time to actually direct operations. By grouping these functions, better co-ordination of work is assured, which results in a saving of time.

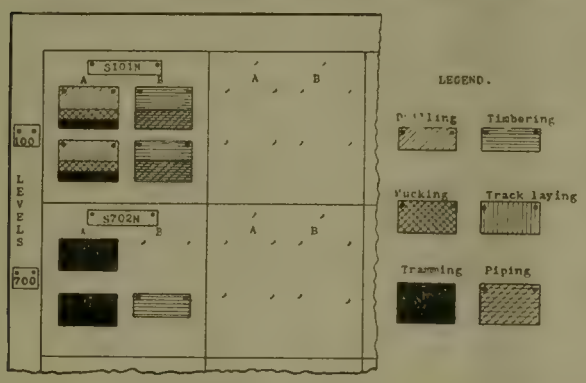


FIG. 1. STOPE BOARD.

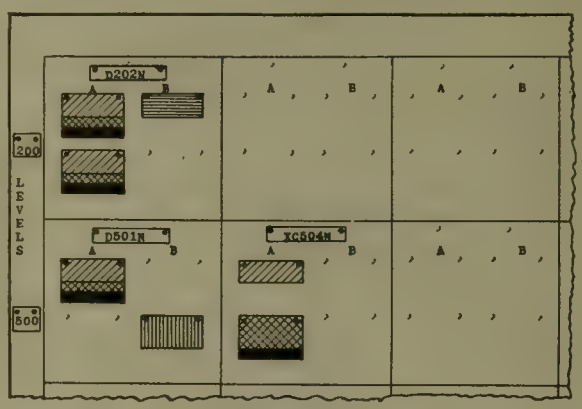

FIG. 2. DRIFT AND CROSS-CUT BOARD.

A brief description of the method successfully worked out and practised in connection with the Taylor system of scientific management in shops is given, to show our aim. Each machine and workplace is given a symbol or number, and is represented on the bulletin board by three sets of hooks. A card, or operation order, as it is called, on the first set of hooks, shows that work is being performed on that machine or at that workplace, at the present time. Cards on the second set of hooks show work ready at the machine or workplace and to be performed next in regular sequence. Cards on the third set of hooks show work which will be done in the future, but which is not yet ready. These boards show at a glance the exact conditions in the shop, and are of great aid in planning and co-ordinating work.

It will be noted that in a shop the machines and workplaces are fixed, which fixes the position of the men that do the work, and the work is routed and moved to these fixed places. In a mine the work is, to a certain extent, fixed, and the men and machines must be routed and moved to the work, so that almost reverse conditions prevail. In an ideal shop, work is always in progress at each machine and workplace, while in a mine, work may be temporarily or entirely abandoned in whole areas of the mine. This also calls for a change. In order to save space and to simplify the method, mine work is here classified under two headings, A and B. A represents the direct mining operations of drilling, shoveling, and tramming. B represents the necessary auxiliaries of timbering, track laying, piping, and others.

A complete survey, which shows the position of all workings of the mine, must be made. A glass model will be of aid. All drifts, stopes, cross-cuts, and other openings must be numbered or named in a manner which definitely indicates their position; these numbers are placed on the map and workings underground, so that the *where* can be designated and easily found. Also a record must be made of the different kinds of work that each man can do and that for which he is best qualified. This information must be indexed and filed so as to be quickly available.

Any number of bulletin boards may be made. In the present case, three are considered; one for stoping, one for drifts and cross-cuts, and one for rises, winzes, and shafts. These boards are made large enough to show present places where work is carried on, and anticipated future places as well. For example, the stoping board (Fig. 1) is laid out for four stopes. Each stope is indicated by a card above with a number in the corresponding level. All stopes on one level run in a horizontal line. Each stope has four sets of hooks from

FIG. 3. OPERATION CARDS.

which the operation cards are suspended. The two sets of hooks in the vertical column under A represent the operations of drilling, shoveling, and tramming; those under B of timbering, track laying, piping, and miscellaneous. Each operation under A is designated by a card of different color and length. Similarly for operations under B. Cards suspended from the first horizontal row of hooks show work actually being performed in that stope. Cards on the second horizontal row show work planned ahead and which will follow in sequence. Thus, for example, Fig. 1 shows that in stope S101N on the 100-ft. level, the following work is in progress: drilling, shoveling, and tramming, also timbering and piping; while the following work is planned ahead:

drilling, shoveling and tramming, and timbering and piping. In stope S702N on the 700-ft. level, tramming or drawing ore from the stope is the only operation taking place, and planned ahead there is more tramming and some timbering. Fig. 2 shows the drift and crosscut board, similarly laid out and interpreted. The third board is made in the same manner.

The operation cards used are illustrated in Fig. 3. On each card can be written the *what, when, where,* and *who* of the operations. For example, the drilling card shows the date on which the work is to begin, at what part of the mine it is to take place, about how long it is to be continued, the number of the machine to be used, the number of the men who are to do the work, and any remarks necessary. The cards are filled out in duplicate. The original is used on the boards, and the carbon copy given to the shift boss under whom the designated men are working. Information as to the progress of the work is furnished by the shift bosses to the master shifter, who rearranges the cards accordingly.

The bulletin boards, arranged in this manner, show at a glance at what part of the mine work is being performed, the scope of the work, the number of men and machines doing the work, and the work planned ahead for them. From this can also be seen where and when materials and supplies are needed, so that they can be placed there ahead of time, thus eliminating many avoidable delays. The time required for arranging the cards on these boards need not necessarily be long, and it certainly will be time well spent.

Another method which arranges and shows the progress of the work is the pin-chart method used in efficiency work applied to construction. For this method a chart is made which shows the completed job, and the progress of the work is indicated by the position of the different colored heads of the pins. A color is given to each class of work, and the number of the man is attached on a small piece of paper. For example: a longitudinal section of the mine is drawn which shows all stopes, drifts, rises, and other workings in which actual work is now being performed and in which work will be done in the near future. The outlines of the workings are drawn as they will appear after all of the ore is extracted. The tacks or pins which represent the different classes of operations have the number of the worker that the tack represents stamped on the head, or the number of the worker is written on a small tag and suspended from the tack. Each class of work has a different colored tack, thus:

Machine men—yellow.
Shovelers—red.
Trammers—blue.
Timbermen—brown.
Lessees—black and white.

The machine number is written on a larger tag and suspended from the tack of the machine man who is operating that machine. These tacks are placed at the actual position on the drawing that represents the place where the men work. The most advanced position of the working face is indicated by a white tack with a tag suspended from it on which is written the date the work reached this point. Future, or planned ahead, positions of the different men are indicated by an entirely different type of tack. This type of tack is one on which small cards can be attached to the head. These cards are of the same color as the kind of work which they represent, and the worker's number and date is written on these cards.

This method is also applicable to coal mines, where it is generally advantageous to use a plan drawing of the mine instead of a longitudinal section. In case of an explosion in a coal mine, this method would indicate at a glance to outside rescue parties the exact position and number of men that were in the mine before the explosion took place. This definite knowledge would undoubtedly be of great aid in directing the rescue work.

The progress chart is used to show at a glance whether or not work is on time, ahead of time, or behind time. For example, in driving a drift, a drawing is made to scale which shows the completed work. Suppose this drift is to be 80 ft. long and it should be completed in 20 days. This would mean that an average of 4 ft. per day of progress must be maintained to complete the work on schedule time. Four-foot sections are, therefore, drawn along this drift and the date on which each position should be reached is indicated. The actual position which the working face reached each day is indicated by different colored tacks from which are suspended the date tags. A white tack indicates that the work is on schedule time; a blue tack, ahead of time; and a red tack, behind time. As can be seen, this method is of great use for contract work, as it gives both to the management and to the contractor a definite idea as to the status of the work. It is also a good incentive for increasing the output of the worker. Such charts are programs of work. When the work is completed, the tacks can be replaced by colored circles and filed, thus they remain as records.

The best planner is he who—other things being equal—is the most ingenious, the most experienced, and the best observer. It is not every man who is fitted by nature to observe closely, and hence plan. Practice in visualizing makes for increasing the faculty of constructive imagination. The man with the best constructive imagination is the best planner. These methods of visualizing are of great aid in fostering constructive imagination and the resulting work of planning. We believe this to be the first study of the possible application of this method to mining operations. Any suggestions for improving the method will be welcomed.

COAL EXPORTS from Newcastle, New South Wales, in 1914 amounted to 4,753,505 tons, a decrease of 483,116 tons. Owing to the nitrate crisis in Chile, exports of coal to that republic were 356,000 tons less. Shipping of the port totaled 1757 vessels entering, with a tonnage of 3,484,608.

The Omineca Mining Division, British Columbia

By WM. M. BREWER

The mineral resources of that portion of British Columbia which is adjacent to the recently opened Grand Trunk Pacific railroad are to a great extent unknown to the outside world, although placer gold was discovered about 50 years ago on Lorne creek, a tributary of the Skeena river, situated 130 miles from Prince Rupert, the ocean terminus of the railroad, and even

MAP OF THE OMINECA MINING DIVISION, BRITISH COLUMBIA.

today hydraulic mining operations are being carried on with satisfactory results.

Lack of transportation facilities has been a serious handicap in the past, especially with regard to mining ores that require to be smelted; therefore the pioneer prospectors confined their operations to placer mining, and although several lode mineral claims were staked as early as 1894, operation on these was confined to the assessment work necessary to hold the title and obtain crown grants.

Starting from Prince Rupert, the railroad enters the Skeena valley proper on the opposite side of the river from Port Essington, the head of navigation for deep-draft vessels, and follows along the west bank of the Skeena to a few miles from Hazelton, the head of navigation for stern-wheel steamers, about 190 miles northeast from the terminus. At that point the railroad crosses the river, and follows up the Bulkley valley toward the east.

Hazelton is the seat of government for the Omineca mining division, headquarters for the mining recorder, and general distributing centre for the neighboring mines. The most important among these are the Silver Standard, Canadian King, American Boy, Silver Cup, and Rocher Déboulé groups of mineral claims, all of which have been developed to that stage which warrants their being ranked as mines rather than prospects.

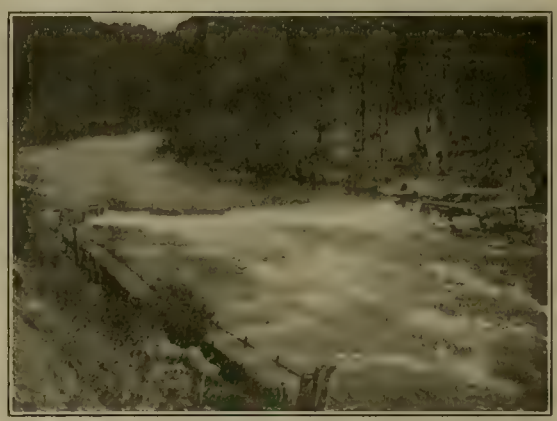
The southern portion of the division is situated in the vicinity of Kitsalas canon, one of the earliest settled places in this part of the province, as well as showing some of the finest scenery in the north.

The distributing centre for this part of the division is Prince Rupert, but for the convenience of the locality, which is situated nearly 100 miles from Hazelton, there is a deputy mining recorder's office at Pacific Station, about 20 miles northeast, and another at Terrace, about 14 miles southwest from the canon.

This southern section of the division includes the Copper river, Kleanza creek, Chimdemash creek, St. Croix creek, and Legate creek, tributaries of the Skeena river which flow in from the east, as well as Phillips creek, also a tributary of the same river, but which flows in from the west. The surrounding country is quite mountainous, some peaks having an elevation of nearly 8000 ft., but the average altitude where mineral has been discovered is from 2000 to 5000 ft. above sea-level, and from 500 to 4500 ft. above the level of the Skeena valley.

The rock formations of this area are made up of a wide belt of volcanics associated with some sedimentary rocks, the series being grouped by the Canadian Geological Survey as the Kitsalas formation. They are repeatedly intruded by granitic dikes and stocks, and in places are somewhat schistose; ordinarily they are greenish to purple massive rocks, spotted with large and irregular areas of epidote, and lined along the fracture planes with the same mineral.

The predominating ore-bearing minerals are bornite,



KLEANZA CREEK HYDRAULIC GROUND, OMINECA MINING DIVISION, BRITISH COLUMBIA.

chalcocite, chalcopyrite, iron pyrite, and gold, the latter usually being found in its free state, and can be saved by amalgamation. In Kleanza creek, placer gold has been mined for several years past; some parts of the creek have yielded satisfactory 'pay' and are still being mined by hydraulicking.

The commercial values contained in the ores referred to vary from low gold and copper to $16 gold per ton, with from 3 to 21% copper and 11 oz. silver. Usually these ores carry such low silver content as to form almost a negligible quantity, and there appears to be a

relationship between the gold and copper; or, in other words, when the gold is high, the copper is comparatively low, and *vice versa*.

The gangue material in this class of mineral claims is almost invariably quartz where the mineral occurs as vein filling, but in many instances the mineralization occurs as replacement in igneous dikes, and then the gangue is brecciated dike rock occupying a zone or zones in the dike itself. These mineralized zones are often of very considerable width; some sampled by myself last summer showed appreciable value for from 20 to 45 ft. across the dikes, and while the minerals across the entire width were not high enough to ship the ore without careful sorting—or better still, treatment by concentration—the properties certainly possess many attractive features, and apparently could be developed into producers of large tonnage.

There is one very noticeable feature associated with the occurrence of the two classes of orebodies referred to, which is, that while the veins almost invariably are situated in the mountains near the Skeena river, the mineralized dike formation is found at the high altitudes some miles back from the river, and consequently not as easy of access to transportation.

As an illustration that the country has been but little prospected, only last summer the outcroppings of a vein were found at an elevation of only 500 ft. above the valley on the eastern slope of Kitsalas mountain, within 2000 ft. of the railroad track. The quartz outcrop carried particles of free gold visible to the naked eye, and was easily traceable for about 200 ft. along the strike. The predominating mineral exposed in opencuts was bornite in the quartz gangue, and an average sample across three feet assayed: gold, $8; silver, 3.8 oz.; and copper, 7.1%. The width of this vein varied from one to eight feet. It was a clean-cut fissure in a schistose volcanic rock, with well defined walls, and a few inches of talcose gouge separating the vein matter from the wall-rock. This instance is given to show the attractiveness of the Skeena River country for prospecting, and the opportunity offered to the experienced prospector since the completion of the Grand Trunk line.

The mineralized zones traversed by the Skeena valley between Prince Rupert and Hazelton are, so far as at present known, two in number, the southerly one occupying an area from the northwest boundary of the batholith of coast granite, at about milepost 94 on the railroad, to about mile 130; while the northerly zone, known to be mineral bearing, has its southern boundary near Skeena Crossing, about 12 miles southwest from Hazelton, and extends in an easterly direction toward the Telkwa river, but its northern boundary is not yet well defined.

The southern mineralized zone extends in a southeast direction toward the coast for several miles along the mountain range which separates the Zymoetz or Copper river from the Lakelse valley, and in a northwest direction to the divide between the Skeena and Nass rivers, a distance of about 50 miles.

Mining Methods at Park City, Utah

By JAMES HUMES

*The active mines in the Park City district at the present time are the Silver King Coalition, Daly-Judge, Daly West, and Silver King Consolidated. Several other companies, such as the Daly, American Flag, and Ontario, are doing considerable development work.

In the Silver King Coalition mines the ore is a replacement of a dark silicious limestone bed, varying in thickness from 18 in. to several feet. In places the ore is 25 ft. thick. This limestone bed lies within 100 ft. of the underlying Weber quartzite. There are other lime beds, similar in appearance to this one, in Park City formation, which is approximately 700 ft. thick; but not one of them has been found to contain any traces of ore. Directly under and in contact with the ore-bearing bed is another, composed of gray lime well studded with dark concretionary nodules; and this one is an unfailing indication of the proximity of the ore-bearing bed.

These ore deposits make out from or have connection with some one of the ore-bearing fissures, which were undoubtedly the channels for the circulation of mineral-bearing solutions. It is therefore proper to run prospecting drifts in the fissures, although they seldom contain much ore.

As a general rule, driving in the fissures is not costly. Mining and 'mucking' cost from $2.50 to $4 per foot, and little timber is required. There are instances, as in the Daly fissure in the Daly-Judge mine, where the expense of keeping drifts open in the fissure is so great that it has proved economical to make the drifts in the footwall rock and run cross-cuts into the fissure at short intervals.

In the Park City mines it is not easy to determine beforehand the best method for extracting the ore from a newly discovered ore-shoot in the bedded deposits. While we may get one dimension from the drift driven in the fissure, that will not give us a correct idea as to the other dimensions of the orebody. The fissures here referred to have a north 35° east strike, and the beds dip from 10 to 30° northwest. The accompanying sketch map shows part of a worked-out orebody that has a connection with an ore-bearing fissure at the southeast end and 200 ft. higher up on the dip of the beds. It will be noticed that the 900-ft. drift was advanced a long way in barren rock, yet it was all the time in the replacement bed, and where the ore is shown at the top of the incline it was very thin and discouraging, but persistent exploration developed a fine body of ore.

The orebodies are somewhat lenticular in form, with their greatest length along the strike of the lime beds. The perimeter, except on the fissure side, is very irregular in outline. There are numerous branches, extending sometimes as much as 100 ft., and averaging from 5 to 25

*Abstract from *Transactions* of the A. I. M. E., New York meeting, February 1915.

ft. in width. Ore also occurs up and down in small fissures for a few feet, and there are 'rolls' in the foot-wall that make the beds almost vertical for from 5 to 25 feet.

Most frequently the ore dips down from the fissures (that is, the north-dipping fissures); and if a drift in the fissure has cut the ore it is worked down as far as possible by shoveling out the rock. If it persists in going down, a small hoist is rigged, of which there are a dozen in the Coalition mine, ranging in size from a Holman stretcher-bar hoist to a double-cylinder 35 hp. These little hoists enable us to raise the regular mine cars. If the angle is too steep for a direct pull, simply fasten the end of the hoisting rope to a post at the top of the inclined winze, and pass it through a 7-in pulley which is hooked into the car. This method gives the engine a double purchase; and even with the little double-cylinder

SKETCH MAP OF WORKED-OUT OREBODY.

5 by 6-in. engines we are seldom unable to manage the 18-cu. ft. cars. If the deposit is too thin, enough of the bottom is taken up to admit the car. Often the temporary inclines will meet with a face of barren rock. In such cases we do not cut through the waste, but turn the rails to the right or left, as the case may be, and follow the ore. (See sketch.) Should the ore continue down on the dip for a considerable distance, small drifts are run right and left from the main incline, in which is used a small special car, dumping its contents into a hopper that connects with the car on the main incline. Should there be a sufficient thickness of ore at the point where we wish to run one of these sub-levels, we simply put down a track switch on the main incline, the points of which are thrown with a lever on the level that is connected with the points by means of a long rod, crank, and short rod, and in this way we are able to load the mine cars that are hauled to the ore-bins on the surface.

An experienced miner, reading these lines, will probably ask himself the question, 'Why don't they do their development work from the lower edge of their orebodies?' As I said before, it is impossible to predetermine the outlines of such orebodies. At the time this property was taken charge of, there were many schemes for moving the ore from the faces to the levels. The best and easiest of application was the shaking chute, but as time went on, the thought of trying any of them was abandoned. At the present time, as much underhand as overhead stoping is done, and in doing so a great deal of development work is avoided. Most of the time the deposit is so flat and thin that it is impossible to use a stoping machine to advantage, so that most of the mining is done by the 'single jack' method. Sometimes the ore is only a few inches thick, but it is not abandoned until there is no sign of ore, as many times a small stringer has led to a large deposit. The cost of mining ore here ranges from $1 to $4 per ton.

I understand that the above methods prevail in all the mines here where they are mining the replacement deposits. Following is a scale adopted by the Daly-Judge Mining Co. for driving drifts and cross-cuts with Leyner machines, the Company furnishing all supplies:

Average footage per shift.	Machine men.	Machine helpers.	Muckers.
Less than 3.5	$3.25	$3.25	$3.00
3.5 to 4.0	3.50	3.25	3.00
4.0 to 4.5	3.75	3.50	3.00
4.5 to 5.0	4.00	3.50	3.00
5.0 to 6.0	4.25	3.75	3.25
6.0 to 7.0	4.50	4.00	3.25

Costs at the Sons of Gwalia Mine

This property is at Leonora, Western Australia, about 140 miles northeast of Kalgoorlie. The main incline shaft is down about 3000 ft., and the mill contains stamps, grinding-pans, leaching tanks, filter-presses, and vacuum filters. Costs during 1913 were as follows:

Operations.	Per foot.
Shaft-sinking	$96.18
Station-cutting and shaft bins	0.39
Driving	18.56
Cross-cutting	17.84
Rising	16.50
Winzing	22.30
Diamond-drilling	5.30

Total development was 7640 ft., with 2433 ft. of drilling and 11,244 cu. ft. of cutting, the whole costing $1.07 per ton of ore milled.

COST PER TON MILLED

Development	$1.07	Disposal of residue	$0.07
Ore extraction:		Clean-up	0.12
Breaking ore	$1.66		
Filling stopes	0.05	Total milling	$1.67
Tramming and hoisting	0.52	General expenses:	
		Salaries and wages	$0.20
Total mining	$2.23	Sundry	0.08
Treatment:		Maintenance and supplies	0.01
Rock-crushing	$0.12	Rent and insurance	0.10
Ore transport	0.05		
Stamping	0.31	Total general	$0.39
Filter-pressing	0.54	Bullion realization	0.06
Leaching sand	0.14		
Fine grinding	0.32	Grand total	$5.42

The plant treated 162,101 tons of ore yielding $7.50 per ton. Dividends totaled $312,000.

COAL MINE ACCIDENTS in England in 1914 totaled 1210, compared with 1753 in 1913 and 1276 in 1912.

Economical Use of Explosives

By R. NOBLETT

It seems worth while to set forth to mining men, and especially to the miner, some of my experiments, their results, and conclusions reached in the economical use of explosives in mining. Most of these experiments were made with the explosives most generally used, 40% dynamite and 40% gelatin. My first experiment was made when driving a drift which required seven holes to each round. This drift was driven about 200 ft. before I went into it. The rock was soft and easily broken with powder. As it was a prospect drift, the manager wished to drive it without timber if it could be safely done. The round was composed of one back-hole, two breast-holes, two cut-holes, and two lifters. This round of holes was in general use at the mine when driving in country rock, and thousands of feet of driving was done each month.

The charge of powder in general use for each round was 36 sticks of 40% gelatin. I began my work in the drift with 32 sticks to the round. Three sticks was the charge given the back-hole, and it was found to be too much. I reduced it to two sticks and used two sticks of tamping on top of the charge. I made the sticks of tamping by wrapping paper around the loading-stick, closing the paper over the end of the stick, withdrawing the stick and filling the paper tube with dry drillings. To my intense surprise, this charge was worse than the former one of three sticks. I reduced it to 1½ sticks, and found that too much, and finally reduced it to one stick. I ran that drift more than 300 ft. using one stick, and found it to be ample.

Having succeeded so well in this experiment, I turned my attention to the two breast-holes; I had been using 4 sticks to each of these holes (most of the miners were using 5). I reduced from the 4 to 3, using 1 stick of tamping to each hole. I could see no difference in the breaking, so I reduced the charge to 2½ sticks, with 2 sticks of tamping to each hole. I found by that trial that it was not safe to make any further reduction. I then turned my attention to the cut-holes. I was using 5 sticks to each of these holes; I reduced this to 3½ sticks with 2 sticks of tamping. This charge I used for about two months and it never failed; in fact I got better results with 23 sticks to the round than I had when using 32. I found also that this reduction in powder was making enemies for me, and made no attempt to reduce the charge in the lifters. In fact I was compelled to report more powder than I used each shift.

In regard to the tamping, I have used this same form in rises and stopes as well as drifts, and prefer it to any other kind or form. It most certainly pays for the time and paper required to make it. It is easily and quickly prepared especially in stopes or rises where drillings are plentiful. It is not good practice to ram the tamping when working in soft or medium rock. Press it in the hole in much the same manner as the powder is pressed. The expanding gases will do the ramming for you. In very hard rock the tamping must be well rammed to get good results, and care is needed in its preparation. It must contain no small pebbles which could injure the fuse. Even in hard rock I have found the loading-stick to be all that is required in doing the tamping.

I shall give here no further details of experiments made in hard rock, but will state one conclusion that was forced upon me after many tests. These tests were made in the 'black sulphide' rock commonly occurring in copper mines. This rock generally has a distinct cleavage, sometimes slaty but more often angular. When the cleavage is marked, a strong explosive will give better results. That is, a 60% dynamite will do more work for the same cost than 40% will. It will also be found to be safer when properly used; one reason why it gives better results is that it is quicker; another is that the charge can be placed nearer the bottom of the hole, *where it should be*. There is more danger in using explosives in this kind of rock than in any other that I know of. Not only is the rock black, giving poor reflection from the miners' light, but everything in sight is black. If there should be a stick of dynamite in the broken rock it is not likely to be seen by the men at work. The rock is very heavy and hard to shovel, requiring frequent use of the pick. It is almost certain that the pick will find the lost powder first. The use of a stronger explosive places the charge farther from the collar of the hole, making it safer for that reason. In massive rock, that is, rock having no pronounced cleavage, the stronger explosive does not give results such as to justify its use in general mining work. I have taken more space than I intended in beginning, but with the Editor's kind permission I would like to say a few words to the miners who may read this. In the first place, no man can from a distance tell a miner how much powder he needs to use in his holes. He can only suggest investigations to see whether the same work cannot be done with less, always keeping in mind the fact that the less powder used, the less is the danger from it. If you used none at all there could be no danger at all. My advice to the miner is to be careful with what you use, and cut your fuses with a sharp knife, one that will not mash the end so that it cannot spit fire into the cap. This is the cause of many missed holes, and if you have no missed holes you will lessen the danger for everyone about you. Do not accept old customs altogether, but do a little experimenting for yourself.

BULLION TRANSACTIONS at the San Francisco Mint in February were as follows: gold received, 248,191.6 fine oz.; silver, 96,844.8 fine oz.; domestic coinage, gold, $2,980,000; silver, $72,000; copper, $14,000; and for the Philippines, silver ₱47,000. Gold, bullion, etc., on hand at the end of the month amounted to $264,708,040.19.

CRUDE OIL SHIPMENTS from Tampico, Mexico, to the United States in January amounted to 841,355 bbl., as against 1,093,431 bbl. in that month of 1914.

Mineral Production of Canada, 1914

John McLeish, chief of the Division of Mineral Resources and Statistics, Canada, presented his preliminary report on the mineral production of Canada for 1914, the figures being subject to revision, at the Canadian Mining Institute meeting, March 3. The total value was $128,475,499, as compared with $145,634,812 in 1913, being a decrease of $17,159,313, or 11.8%. The total value of the metallic production was $58,870,028, as against $66,361,351, a decrease of 11%. The production of the more important minerals was as follows: Copper, 75,738,386 lb.; value, $10,301,935; decrease, $1,451,671. Gold, 770,374 oz.; value, $15,925,044; decrease, $673,879. Pig iron, 783,164 tons; value, $10,002,856; decrease, $6,537,156. Lead, 36,337,765 lb.; value, $1,627,568; decrease, $127,137. Nickel, 45,517,937 lb.; value, $13,655,381; decrease, $1,247,651. Silver, 27,544,231 oz.; value, $15,097,269; decrease, $3,943,651. Other metallic products, value $1,123,919, decrease $189,813. In making up the total value as above given, $8,863,944 is deducted from the figure for pig iron, being credited to imported ores. Of the non-metallic products, the principal decreases are in coal, which was produced to the amount of 13,433,108 tons, of the value of $33,433,108, a decrease of $3,901,832, and clay products valued at $7,090,898, a decrease of $2,413,416.

Thomas W. Gibson, Deputy Minister of Mines for Ontario, in presenting the report of the mineral production of the province for 1914, said that the decrease as compared with 1913 was principally in the items of silver, nickel, and pig iron. In his opinion the maximum production of Cobalt had been reached, and future years might be expected to show a diminution in the output of silver. The lessened production of nickel and pig iron was mainly due to the war, and the slackening of activity in the building trade naturally affected building material. On the other hand, there had been an increase in gold production due to the development of the Porcupine field. The report gave the total value of mineral production at $46,632,105, of which $33,869,497 was metallic, as compared with $53,232,311 total production, of which $37,507,935 was metallic, in 1913. The principal items on the metallic list were as follows: Gold, 268,942 oz.; value, $5,529,767. Silver, 25,999,374 oz.; value, $13,209,726. Copper, 14,453 tons; value, $2,081,332. Nickel, 22,760 tons; value, $5,109,088. Iron ore, 240,059 tons; value, $531,379; and pig iron, 556,112 tons; value, $7,041,079.

Theo. C. Denis, Superintendent of Mines for Quebec, stated that the decrease in production in that province amounted to 13.7%. The main falling off was in asbestos, for which Germany is an important customer, but the industry is recovering, and shipments to the United States are increasing. The production of magnetite is also likely to increase. The preliminary report showed a total production of the value of $11,325,428, as compared with $13,119,811 for 1913. D. B. Dowling presented some statistics furnished by John Stirling, mine inspector of Alberta, showing that the coal output of that province showed a decrease of some 445,039 tons. This was largely due to a decline in railway activity, and the opening up of other mines farther west. The production for 1914 was 3,667,816 tons.

Costs at the Lake View & Star Mines

These properties and mill are at Kalgoorlie, Western Australia, and costs according to the last annual report were as follows:

	Cost per Ton		
Development	$0.40	Preliminary grinding	$0.17
Ore extraction:		Agitation	0.50
Breaking ore	$0.92	Filter-pressing	0.25
Filling stopes	0.09	Clean-up	0.06
Tramming and hoisting	0.63	Disposal of residue	0.11
Total mining	$1.64	Total milling	$2.23
Treatment:		General expenses:	
Rock-crushing	$0.05	Salaries and wages	$0.11
Ore transport	0.06	Sundry	0.02
Stamping	0.34	Maintenance and supplies	0.01
Concentrating	0.14	Rent and insurance	0.04
Roasting concentrate	0.12	Total general	$0.18
Cyaniding concentrate	0.06	Realization of bullion	0.04
Fine grinding concentrate	0.04	Grand total	$4.49
Fine grinding sand	0.33		

Mining is being done below 1900 ft. in the Lake View mine, and 900 ft. in the Hannan's Star, which are about a half mile apart. The mill treated 216,043 tons of ore averaging $6.52 per ton.

The Hollinger Mill's Record in 1914

The report of the general manager (P. A. Robbins) of the Hollinger Gold Mines, Ltd., for the past year contains the following information:

Hollinger ore treated, tons	208,936
Average value per ton	$13.676
Total value sent to the mill	$2,857,398
Ore treated, tons per day	583.59
Time operated, per cent of possible	92.2
Ore treated per 24 hours of running time, tons	632.97
Stamp-duty per day of running time, tons	13.3
Unrecovered gold:	
Concentrate stored for re-treatment	$53,686
Lost in filter residue	$116,879
Total	$170,565
Bullion recovered	$2,719,354
Value of tailing, per ton	$0.56
Chemical consumption, pounds per ton of ore:	
Cyanide	0.525
Lime	1.557
Zinc	0.532
Acid	0.216
Lead acetate	0.003
Solution precipitated per ton of ore, tons	2.315
Zinc added per ton of solution, pounds	0.230
Average value of pregnant solution	$5.698
Cost per ton	$1.237

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

Precision of Thought

The Editor:

Sir—It does not seem to me that you, in your editorial of November 7, 1914, or Mr. Prosser, in the issue of December 5, or Mr. Nevius, on January 16, have taken the right view of the use of the verb in the sentence: "Of the tonnage hoisted, 626,000 tons *were* crushed." Your editorial states that your correspondent made an error in using *were*, because "to say that 600,000 tons *were* crushed would imply that each ton was separately crushed, like 600,000 walnuts cracked with a hammer. But this was not the process employed; a quantity which is expressed in terms of tons was crushed, and no individual entity is implied."

In my opinion your correspondent's use of *were* is fully justified by the usage of educated people—the only criterion that we have for correct English—and in changing *were* to *was* you have abused your editorial privilege: I also think that your reasons for making this change are wrong. However, realizing that my own views are of but little importance, I have asked the opinion of several authorities whose opinions ought to convince you of your errors.

What struck me very forcibly when I discussed this question with various linguistic experts is that there is no known authority whose word they recognize as final in disputes as to correct English. It would certainly save a vast amount of discussion if English-speaking peoples had something corresponding to the French Academy. I fancy that few engineers realize the intricacy of English grammar, but foreigners are rendered frantic by its confusion, and I once met a Russian who was so irritated by struggles with spelling and grammar that he became convinced that English was not a real language, but a mere jargon of French and German. As regards printed grammar, he certainly had some ground for his assertion, and the following quotation from the report of the Joint Committee on Grammatical Nomenclature is illuminating. This committee was appointed by the National Education Association, the Modern Language Association of America, and the American Philological Association. I quote from the preface to the report: "* * * the present state of things is deplorable. In the very desire for betterment, we have reached a multiplicity of terms, even for grammatical relations about the nature of which there is no real difference of opinion, as, for example, those seen in the italicized words in 'John is *good*,' 'This is *John*,' 'I admire *John*,' 'We made John *president*.' For the first of these, there are nine different names in twenty-five of the English grammars in use in the United States today; for the second, ten; for the third, seven; and for the fourth, eighteen. Thus 'good' in 'John is *good*' is variously called, according to the grammar used, *attribute complement, predicate adjective, subject complement, attribute complement or predicate adjective, subjective complement, complement of intransitive verb, predicate attribute, adjective attribute*, and *predicate*. The result of such a state of affairs is almost hopeless confusion. * * *"

The above quotation shows such a great variety of views as to the structure of English that it seems likely there will be considerable divergence of opinion as to what constitutes correct English; and this is true, for there are a number of books in which the English of our best writers is said to be full of errors, and a second lot of books in which the English of these critics is criticized. As far as I know, the last book of this sort is 'The King's English,' wherein the authors find the English of a very large number of our best writers violating rules of grammar. The following list is representative of the authors criticized, and could easily be enlarged: C. Brontë, Carlyle, De Quincey, Dickens, George Eliot, Emerson, Gladstone, Huxley, Kipling, Macaulay, Meredith, Prescott, Ruskin, Scott, Stevenson, H. Sweet, Thackeray, and R. G. White.

But, in spite of the conflict among grammarians and the difference of opinion as to what constitutes correct English, all authorities agree that we cannot go wrong if we follow the usage of educated writers; this rule is well set forth in the following:[1]

"It cannot indeed be laid down too emphatically that it is not the business of grammarians or scholars to decide what is good usage. Their function is limited to ascertaining and recording it. This can only be done by the prolonged and careful study of the language, as it has been employed by its best authors. It is they who settle by their practice what is correct or incorrect, and not the arbitrary preferences or prejudices of writers on usage or grammar. These constantly assume an authority to which they are not entitled. Ignorant of their own ignorance, they condemn because they fail to understand. The grammar of different periods does, it is true, vary to some extent. What is right at one time may be wrong at another. Still, as a general rule, he who studies faithfully the great masters of English literature need rarely feel any hesitation about adopting the

[1]Lounsbury, T. R., 'History of the English Language,' p. 187.

words or phrases or expressions which have received the sanction of their usage."

Another author states:[2] "If we know what a man means and his usage is in accordance with that of a large number of intelligent and educated people, it cannot justly be called incorrect."

As our only guide for correct writing is usage, I have thought it worth while to find out the usage of educated and intelligent men, namely, the professors of science in Stanford. In order to obtain an independent opinion, I handed your editorial to the professors mentioned below, and without giving them any hint as to my own views, asked them what they thought of it. G. H. Clevenger, metallurgy, said that before he read the editorial he would have written *were*, but is now convinced that *was* is better. D. M. Folsom, mining, has had the question called to his attention before, and would naturally have written *were*, but now would write either *were* or *was*, depending whether he wishes to give the impression of unity or continuous operation. C. F. Tolman, geology, would use *were*. Victor West, political science, considers *was* wrong and would use *were*. In all these cases it seems evident that *were* would have been the natural usage, and that any preference for *was* is due to your editorial.

I think that the opinion of the above professors is enough to show that *were* is justified by good usage and that there is no use in adding further testimony to the same effect. Thinking that you might perhaps remain unconvinced by the above testimony, I also thought it worth while to obtain the opinion of scholars who have made the study and teaching of English their life work and who have for years constantly discussed this question of the agreement of subject and verb, and I have procured the following statements:

Raymond M. Alden, professor of English, Stanford:

I have read the editorial you showed me with interest. Its general doctrine is certainly a good one; the only trouble is with the particular case on which it is based. 'Ton,' of course, is not a collective noun in the sense in which the writer uses the word; otherwise we could say "a ton were broken up," as he—very properly—points out that we can use a plural verb with 'football team.' In any case, the rule that a collective noun may take either a singular or plural verb does not mean that it can ever be used *in the plural* with a singular verb. That is, we can never say "the football teams was." In one case only could '40,000 tons' be used with a singular verb, viz., such a sentence as "40,000 tons was the phrase he uses;" in this case the subject of the verb is thought of as the *phrase* '40,000 tons'—not the mass of coal as a whole.

W. H. Carruth, professor of Comparative Literature, Stanford:

The article on 'Precision of Thought' in the *Mining and Scientific Press* contains some good illustrations of the difficulties arising over agreement of verb and subject where the noun is collective. However, in the case under discussion the subject is not a collective noun, but a noun of measurement, 'ton.' In the sentence quoted it seems to me to depend on the writer's thought and intention whether the verb is to be 'were' or 'was.' Looked at from the editor's point of view, 'was' is correct. If the writer thought of the ore as fed out in tons or parcels, he was justified in using 'were.'

G. R. Noyes, associate professor of Slavic Languages, University of California:

Personally I should prefer "626,000 tons *was* (Editor—Please spell crusht.) crusht," on the ground that the idea is that of a singular collective; '1,252,000,000 pounds' would express the same idea—whether one specifies tons or pounds is a matter of convenience. "626,000 bars of iron *was* crusht" w'd of course be wrong, since one thinks of the crushing of each separate bar, not of the whole heap. But while I prefer "626,000 tons was crusht," I should not regard "626,000 tons were crusht" as incorrect. I agree with you that the decision of the question depends on the intention of the writer and is a question of taste rather than of right and wrong.

S. S. Seward, Jr., assistant professor of English at Stanford:

The question you put does not seem to be one of right or wrong, but one of precision. I agree with you that the context makes 'were' preferable. If another chooses to use 'was,' I should have no quarrel with him. But if he should declare that 'was' alone is right, I should think that his attitude toward the English language was pedantic.

C. S. Downes, assistant professor of English, University of Illinois:

In regard to the editorial, I showed the clipping to Professor Scott, one of the older professors here. He and I agree that both forms are used. 'Was' is more logical, in this passage; but good writers of English are not always the most logical. Scott said he considered 'was' better when you mean "a quantity of so many tons, pounds, etc." But he added that he should not change anybody else's 'were' to 'was.' I agree with him perfectly.

A study of all the opinions[3] that I have given above convinces me that you are in error in condemning the use of 'were' by your correspondent, for it is justified both by the usage of the technical professors whom I have quoted and by the authority of the language professors. It seems that besides being in error with regard to the use of 'were' that you are also wrong in some of the reasons that you have given for the use of 'was.' You base the use of 'was' on the assumption that ton is a collective noun, which is an error—as pointed out by professors Alden and Carruth. But even if ton were a collective noun you should have written 'were,' for a collective noun in the plural is always followed by a plural verb (see professor Alden's statement).

Although the English professors who prefer 'was' are very likely to show good taste in such preference, yet, as a mining engineer, it seems to me that your employment of 'was' is likely to divert a reader's thought from a consideration of the technical subject under discussion to a question of grammar. And thus you are probably violating what Herbert Spencer calls the principle of 'economy of attention.' For a technical writer should have "for his supreme object" the conveying of "his

[2]Mathews, Brander, quoted from G. R. Carpenter in 'Parts of Speech,' p. 98.

[3]I wish to express my thanks to the gentlemen who have so kindly given me their opinions on the 'was' *versus* 'were' problem.

thought into the minds of his readers with the least friction.'' And certainly anyone who reads your sentence with its 'tons was' attentively would instinctively stop and ask what led you to use this singular verb with a plural subject instead of following the discussion with regard to the ore. From the point of view of a mining superintendent your use of *was* is forced and unnatural, for the image evoked by the sentence is that of plurality. Apparently you do not have the same vision that I do. When I think of 'tons hoisted' I see a shaft with cages rising and lowering and men handling cars, and when I think of a mill I have the image of stamps dropping and multiplicity. You, on the contrary, evidently see a mine in which a block of 626,000 tons is detached by some unknown method and hoisted in one lump by some monstrous mechanism. And your imagination must have invented some gigantic mill that crushes the whole 626,000 tons at one fell blow.

The above seems a lot of writing about a minor matter, and I think it as well to explain that I do not object to your use of 'was' or of 'were' in the sentence under discussion. I do, however, decidedly object to your correcting your correspondent's perfectly good English.

W. H. Shockley.

Palo Alto, California, February 15.

[It gives us great pleasure to print Mr. Shockley's interesting letter, and even greater to point out that his argument from usage sustains us, instead of himself, since of the nine men consulted five agreed to the use of 'was,' and only four adhered to 'were.' Mr. Shockley also goes astray in failing to recognize that mining men are the guardians of their own gates of speech, and as to the best use of words in literature dealing with mining the opinions of two well educated, thoughtful, and careful mining men are more weighty than the views of a half-dozen professors of non-professional literature. A distinction must be drawn between common usage and the best usage. If it were possible to ascertain the usage of all of the hundred million people of the United States it would undoubtedly be found that a majority of them say 'ain't' instead of 'are not.' Pushing this argument to its conclusion, it is quite possible that the usage of one thoughtful writer may be the best usage, as compared to the practice of many other writers who have never given special thought to all the factors governing that case. For example, a few years ago, T. A. Rickard alone made a distinction between the use of 'tailing' and 'tailings.' Now probably a majority of careful writers in the mining profession use 'tailing' to designate the product of a single mill or machine and 'tailings' to indicate the product of several; a distinction that obviously tends toward clarity and precision. Finally, it gives us malicious pleasure to point out that Mr. Alden, professor of English at Stanford, with whom Mr. Shockley concurs, is clearly in error. We can not, indeed, say ''the football teams was,'' but not for the reason he assigns. 'Football team' is a collective noun; 'football teams' is a plurality of collectives, and requires a plural verb for exactly the reason cited in the original editorial, since the football teams do not act as a unit, but as different, and commonly opposing, collectives.—Editor.]

Amalgamation in Hardinge Mills

The Editor:

Sir—The following data cover a definite case. I was the man on shift; I fed the quicksilver: I crawled inside the Hardinge mill at clean-up time, and I know the condition of the amalgam as I found it. The sketch shows the flow-sheet, excepting the Pierce amalgamator.

The articles by Messrs. Caetani and Kiliani, and the comment and questions by Mr. Girard seem to show that much interest has been aroused among millmen by the departure from standard practice at the Plymouth mill. From reading Mr. Caetani's article, one might assume that he built a very efficient crushing unit and lost sight of the fact that the business of a gold mill is to get the gold. I see no reason why amalgamation in the stamp-battery followed by the Hardinge mill should be attended by any more difficulty than amalgamation in the stamp-battery alone.

When I arrived at the plant referred to, amalgamation was done on the plates only. Shortly after, this was changed to feeding quicksilver to the Hardinge mill, with a marked improvement in results. Later this was again changed to feeding quicksilver to the batteries, with a further improvement in results, as we were informed. During the first part of the campaign the amalgam on the plates was maintained very hard, being removed by scrapers, one of the plates being cleaned up each 24-hr. period. The Hardinge mill was cleaned up at the end of the month, by having the manhole cover removed and the screen adjusted, and the mill was revolved and all sand and possible amalgam allowed to fall out. The screen was then removed, and a man entered the mill to see what was inside. Considerable amalgam was found in the spaces between the silex brick, but by far the largest amount of the amalgam found in the Hardinge was stuck fast just inside the throat of the mill at the points marked A and B on the diagram, and was very hard, a hammer and cold chisel being necessary to remove it. Considerable amalgam was also found in the throat, both at feed and discharge ends, and also in the feed scoop, stuck tight, and I recall that we removed the scoop to get at it better. No hard balls of amalgam were found in or around the Hardinge mill, but we did get the hard balls in the batteries around the dies. Also, the small cones, feed, and discharge boxes of the Hardinge mill and the distributing box above the plates seemed favorite places; hard chunks would build up in most unexpected places. Nail heads in launders and boxes were always covered with amalgam. I do not recall that we got anything from the sand and loose material inside the Hardinge mill.

Later on the plates were kept softer and the amalgam more pasty; scrapers were scrapped, and the rubber

used. Amalgam built up much faster on the plates, one being cleaned every day, or more than one if it seemed advisable. At the monthly clean-up the Hardinge mill was a disappointment, also the mortar-boxes, and the largest quantity of amalgam on this run was obtained from the plates; and we were told that the extraction had reached expectations. I have no means of knowing the mercury losses, but do not believe that they were excessive. The ore was principally limonite, some quartz and clay. A Pierce amalgamator placed below the plates never got anything but dirt, although dressed daily once each 8-hour shift.

FRANCIS O'BOYLE.

Luning, Nevada, January 28.

Gold Production of the Philippines

The Division of Mines of the Bureau of Science, in a preliminary estimate published on February 6, places the value of the gold produced in the Philippine Islands during 1914 at ₱2,406,867. These figures are not final, inasmuch as returns from the various mining companies are not yet all in, and it is probable that later data will vary slightly from the above total. The 1914 production was nearly 39% greater than in the previous year, which was ₱1,736,724. A little more than half of the 1914 production is the result of lode mining, the remainder having been produced by dredging.

The estimated value of the silver produced in 1914 is ₱16,000. There is no mining of silver ores in the Philippines at present, this production being the by-product from gold ores, or dredging.

Estimates are not yet completed for the output of other mineral products during 1914, but the returns are coming in rapidly, and within a few weeks the total mineral production for the past year will be available.

MINERAL PRODUCTION of Quebec in 1914 was valued at $11,325,428, compared with $13,119,811 in 1913, and $11,187,110 in 1912. The principal contributors last year were as follows: asbestos, 107,401 tons, valued at $2,895,935; cement, 2,840,436 bbl., and $3,325,055; brick, 136,885,000 and $1,093,731; copper and sulphur ore, 117,778 tons and $801,129; limestone and marble, $1,566,-145; and granite, $561,900. Gold, silver, zinc, and lead ores were worth $21,084, $31,809, and $15,490, respectively. There were 6756 men employed in mines, quarries, and plants, against 8611 in 1913, receiving $4,138,-059 in wages. Out of 133 accidents there were 9 fatalities.

AT the recent meeting of the Lake Carriers' Association, held at Detroit, and attended by about 350 vessel owners, it was decided, in view of the limited freight in sight for the coming season, that no vessels would be placed in commission for the sailing year of 1915 until June. This action will result in shortening the season and allow a more equitable distribution of the business.

CONCENTRATES

Readers of the MINING PRESS *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

SHAFT SINKING at the Brunswick Consolidated mine, Grass Valley, California, cost $91.94 per foot in 1914.

OSMOTIC PRESSURE is a force which operates the phenomenon of diffusion. The measurement of osmotic pressure is a means of sharply distinguishing between crystalloidal and colloidal matter.

TEMPERATURE affects anthracite coal consumption considerably. February was 6.5° above the normal daily average to the 26th, and the output will not be over 4,120,000 tons, about the same as in that month of 1914. A period of heavy water has also added to the operating expense.

SOME 'DONT'S' for steam-shovel operators are as follows: Don't start to swing until the dipper has cleared the bank, too much haste eventually will mean broken boom and dipper sticks; and don't continue to pull the dipper through the bank after the dipper has become filled, otherwise power will be wasted.

ANTHRACITE is eminently a product to be used in great cities, and the existence of New York, Philadelphia, Pittsburgh, Buffalo, Newark, Jersey City, Rochester, Syracuse, Scranton, Paterson, and Albany, whose populations aggregate 8,600,000 persons, accounts to a large extent for the great proportion of the output sold in the states of New York, New Jersey, and Pennsylvania. The city of New York alone absorbs over 10,000,000 tons of anthracite per year.

AN EFFICIENT quicksilver reduction plant of 50-ton daily capacity will cost about $25,000, according to C. A. Heberlein, and there should be a considerable tonnage of ore in sight to warrant such an outlay. At the Oceanic mine, Cambria, California, mining costs are very low. Reduction costs are as follows in a 50-ton plant:

Labor.	Per shift.	Charge.
Three charge men	$2.50	$7.50
Three furnace men	2.50	7.50
One helper	2.50	2.50
One foreman	3.50	3.50
One-half cord of wood	5.00	2.50
Total on 50 tons		$23.50
Per ton of ore		0.47

Adding the handling of the soot in the retort, the total cost is about 50c. per ton of ore. With a recovery of 91%, or 5.91 lb. of quicksilver per ton, worth 50c. per pound, the value recovered would be $2.95 per ton, and the total cost would be $1.50 ($1 for mining and 50c. for reduction), leaving as net profit per ton of ore, $1.45. This is but a small margin of profit, and it is evident that at the figures named, close management and a large tonnage of ore are necessary to make a successful business.

ACCIDENT DATA at the Raritan Copper Works, Perth Amboy, New Jersey, were as follows in January:

Men employed	562
Total accidents	6
Incapacitating accidents	6
Non-incapacitating accidents	0
Men injured, per cent	1.07
Men injured, January 1914, per cent	2.78
Decrease, per cent	61.51
Average injuries per hundred men since September, 1914, per cent	1.18
Total hours lost during January, 1915	677
Equivalent wages	$153.98

GRANITES are generally regarded by operating miners as unfavorable country rocks in which to look for workable gold-bearing veins. The ground for this belief doubtless is found in the fact that granitic magmas are more likely to be the source than the home of quartz veins, though the dike material in which the great Treadwell orebodies occur is an albite-diorite which was formerly designated as granite. Granites are important in giving rise to contact orebodies, but the ore is apt to occur in the limestones or aluminous rocks which have yielded to the contact metamorphism. It must be remembered that many of the granites are very ancient rocks, and observation goes to show that most orebodies are the product of comparatively recent geologic processes.

THE METHOD of shooting old drill-holes to prove them, rather than to drill a new hole near them, is being done by J. M. Short, operator of many large mines in the Joplin district, Missouri. He has found the system satisfactory, and at the same time has shown that some of the early-day drill records were much exaggerated. He uses a heavy wire to lower the powder into the old holes. He makes loops in this wire one foot apart for a distance equal to that of the unopened orebody. For example, if the old record stated that pay-dirt was found at 100 ft., and continued down to 150 ft., he makes 50 loops and attaches thereto 50 clusters of 60% dynamite, using from six to ten sticks in each cluster, according to the hardness of the ground. He uses insulated wire for firing, placing exploders in at least two of the sticks of each group. The shooting loosens the dirt on every side of the old hole, and an average of the ground can be obtained by hoisting out several sand-buckets of the ore and having it assayed.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

HOUGHTON, MICHIGAN

FULL TIME BEING WORKED IN THE COPPER MINES, AND DEMAND FOR METAL.—HANCOCK RESUMES.—QUINCY WAGES AND FIRST AID.—NOTES ON THE IRON RANGES.

With the return of the large producers to full time schedule, the mines of the Lake Superior copper district are showing noticeable gains in production each month. The Calumet & Hecla, Copper Range Consolidated, Osceola Consolidated, Quincy, Ahmeek, and Isle Royale all showed increases in February. If this increase can be continued, by the end of March the district should be showing practically normal production again. The mining companies of the copper district have experienced trying conditions in the past 18 months, and the return to normal production will mark a notable event in the history of the district. In one or two of the mines richer ore is being found in the lower levels. The increased production is forcing the mills to their full capacity.

There appears to be an urgent demand at present for immediate shipment of copper from the Michigan district. Instead of storing the refined copper, as has been the custom in previous years, the smelters are making large shipments daily by rail to the East. With the close of navigation last fall, the smelter docks and yards were entirely cleared of copper, another unusual condition in the Michigan district. So urgent is the demand, that a few weeks ago, when a shipment was made to a firm in New Jersey, the consignee furnished a man to accompany the consignment from the smelter in Michigan to the works in the East.

The Hancock mine resumed operations with a large number of men on March 1. The mine had been closed for seven months, and the present force will get the workings in shape for production. Hoisting will commence as soon as possible, and all the ore will be stored until the Franklin mill is ready to start. R. M. Edwards, president of the Franklin Mining Co., states that the Company contemplates reopening the stamp-mill in about 60 days, or as soon as the Allouez conglomerate lode is ready to supply 'rock.' Arrangements have been made to treat Hancock and New Arcadian 'rock,' as well as South Lake when that mine starts shipping.

The Champion Copper Co. has declared a dividend of $1 per share. No dividends were paid during 1914, the last being $1 paid October 15, 1913. The St. Mary's Mineral Land Co. owns 50,000 shares of Champion.

It is reported that the Nonesuch sandstone, the copper-bearing formation at the White Pine mine, carries appreciable amounts of gold and platinum. It is further reported that gold has been found in the same formation ten miles west at the Smith explorations.

It has been reported that the Quincy Mining Co. has granted an increase in wages to employees, beginning March 1. In the deeper levels, Quincy is finding a richer grade of ore. This fact will be well worth studying, and may perhaps help to answer the question as to whether the copper content of the Keweenawan 'rocks' actually decreases with depth. Thirty-one employees of the Quincy company have been presented with 'First Aid to the Injured' certificates. These were received by graduates of the course commenced two years ago by A. F. Fischer, chief of the medical staff. A new and larger class has been started in this study. The certificates state that the holder has attended the full course of lectures, which consists of a 20-minute address and one hour of demonstration, once a week for three months. Physiology and anatomy are studied in the class periods. The certificate bears the name of the graduate, his picture, the first aid corps seal, and the date of issue. A drilling record of 11 ft. in one shift was recently made at the Quincy mine with one of the new machines, which was taken down and set up four times during the shift.

During February there was some improvement in the Michigan iron districts. However, stockpiles are too large, and this interferes with securing favorable market prices. With large stocks of unsold ore at nearly all the mines, and storage room generally crowded to the limit of capacity, things have been quiet on the Marquette range.

The Lake Angeline mine at Ishpeming was closed the first of the year. The Company was loading its output into railway cars which were to be held at the mine until the opening of the shipping season next spring, and had filled 140

STAMP-MILL, BOILER-HOUSE, AND CRUSHING PLANT AT THE WHITE PINE MINE OF THE CALUMET & HECLA.

of these when the railroad company sent word that it could supply no more. Mining was then discontinued. The ore was coming from the side-hill above the old workings, and could be handled at a profit only in this way. F. Braastad, of Ishpeming, applied to the Jones & Laughlin Co. for an option on the Lake Angeline mine and offered to buy the property at a price equal to the amount of assessment or to lease it on a royalty basis. The option has not been granted, and it is probable that the Company will reopen the mine and take out the ore still remaining, as soon as the shipping season opens.

The American is one of the few properties in the iron districts operating a large force. The mine was closed for several months, during which time the shaft was repaired and other improvements made. The mine was reopened about a month ago, and with the recent increase in force it is believed that it will be operated to capacity in the coming season.

The report comes from Negaunee that the Hartford and Cambria, the two Negaunee mines of the Republic Iron & Steel Co., will soon reopen with a large force of men.

On the other Michigan iron ranges the mining industry

seems to be improving. Orders were received early last month to start work at the Indiana mine on the Menominee range. This property has been idle for years. It is controlled by the Thomas Furnace Co., of Milwaukee. The ore runs about 40% iron, and is low in phosphorus. The ore can be used in mixture with richer grades.

The Rogers-Brown Ore Co. has canceled its lease on the Iroquois mine at Mt. Iron, Mesabi range, and most of the machinery has been moved to one of the Company's properties on the Menominee range. The Iroquois was opened in 1913 and still has considerable ore in sight.

The working force at the Bristol mine, Crystal Falls, has been increased by 250 men.——One hundred men have been put to work at the Dunn mine, to work orebodies found last year after the mine had been reported to be about exhausted. ——Seventy men have been added at the Tully mine.——Work has been resumed at the Rogers-Brown company's mines in the Iron River district.——The Hollister Mining Co. has closed down its Ravenna mine at Crystal Falls. Pumping is being continued, so it is hoped that mining will be resumed in the near future.

On the Gogebic range, hoisting of ore was resumed at the Ashland mine on March 1. During the several months of suspension extensive repairs were made to the shafts.——All of the employees of the Newport mine are now working on full time schedule.——The Oliver Iron Mining Co.'s Ironwood mines are still working only three days per week.——In the Bessemer district, the Newport Mining Co. has increased its force at the Anvil mine and returned to full time.

NEW YORK

THE SMALL INVESTOR AND LOW-PRICE SHARES.—COPPER.—CALUMET & HECLA AFFAIRS.

One of the significant movements in the investment market during recent years has been that looking toward the making of low-price shares. It has long been the custom to issue shares in prospects, pure and simple, on a 'penny' basis. Outside of this field, however, it has been almost a universal practice, until recently, to make trading units as large as possible and at the same time secure distribution of the stock. This is a tendency that is now being overcome rapidly. It is coming to be recognized that the small investor, in the aggregate, is the most powerful of financial influences, the most capacious absorbent, and the most retentive. We are coming to the English idea of the £1 share. The unwieldy character of shares selling at a great premium is instanced by the Ahmeek, which has 50,000 shares, now quoted around $260. On the basis of New York Stock Exchange quotations as ordinarily given, $100 worth of Ahmeek par value would be quoted at $1040. Thomas L. Chadbourne, who is the largest individual holder of Ahmeek, has just mailed a letter to the shareholders, suggesting the issuance of four shares of stock for one now held, in order to make the issue more liquid in trading, and in handling the bank loans required by traders and brokerage houses. At the present market figures, Ahmeek has a valuation of about $13,000,000. The property is the feature among the Lake coppers, and only needs a move like that suggested by Mr. Chadbourne to make it the market leader of the Boston coppers. It may be doubted if it would not be wiser to make the face value of the stock still lower. The mining successes which have been market successes in New York have been put down within reach of the small investor, and the opportunity has been appreciated. London and Paris have long recognized the quality of buying which comes from the little man. He will speculate, from an investor's point of view, and ordinarily his purchases 'stay put.' Some of the best students of economic conditions are emphatic in their opinion that, just as fast as the country can work to it, we are preparing for a period of constructive enterprise and expansion. Such a move is more than due. Whether it is to come in the near future or not, it is quite certain that the financial interests that take the little investor into consideration, and break away from some of the old outworn traditions of Wall Street, will greatly profit thereby.

It may or may not herald any protracted period of great activity, but it is gratifying to note the continual general improvement in the copper situation. There are so many hazards impending that it is quite impossible to look forward with tranquil assurance, but the general inclination seems to be to claim a strong position for the copper industry, and to praise highly the manner in which the metal market has been handled during a most trying time. The Lake country is particularly active, and seems to be somewhat ahead of the producers farther west in getting back to normal production. The Michigan mines are back on full time, and February showed a marked increase over January, notwithstanding its being a short month. The increase in production was due in part to larger tonnage and in part to richer 'rock.' The refined copper production for the month is estimated as 19,180,000 lb. The over-sea shipping situation is one of the most important factors in copperdom right now. Copper prices are just a trifle easier, due to the fact that little metal can be sent out at present.

The work of undoing the Calumet & Hecla consolidation, which did not go through, is still going on. The Osceola Consolidated held its annual meeting this week, when the Calumet & Hecla representation on the Osceola board was reduced by two. One of the new directors chosen is J. M. Longyear, of Marquette, Michigan. Mr. Longyear, in connection with Charles F. Ayer, of Boston, has long been one of the largest factors in the mining industry in the northern peninsula of Michigan, both in iron and copper, and next to Calumet & Hecla they are the largest owners of the White Pine, which is expected to prove the next important addition to the list of Lake producers. The same interests also operate in Sweden, where they are large producers of iron ore.

WASHINGTON, D. C.

ONLY ONE MINING BILL MADE LAW IN THE LAST CONGRESS.—FATE OF MINING LAW AND FERRIS BILLS.—LACK OF INTEREST BY MINING MEN, AND OPPOSITION.

Despite the large mining program of the late Sixty-third Congress, only one measure became law, the Foster (chairman of the House Committee on Mines and Mining) bill providing for mine safety stations and experiment stations. This bill had passed in both Houses, and was rescued from the congestion after amendment in the Senate, in which the House later concurred. The bill as amended in the Senate provides for seven mine safety stations, in addition to those already provided for, instead of 15 as proposed in the House bill. The bill as it reads as signed by the President is as follows:

"*Be it enacted, etc.*, That the Secretary of the Interior is hereby authorized and directed to establish and maintain in the several important mining regions of the United States and the Territory of Alaska, as Congress may appropriate for the necessary employees and other expenses, under the Bureau of Mines and in accordance with the provisions of the act establishing said Bureau, 10 mining experiment stations and 7 mine safety stations, movable or stationary, in addition to those already established, the province and duty of which shall be to make investigations and disseminate information with a view to improving conditions in the mining, quarrying, metallurgical, and other mineral industries, safeguarding life among employees, preventing unnecessary waste of resources, and otherwise contributing to the advancement of these industries; *Provided*, That not more than three mining experiment stations and mine safety stations hereinabove authorized shall be established in any one fiscal year under

the appropriations made therefor. That the Secretary of the Interior is hereby authorized to accept lands, buildings, or other contributions from the several states offering to cooperate in carrying out the purposes of this act."

It will be noticed that the bill carries no appropriation to make it effective. The mine safety stations would have cost $10,000 each. The appropriations were purposely omitted, or the measure would not have passed. It will take a year to get the money, so that the act so necessary to the health of the miners will not be available for a whole year at least, probably not before July 1, 1916.

The bill creating a commission to codify the mining laws of the land died on the calendar of the House. Such a bill had already passed the Senate. In the last days, to pass the House, unanimous consent was required to pass the bill, and this could not be obtained, so this enterprise fell through after it had seemed last year that the measure would surely go through. It contemplated an expenditure of $25,000, and its enactment was much sought by mining engineers.

Another measure which failed to pass was the Ferris bill to authorize exploration for and disposition of coal, gas, phosphate, or sodium, and the famous leasing properties. This had passed both houses of Congress, but in the Senate the important parts of the measure were dropped, especially the leasing sections, so that the bill as shorn of its essentials became merely a bill for the relief of the oil and gas men.

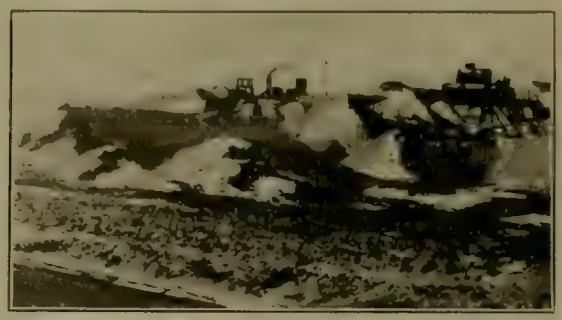
The mining members of Congress take some pride in having increased the appropriations this year from $25,000 to $35,000 for the tests in gas and oil in consequence of which important discoveries were made last year, as announced by the Bureau of Mines. The Bureau has also been permitted to continue the enjoyment of the appropriation of $100,000 for experiments in metallurgical mining.

All these make small crumbs to be thankful for. That more has not been done is the fault of the mining world itself. It is acknowledged as being lacking in unity on any matter that may be broached for enactment by Congress. No matter how simple the proposition, surprising opposition seems to develop quickly among the mining people, and nothing results, for Congress is loath to embark on legislation about which it understands but little and with regard to which opposition develops. A notable instance is the simple proposal to create a commission to codify the mining laws.

LEADVILLE, COLORADO

EXTENSIVE SHOOT OF ZINC CARBONATE ORE OPENED IN THE WOLFTONE MINE.—TWIN LAKES DISTRICT.

The most important discovery of ore that has been made in the Leadville district for a number of years recently occurred in the Wolftone mine of the Western Mining Co. A body of carbonate of zinc, whose exact dimensions are as yet unknown, has been opened in the upper levels of this famous property. Those in charge of the mine state that from the appearance of the shoot at the present time it will prove to be larger than the immense deposits that were mined in the lower workings. The ore that has been opened so far has been thoroughly sampled and averages about 25% zinc. The discovery of the carbonate came about in a rather accidental manner. A contract had been given for the driving of a 450-ft. cross-cut on the first level of the Wolftone property, to make an air connection with the Castle View shaft. This work had been under way only a short time when the drift cut the ore. Since that time the breast has been pushed steadily ahead for a distance of 70 ft. in the carbonate. At this point an old winze was found which led to another system of old drifts that were driven when the property was a producer of lead and silver ores. The winze has been retimbered, and a part of the old drifts has been cleaned out. All of these old workings are in the carbonate, and have opened for mining one of the largest orebodies that has been found in this district. The general manager of the Western Mining Co., S. D. Nicholson, has thoroughly examined the new orebody and has made arrangements for hiring all the additional men that can be used in stoping the ore. The Company has a long-term contract with one of the largest zinc buying concerns which allows shipment of all ore that will assay over 20%. With high spelter prices, the ore will be put on the market as rapidly as possible. The Wolftone is now producing nearly 500 tons of ore per day, and when the increase in tonnage comes with the working of the new orebody, the property will go on record as the largest producer in the state.



WOLFTONE MINE, CARBONATE HILL, LEADVILLE.

The Twin Lakes district will be the scene of the erection of a number of concentrating plants during the coming summer. Several new mines have been opened in that region, but the long haul necessary to get the ore out makes concentration indispensable. The larger mines are steadily getting out gold ore, which keeps up to $100 per ton, and the ground promises to be of great importance. A new company including mining engineers from Wales has been incorporated to operate in the Lackawanna and upper Twin Lakes section this coming summer, a fact that has added no little interest in that territory.

ROCHESTER, NEVADA

RICH GOLD ORE OPENED IN LINCOLN HILL CLAIM.—THE NEW MILL.—GOLD NEAR NENZEL HILL.—PACKARD COMPANY'S OUTPUT.

The recent development in the Blowback claim proves to be a genuine find of high-grade gold ore. The owners have driven 15 ft. along the quartz, and are now taking down the ore stripped, and will have about eight tons that is estimated to be worth $2000 per ton. This shoot is in the lower adit of the Lincoln Hill Co.'s mine, at a depth of 120 ft. below the upper workings, and about 160 ft. below the outcrop of the vein. There is 16 to 18 in. of this ore. On the upper level they are extracting ore valued at $300 per ton, and have followed it for about 150 ft. along the vein. In the upper workings there are three veins from which ore is being mined, but so far they have only investigated the one vein in the lower adit. This Company has produced about $40,000 in its two-stamp mill in Rochester cañon since November, mostly from its own mine. Several lots of ore from other mines on Lincoln and Wilson hills have been crushed.

This rich discovery has resulted in a great deal of interest in the Lincoln Hill area, and several claims have been bonded, and new leases have been taken on other claims.——The Forvilly lease on the Raven claim has been sold to L. J. Kaiser and H. L. Gleason. At a depth of eight feet they have one foot of $42 ore, which is good shipping ore in this district. ——The Grindley lease on the Gothem claim is sacking $200

ore.——H. L. Potter is sacking ore from his adit on the Nonpareil.——W. B. Borland, on Nonpareil No. 1, is almost to the vein with the cross-cut from the bottom of a 45-ft. winze. ——U. W. Harwood is making another attempt to locate the vein from which the rich float comes that he finds all over the Casey Jones claim.

California people are here examining the Buck & Charley mine, and have an option on the control of the stock. This mine has a good record as a shipper, and is in fine condition. ——The shoot on the Flunkey claim is being opened in the winze, and at eight feet depth shows nearly three feet of good ore.

The last of the three transformers for the sub-station was brought on February 26 on the Nevada Short Line, and was in place that night. As everything is ready for them, the mill should be ready to run next week. The tramway from the tunnel to the ore-bins on Nenzel hill is being constructed as fast as the snow will permit.

The Cole and Kallaher leases have a large amount of milling ore blocked out, and a road has been built from their adits to the head of the tramway for sending the ore to the mill when their turn comes. There is enough ore in the five leases on Nenzel hill to keep the mill supplied for over two years, besides considerable ore in many smaller properties.

A new discovery of gold has been made about four miles southeast of Nenzel hill, which seems quite promising, and a number of prospectors have gone over there.——On Fisher cañon, which is about eight miles south of American cañon, several locations have been made by Hildebrand, Logan, Alston, and Bailey. Some good specimens of free gold ore have come from their ground.——On Troy cañon, the next north, Bishop, Farthing, Odin, and Chambers have locations. They have given a bond and lease of the Prosperity No. 2 claim to A. E. Ferguson and Fred A. Long, who have started an adit to cut the vein at a depth of about 50 ft. On the surface this vein showed some heavy pannings of gold from the decomposed vein matter.

The last report of the Packard company shows that over $103,000 has been shipped from the Company's workings and those of the Kromer-Hampton lease, the ore assaying from $60 to $80 per ton.

The Nevada Short Line expects in another week to have the road extended into the town from the mill, and to be building its permanent station and freight depot. The new mill is now at work. About 100,000 tons of ore is ready in the mines for treatment.

LORDSBURG, NEW MEXICO

DISTRICT OUTPUT.—ORE HAULAGE.—EIGHTY-FIVE, BRUNO MOUNTAIN, AND EMPIRE ZINC COMPANIES' WORK.—POTASH DEPOSITS.—MISCELLANEOUS NOTES.

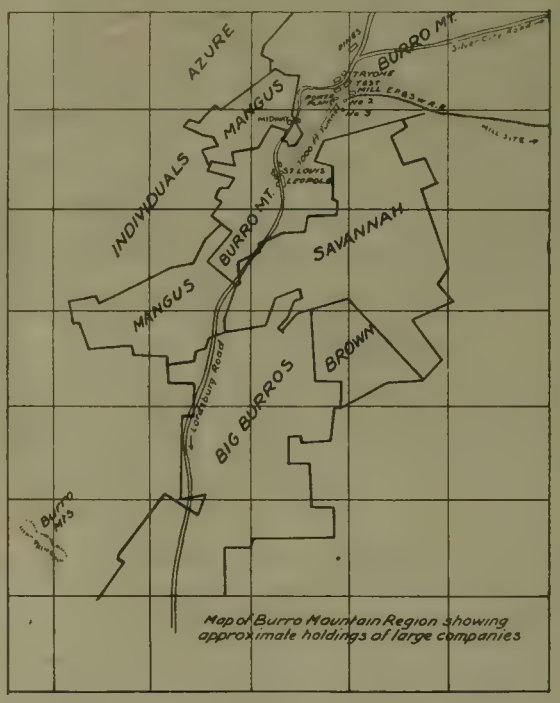
The output of the Lordsburg district in February was 143 carloads of highly silicious ore.

A caterpillar tractor has been shipped from the Holt Manufacturing Co., Stockton, California, to be used in hauling ore between Lordsburg and the mines, three miles southwest. The tractor is the first of its kind to be used here, and its success is looked forward to by those interested in ore transport. The project is headed by J. B. Downey and Mr. Rowan, of the Arizona Copper Co. of Clifton. If the tractor works well here as it does in other parts of America, it will be used on other roads. Six steel trailers have been shipped with the 'cat,' and all the ore freighting contracts of J. Olney with the mining companies, have been subleased.

The Eighty-Five Mining Co. has ordered an 82-hp. Ottumwa electric hoist, which will be installed in the main adit level and replace the old gasoline hoist. The new one will have a double drum 40 in. wide, with a capacity for 800 ft. It will also be equipped with Wuest herring-bone gears. The Company has also purchased five new machine drills and is preparing for an increased output.——The Octo Mining Co., has built a new brick foundation at its new shaft, for boilers, engine, and compressor.

At Tyrone, in the Burro mountains, the Burro Mountain Copper Co. has staked out its new townsite, and a road is being graded up the mountain side to the El Paso & Southwestern station. The new townsite is about a half mile above the Pines. It is understood the Company store and offices will be located there. Work is progressing rapidly at the Tyrone millsite.

At Hanover, the Empire Zinc Co. has completed construction of its tramway from the Thunderbolt claims to the site of the proposed new mill west of Hanover gulch. A two-compartment shaft is being sunk on the Thunderbolt sulphide zinc property. The Pinos Altos-Silver City narrow-gage tramway of the Empire Zinc Co. is nearing completion, but work has been delayed on account of bad weather. The tramway will be used for hauling ore with mules from the Cleveland



Map of Burro Mountain Region showing approximate holdings of large companies

mine to the railroad. The Company has not as yet commenced the erection of its Pinos Altos mill.

The nitrate and potash deposits near Rodeo are open for entry, according to advice received from the U. S. Geological Survey. Many claims are being staked and experimental work is being done in the East on the material found.

The Calumet mill in the Black range of Sierra county, was destroyed by fire last week. The plant was new, and it is reported that insurance papers had not been signed up to the time of the fire. The Company has been employing from 50 to 75 men.——J. C. Combs and associates, operating the Sherman group at Hillsboro, Sierra county, have opened high-grade gold ore in No. 1 adit. It is reported that a compressor and drills will be installed.——The Grand Central mine has been taken over under lease and bond from Oliver Wilson by the Owen Bros. of Santa Rita.——The Wicks mine at Kingston has been bonded to Hirch and Salem, who plan to mill the ore.——At Lake Arthur, oil drilling has been resumed by the Pecos Valley Petroleum Company.

THE MINING SUMMARY

The news of the week as told by our special correspondents and selected by the local press.

ALASKA

JUNEAU

On March 5 the federal mine inspector, Sumner S. Smith, instructed a class of 20 men at Treadwell in the use of Draeger and other rescue apparatus. A new fire-alarm system is being installed.

ARIZONA

GILA COUNTY

The Old Dominion produced 2,074,000 lb. of copper in February, compared with 1,745,000 lb. in January and 3,066,000 lb. in February of 1914.

A report issued by the Miami Copper Co. shows that ore reserves consist of 37,000,000 tons of 1.85% sulphide ore and 6,000,000 tons of 2% mixed sulphide and oxide ore. Alterations to the mill will result in the six units treating 700 tons per day each by the middle of the current year. The output in 1914 was 33,000,000 lb. of copper, at a cost of 9.333c. per pound. Three dividends of 50c. per share were paid amounting to $1,120,375. Concentrate is being shipped to the new smelter of the International company at Miami. At the east end of the mine the ore is cut off by a fault, the result of the overlying Gila conglomerate slipping down, but geologists believe that the orebody will extend east of this fault.

GREENLEE COUNTY

At the Shannon mine the concentrator, smelter, and converters are in full blast.

MOHAVE COUNTY

(Special Correspondence.)—One of the most important mining deals in the history of the Tom Reed-Gold Road district, with a bearing on its future development, was closed on March 4, when A. L. White, of Lima, Ohio, and D. S. Richards, of Kingman, Arizona, sold the Victor and Virgin mines to the Orion Mining & Milling Co., represented by William H. Wise, C. J. Rhodes, G. E. Burnell, and others of Los Angeles, and J. L. Humble, a prominent Montana banker. The transaction covers 40 acres of patented ground one mile south of the Tom Reed mine, and represents an expenditure of over $500,000, including the sum spent by former owners for underground development and surface equipment. This is the third transaction of importance which has been closed in this district during the past 30 days, the other two being the $67,500 Big Jim claims, negotiated by S. M. Warmbath, of Los Angeles, and the $87,500 deal of J. H. Hoffman, of the Arizona Southwestern Copper Co. with the Tom Reed Jr. Mining Co. For several weeks past the Victor-Virgin deal has been in course of negotiation, and was closed after an inspection of the property by the new owners and their engineers, namely, F. F. Brush, electrical engineer, of Los Angeles, who passed on the surface equipment, and Richard Lloyd, a mining engineer of that city, who reported on the mine. The latter will remain at the mine for several days for the purpose of making a thorough inspection of the Victor, Virgin, and adjoining claims owned by the Orion company, and his report will form the basis for the future development of the holdings, which aggregate 120 acres. The new owners are authority for the statement that operations will at once be resumed, and that they will be on an extensive scale. There is no property in the district better equipped for large development, as the surface plant is modern. It includes an electric power-plant at Needles, California, 11 miles of 4-in. pipe extending from the Colorado river to the mine, together with a 10-stamp mill, cyanide plant, tube-mill, hoisting, and other machinery. The property has approximately 2500 ft. of underground workings, and in the past has produced a considerable tonnage of ore. The north end of the ground, however, has never been prospected to any extent, despite the fact that all of the orebodies trend in that direction. The recent development in the United Eastern having proved the advisability of cross-cutting at depth, the present owners will have the territory just purchased thoroughly explored. On the Company's Oversight claim, adjoining the Victor on the north, a good body of ore is exposed, and is to be opened at depth by means of a drift which will cut three parallel veins before reaching its objective.

Oatman, March 4.

YAVAPAI COUNTY

Rich copper ore has been cut at 1400 ft. in the United Verde Extension mine. At 1200 ft. the drift has been driven 40 ft. in ore to 7 to 8 ft. wide, a shipment from which averaged 37% copper.

CALIFORNIA

AMADOR COUNTY

The Plymouth Consolidated company reports as follows for February:

Ore milled, tons	9,300
Value of output	$48,731
Working expenses	19,890
Development charge	7,537
Surplus over above	21,304

The mill worked only 26 days on account of power being off.

Instead of sending injured employees to Sacramento or elsewhere, the Plymouth Consolidated will now be able to treat them in its own hospital at the mine.

BUTTE COUNTY

(Special Correspondence.)—In the case of the Success mine, mentioned in the *Press* of March 6, the facts are not quite as stated. They are as follows: During the third week in February a stranger from a town in Missouri came to Oroville and started to buy the whole of Butte county, including all its mines. He went to the Success drift-gravel mine, owned by G. W. Rumble, and wanted to see it, which he was allowed to do. After a week he again wanted to see it with his mining engineer, and did so. The next week he asked again to see it with another engineer, and, as the miners were timbering, the request was refused. That night, with three men and an automobile, he robbed the mine, taking away nine sacks of high-grade material, but was caught as he drove into Oroville with it. Both the Missouri man and his friend were arrested, being caught in a barn, but the nine sacks had been seized and removed. There was, however, one small sackful overlooked, which weighed 11 lb., which was panned and yielded about 10c., equal to about $12 per cubic yard of gravel. For spite the stranger had the owner of the mine arrested, and later fled from the district.

South Berkeley, March 8.

At Oroville the suit of William C. Pershbacker *v.* the P. B. Steifer Mining Co. for $50,000 damages, is being heard. The plaintiff alleges that the defendants broke a contract with him when he was engaged to examine the Company's gravel mine. The above suit suddenly stopped on March 10

when plaintiff's attorneys asked that it be dismissed without prejudice, the plaintiff agreeing to pay all costs.

CALAVERAS COUNTY

The new 6-cu. ft. dredge of the Oro Water, Light & Power Co. has been started on the Mokelumne river. Unfavorable weather hindered construction to some extent. Ben Fowler is dredgemaster.

NEVADA COUNTY

Less than half an acre of ground in the centre of the mineralized area of the North Star Mines Co. had not been located by that Company, and R. Jones, of Grass Valley, recently staked it.——The old Pennsylvania Consolidated Mining Co., whose property was acquired in 1912 by people connected with the Empire company, is to distribute $3 per share, about $150,000. This is part of the payment of $500,000 for the mine.

According to Elmer Banning, of the You Bet Mining Co., an attempt was made to rob the mine two weeks ago, but the reported loss of $2000 was not true, as the thieves had insufficient water for washing the gravel.

SAN BERNARDINO COUNTY

The Oro Belle gold mine, at Hart, has been taken on option by the Tonopah Belmont Development Co. of Nevada. Considerable work has already been done, and if the Company is satisfied at the end of a year a plant of not less than 50-ton capacity is to be erected.

SHASTA COUNTY

Of the greatest importance to this county's copper smelters was the decision of Judge Van Fleet, last week, that the Mammoth Copper Co.'s plant at Kennett was doing no damage to agricultural lands, as alleged by the farmers of the district. The plaintiffs were left to pay costs of the case. The Company has resumed work, after about six months' shutdown, on the Spread Eagle, Stowell, Sutro, and Friday-Lowden mines.——Prospecting with a Keystone drill has been started on the Indiana Gold Dredging Co.'s option in Happy Valley along Dry creek. Shafts also will be sunk in the gravel. O. C. Perry, of Oroville, is in charge.

TRINITY COUNTY

The Golden Jubilee mine, near Carrville, has been reopened by San Francisco people after several years' shut-down. Equipment includes a hoist and 10-stamp mill. C. L. Probestel is manager.——It is reported that work is to be started again at the Headlight mine, one of the largest lode properties in the county.——A $108 nugget was found on the Pickett mine, near Junction City, last week.

COLORADO

GILPIN COUNTY

It is probable that the Fifty Gold Mines Corporation property at Black Hawk, now in the hands of the referee in bankruptcy, will soon pass into the hands of a new company.——The Pittsburg mine, in lower Russell gulch, continues to ship ore returning up to 7.20 oz. gold, 57 oz. silver, and 17.80% copper.——Some rich gold ore is being extracted from the Gilpin-Orion mine on Bobtail hill.

LAKE COUNTY (LEADVILLE)

Ore output of the district in February was a trifle over 2200 tons per day. The Arkansas Valley smelter blew in another furnace, making five in blast.

The Western Zinc Mining & Reducing Co.'s zinc oxide plant, which is described by E. H. Leslie in this issue of the *Press*, has been acquired by the Western Zinc Oxide Co., composed of Leadville men. A. B. Augustine, who was in charge during construction, is to be manager. It is stated that the oxide which was made as a by-product for paint manufacture, will be put on the market as a concentrated zinc ore. The oxide assays 75% metal. The plant will resume as soon as possible.

To dredge placer ground near Malta, Colorado Springs capital has organized the Derry Mining & Land Co., with a capital of $100,000. Tested areas return 25c. per yard.

OURAY COUNTY

The Wanakah smelter at Ouray is treating 300 tons of ore per day.——The Forester zinc concentrator has a capacity of 100 tons, and is producing a high-grade product.

TELLER COUNTY

At a meeting of the El Paso Consolidated at Colorado Springs last week, Harvey McGarry, vice-president of the Golden Cycle company, was elected president of the El Paso company.——Considerable development is under way in the Gold Hill properties of this district.——Now that the El Paso mine has been equipped with new plant in place of that burned last year, work is to be resumed in the extension of the Roosevelt drainage tunnel, the face of which is approaching the Elkton mine

IDAHO

IDAHO COUNTY

In listing the Idaho Placer Mines Co. on the Spokane Stock Exchange, the following information was given out: The 1000 acres of land is between Newsome and Baldy creeks in the Bitter Root forest reserve. The estimated quantity of gravel is 100,000,000 cu. yd. There is 5000 miner's inches of water available for 70 to 100 days in the spring, with a maximum and minimum of 7000 and 700 in. Actual sluicing has yielded 20c. per yard. It is proposed by the general manager, R. H. Bailey, to drive a tunnel the full length of the deposit, near bedrock, and the earth from the full face of the deposit is to be worked into the flume, where a sufficient flow of water is to be maintained to extract the gold, and a head for the giants to cave the face of the deposit is to be provided by a large capacity pump, to be operated by a Pelton wheel.

SHOSHONE COUNTY (COEUR D'ALENE)

The manager of the Hunter mine at Mullan, T. M. Brennan, has secured a five years' bond on the Idaho Giant mine, near Mullan, for $100,000, according to terms ratified by the stockholders of the Idaho Giant in a meeting held at Spokane. The bond specifies that operations are to be started on April 1.——High-grade silver ore has been opened at 800 ft. in the Samson company's property on East Eagle creek, near Wardner. The drift on this level is in 140 ft., showing 18 to 30 in. of ore.——The stockholders of the Tamarack & Custer Consolidated Mining Co., of Wallace, recently received a financial statement of the present condition of the Company, showing the following: liabilities, capital, $2,000,000; accounts payable, $23,916; profit and loss, $244,752; total, $2,268,668. Assets, property, $1,755,160; unissued stock, $223,712; accounts receivable, Ohio Smelting & Refining Co., $66,810; cash, Wallace National Bank, $202,920; Exchange National Bank, Spokane, $65; total, $2,268,668.——The Ontario company has started another suit against the Stewart, alleging extraction of ore worth $25,000.

MICHIGAN

HOUGHTON COUNTY (THE COPPER COUNTRY)

In 1914 the Hancock Consolidated Mining Co. sold 488,678 lb. of copper, netting $65,427. Expenses totaled $214,971. The loan outstanding is $164,267. Operations were suspended in August. Development totaled 2300 ft., mainly driving on veins at No. 13, 18, 39, 44, 49, and 53 levels. Stoping was done on No. 14, 15, 16, and 18 levels on No. 3 lode; No. 13, 39, and 44 on No. 4; No. 49 and 53 on No. 8; and No. 13 and 18 on No. 9 lode.

The prospecting cross-cut on No. 32 level of the Franklin is advancing over 50 ft. per week with two drills. To the eastern boundary it will be over one mile long.

The report of the Cliff Mining Co. for 1914 shows that

$10,270 was spent on prospecting and development, against $16,448 in 1913. Rock cut by No 16 and 17 diamond-drill holes is badly shattered. In No 18 it is less disturbed. The hole reached the boundary at 638 ft., from where it was continued by the Tamarack company on its property to 1155

THE ISLE ROYALE MILL AFTER THE FIRE.

ft. Little copper was disclosed by this work. These holes complete the exploration planned from the Kearsarge amygdaloid to the eastern boundary.

The output of the Lake Superior copper mines is estimated as follows for February, an increase of about 15% over the previous month:

Mine.	'Rock,' tons.	Copper, pounds.
Copper Range Con., including Baltic, Trimountain, and Champion	144,000	3,600,000
Osceola Con., including North and South Kearsarge and Old Osceola	100,700	1,800,000
Ahmeek	59,000	1,500,000
Wolverine	30,000	600,000
Mohawk	62,000	1,200,000
Centennial	12,800	170,000
Allouez	33,500	600,000
Superior	16,000	320,000
Isle Royale	48,000	850,000
Mass Con.	23,000	460,000
Calumet & Hecla	227,000	6,000,000
Victoria	7,000	100,000
Winona	4,000	80,000
Quincy	95,000	1,800,000
Total	862,000	19,080,000

MISSOURI

Jasper County

Ore production of the Missouri-Kansas-Oklahoma district during the week ended March 7 was as follows, in pounds:

Class of ore.	Av. value per ton.	Week.	Ten weeks of 1915.
Blende	$67.53	5,602,740	91,194,230
Calamine	41.23	1,006,100	8,232,680
Lead	46.91	1,243,530	14,223,150

On a 15-acre lease on the Rex land, east of Joplin, C. W. Edwards and others have cut 13.5% zinc-lead ore at 103 to 120 ft. depth. A shaft is soon to be sunk to prove the drill records.

St. Francois County

Full-time operations were resumed at the four great lead mines in this county on March 16. Since October the capacity has been curtailed by 25 per cent.

MONTANA

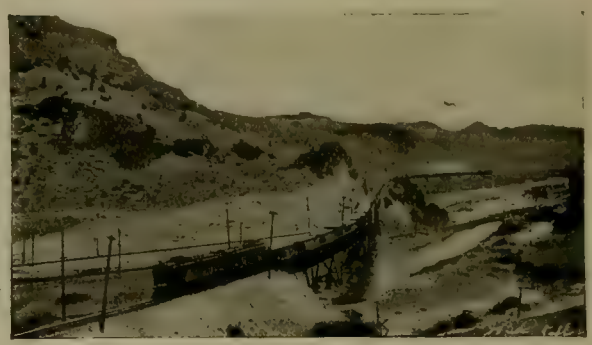
Madison County

The Galena mine, known as the Jackson, at Sterling, has been sold to F. S. Mitchell, of Butte, and H. F. Fulton, of Cleveland, Ohio. The new owners will erect a modern mill and cyanide plant. Lessees have extracted about $200,000 from the property.

Silverbow County

The report of the Tuolumne Copper Mining Co states that the ore mined during 1914 averaged 4.1%, producing 1,945,286 lb. copper, 115,355 oz. silver, and 150 oz. gold. The gross and net returns were $201,652 and $133,513 respectively. The shaft was sunk 206 ft., and a large station cut at 2600 ft. Indications at the bottom level are very favorable, and the vein should be thoroughly developed at this depth. The shaft will also be sunk another 200 ft. There is a decrease in the percentage of zinc at 2600 ft. Work was stopped on October 24 on account of the metal market.

The Pilot-Butte Mining Co.'s superintendent, Paul A. Gow, in his annual report stated that the Pilot shaft was sunk from 2090 to 2420 ft. It is proposed to sink 400 ft. deeper. Work on the south, middle, bornite, Gow, and glance veins is detailed.



ORE TRAIN ON BUTTE, ANACONDA & PACIFIC LINE HAULED BY GENERAL ELECTRIC LOCOMOTIVES.

The mine and smelter of the East Butte Copper Mining Co. is to resume work about the middle of April, according to a semi-official report in Butte on March 12. The plant is being overhauled.——The Anaconda has 14 of its main shafts in operation, eight being still shut down.——Some concentrate from the Butte & Superior is now being shipped to the Caney and Deering smelters in Kansas, and within 30 days the quantity sent there will be increased to 5000 tons per month.

NEVADA

Churchill County

After cross-cutting 1000 ft. on the 1300-ft. level, the ore-shoot in the Nevada Wonder mine has been cut, according to J. S. Austin, president of the Company. On the 1000-ft. level, two shoots totaling 500 ft. in length, were opened. The average production is $15 per ton. The mill is doing better work, as the superintendent, E. E. Carpenter, installed additional Dorr thickeners and zinc-boxes. During six days in February the plant treated 200 tons per day.

Nye County

The mines at Tonopah produced 10,586 tons of ore worth $216,508 during the second week of March.——In the Monarch Pittsburg mine the rise on the vein is up 16 ft. in good ore. The cross-cut is out 90 ft. with no foot-wall, but no ore in commercial quantities has been found yet. Several assays returned from $4 to $13.85 per ton.——At 700 ft. in the Jim

Butler a cross-cut has found the displaced portion of the vein, showing 24 to 30 in. of good ore.——Arguments in the Jim Butler-West End suit were concluded on March 11. Judge Averill expects to deliver his decision within a month of the time when the notes are transcribed.

White Pine County

Accidents at the Nevada Consolidated Copper Co.'s properties in February were as follows: Copper Flat, eight minor injuries; concentrator, nine, only one causing loss of time; and the smelter, seven non-disabling accidents.

NEW MEXICO

Socorro County

Residue from the mills at Mogollon flows into the Frisco river, which joins the Gila, and it is said that the material is becoming a nuisance to the land in the valley, so the canal companies are discussing a means of preventing the mining companies from continuing this practice.

UTAH

According to the March trade and finance letter of the National Copper Bank, the mines of the intermountain states, Utah, Idaho, and Nevada, have shown good increases in latter years, as follows:

	Utah.		Idaho.		Nevada.	
Metal.	1910.	1914.	1910.	1914.	1910.	1914.
Silver, ounces	10,445,900	11,752,000	7,027,000	13,000,000	12,366,000	15,200,000
Copper, pounds	125,185,455	155,901,000	6,877,515	5,500,000	64,494,640	60,561,000
Lead, pounds	114,162,000	181,553,000	199,848,000	345,000,000	4,390,000	13,794,000
Zinc, pounds	14,442,000	14,297,000	6,908,000	38,614,000	3,032,000	13,000,000
Gold, value	$4,312,700	$3,300,000	$1,035,000	$1,115,000	$18,873,700	$11,320,000
Total value	$31,655,049	$38,000,000	$14,870,288	$24,141,000	$34,099,007	$28,800,000

Minerals other than the above are produced to the extent of over $9,000,000 per year in Utah, and over $500,000 in Idaho and Nevada.

Juab County

In the south drift of the 1700-ft. level of the Eagle & Blue Bell mine, 30% lead and 30-oz. silver ore has been cut. This shoot is probably the downward extension of that worked at 1550 ft. In 1914 this property shipped 32,736 tons of lead, copper, and gold-silver ore valued at $513,236, of which $121,536 was net profit. The Bingham Mines Co., of Salt Lake county, received $104,250 in dividends from this Company.——About 1000 tons of lead-silver ore is ready for shipment from the May Day. Most of it is worth $50 per ton. Some zinc ore will be sent out from the Chief Consolidated claim, on which the May Day company has a lease.——Some lessees in the Gemini mine have started a suit for $25,000 against the Gemini Mining Co., alleging failure to pay the plaintiffs a certain percentage of the value of all ores mined in certain parts of the property.

Salt Lake County

The Utah-Apex mine produced 4082 tons of shipping and 9701 tons of milling ore in January. The latter yielded 3276 tons of concentrate. Out of $67,365 gross income, the net was $22,129. Costs were as follows: shipping ore, all charges, $2.70 per ton; milling ore, mining, and general, $2.86; and milling, 66.2c.; a total of $3.522 per ton. The average of all ore was $3.28 per ton.

The tunnel being driven by the Alta Tunnel & Transportation Co. has cut from 3 to 6 ft. of zinc ore, near a porphyry dike.

Summit County

The Silver King Coalition will distribute 15c. per share, amounting to $187,500, on April 1. Dividends total $13,395,500 to date.——The Silver King Consolidated will pay 10c. per share, or $62,000, on April 1, making a total of $619,000 to date.

WASHINGTON

Stevens County

Near Valley, the Vulcan Copper Co. is preparing the Admiral, Double Eagle, and Vulcan mines, in the Colville district, for an active season, when ore is to be shipped. Roads are being repaired for this.

CANADA

Alberta

No. 2 well of the Alberta Petroleum Consolidated Co., at Calgary, was down 2725 ft. in the Dakota sands on March 5. The formation is considered favorable.

British Columbia

As soon as the weather improves, the British Columbia Copper Co., at Princeton, will resume extensive development. The manager, Oscar Lachmund, is in New York attending the annual meeting of the Company. Probably the smelter at Greenwood will soon be blown in.——During the first week of March, Rossland mines shipped 8450 tons of ore to the Trail smelter. Production from the Le Roi company's Josie mine in February was 1082 tons of ore and 86 tons of concentrate. The revenue was $18,875, and expenditure $9375.

The Omineca district is described in this issue of the *Press*.

Ontario

The Nipissing report for February shows that the high-grade mill treated 165 tons of ore, and the low-grade plant 4696 tons, the yield being valued at $164,140. The refinery shipped 376,709 oz. silver. Development generally was satisfactory. At No. 73 shaft most of the work was from No. 4 level. One rise is up 101 ft., 30 ft. of which showed 3 in. of 2500-oz. ore. At No. 64 shaft driving was done on the 1000-ft. level, 53 ft. of the vein being opened, but results are not encouraging. Three men have been arrested in connection with the attempt to destroy the Nipissing powder magazine late in February. Over 8000 sticks of dynamite were found.

At the Hollinger, 20 of the 40 new stamps are crushing ore from the Acme mine. The rest of the stamps will be dropping at the end of March.

KOREA

The Oriental Consolidated company's output in February was valued at $125,100. Details of the December operations are as follows: ore treated, 28,682 tons; bullion from all plants, $148,216; extraction at the Taracol cyanide plant, 87 per cent.

According to a consular report, an Industrial Competitive Exhibition is to be held in Seoul from September 10 to October 31, 1915. Only articles produced, taken, refined, or manufactured in Chosen (Korea), or designed for use in this country will be accepted for exhibition.

The Seoul Mining Co., operating the Suan Concession in Whang Hai province, reports the following results for February:

Stamps working	40
Time, days	27
Ore crushed, tons	6,480
Total recovery	$62,100
Operating expenses	25,000
Net earnings	37,100

PERSONAL

W. H. Howard is at Los Angeles.

Stanly A. Easton is visiting San Francisco.

C. H. Benedict has returned to Lake Linden.

E. E. Olcott was in San Francisco last week.

Lewis Searing has been in Los Angeles and San Francisco.

R. J. Barber is now manager for the Banker mine, at Leadville.

Otto Ruhl is in charge of the Missouri state mineral display at the Exposition.

J. H. Price is in charge of the Nevada state mineral display at the Exposition.

Karl Eilers was in San Francisco during the week and is returning to New York.

Edward Schwerd is in charge of the Idaho state mineral display at the Exposition.

E. S. Bardwell is in charge of the Anaconda Copper Mining Co.'s exhibit at the Exposition.

T. C. Woodworth, consulting engineer for the Fortuna Mines Corporation, was at Boston recently.

Claude Ferguson has been appointed superintendent of the Jessie mine for the Chaparal Mining Co., at Chaparal, Arizona.

E. P. Mathewson has recovered nicely from an operation which he underwent in Montreal, and expects to go to New York about the end of the month.

D. H. Newland, who has been in San Francisco superintending the installation of the New York mining exhibit at the Exposition, has returned to Albany.

R. L. Agassiz and James MacNaughton, of the Calumet & Hecla, were guests of William E. Corey at a dinner given at Sherry's, in New York, one night this week.

Fred Brule, formerly superintendent of the surface department at Anaconda, has been appointed superintendent of the surface department at the Great Falls smelter.

Baylies C. Clark has been appointed temporary superintendent and secretary of the Bunker Hill Consolidated Mining Co., during the absence of Mr. Hampton, who is on leave on account of illness.

Dr. James Douglas was presented with a certificate of honorary membership in the American Mining Congress, which was voted to him at the Phoenix convention of the Congress, at an informal luncheon given at the Engineers' Club in New York on February 17.

Roy L. Oliver, formerly assistant engineer and mining captain at the Franklin mine, has been appointed superintendent of the Franklin mill, which will start operation on Franklin and Hancock ore on April 1. Mr. Oliver succeeds the late E. S. Warne.

Pierre de P. Ricketts and John H. Banks have dissolved partnership and will independently carry on business as metallurgical and chemical engineers. Mr. Ricketts will remain at 80 Maiden Lane, New York, and Mr. Banks has taken offices at 61 Broadway.

James F. Kemp, has been selected as the speaker at the Michigan College of Mines class-day exercises on April 15. Professor Kemp is at present making a geological examination in Montana, and on his return to the East, will stop at Houghton to deliver the class-day address.

H. G. Wright, formerly chief draftsman at the Anaconda works, has been appointed superintendent of construction, to take charge of the construction work that is to be done at the converter and reverberatory smelting plants. J. B. Johnson, formerly assistant chief draftsman, has been appointed to fill the vacancy caused by the promotion of Mr. Wright. S. Bishop has been appointed assistant chief draftsman to fill the vacancy caused by the promotion of Mr. Johnson.

OBITUARY

A. R. Parsons, one time in charge of the Desert mill of the Tonopah Mining Co., Nevada, died at Las Vegas in the first week of March.

John Gray, who died March 3 at Los Angeles, was the largest individual stockholder and the general manager of the Wasp No. 2 mine in the Black Hills, South Dakota. He was obliged to retire a year ago on account of bad health. He was born at Newcastle-on-Tyne, England, February 28, 1864, and came to Scranton, Pennsylvania, as a young man, where he followed coal mining for two years, later going to Rock Springs, Wyoming. He went, in 1876, to the gold rush in the Black Hills, where he stayed until the early eighties, when he went to the Coeur d'Alene district, where he remained for two years, returning to the Black Hills. With his wife, he conducted a miners' hotel at Terraville for fifteen years, meanwhile investing his savings in mines, and in the latter nineties made his fortunate investment in Wasp No. 2. He was buried at Deadwood, March 8, and is survived by three brothers and sisters in England.

William H. Cole, of Duluth, one of the foremost mining men of the Lake Superior region, passed away on March 9 at Pasadena, California. William H. Cole was born near Ontonagon, Michigan, 58 years ago. He became interested in diamond-drill work when a young man and did considerable exploration work on the Marquette iron range. In 1885 he went to Tower, on the Vermilion range in Minnesota, as superintendent of drilling for the old Minnesota Iron Co. In 1892 he resigned from the Company to go into business as an independent diamond-drill operator. In 1893 the Cole & McDonald Co. was organized, the name of the firm being changed ten years later to the Cole & McDonald Exploration Co. As president of these two companies, he was an authority on mining exploration work and was directly responsible for the opening of many of the mines which have made Minnesota famous as the greatest iron-producing district of the world. With O. D. Kinney he started the Kinney mine, now operated by the Republic Iron & Steel Co. Mr. Cole was interested in the Whiteside, Agnew, Buffalo & Susquehanna, and other mines on the Mesabi range. The company of which he was president has been credited with the opening of most of the largest iron producers on the Mesabi range.

James Geikie, younger brother of Sir Archibald Geikie, and son of the late James S. Geikie, died at his home in Edinburgh on March 2. He was born in 1839 at Edinburgh, and after passing through the High School and University there, followed the tradition of the family by engaging in geological work and was soon district surveyor on the Geological Survey of Scotland, of which his older brother was then director. In 1882 he succeeded his brother as Murchison Professor of Geology and Mineralogy at the University of Edinburgh, eventually becoming also Dean of the Faculty of Science. His attention was directed largely toward glacial geology and his best known book is 'The Great Ice Age,' written in 1874, though he published many others on physiography and general geology. Many honors came to him in the course of a busy life, such as the Brisbane medal of the Royal Society of Edinburgh, the Murchison Medal of the Geological Society of London, and the Gold Medal of the Royal Scottish Geological Society. He was also honorary editor of the *Scottish Geological Magazine*, past president of the Royal Scottish Geological Society, fellow of the Geological Society, and fellow of the Royal Society of Edinburgh. A distinguished member of a distinguished family, his loss will be keenly felt throughout the geological profession.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, March 18.

Antimony	25 —25¾
Electrolytic copper	15½ 15¾
Pig lead	4.30—5.30
Quicksilver (flask)	$80.00
Spelter	10¾—11
Tin	40 —41½
Zinc-dust, 100-kg. zinc-lined cases	15

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, March 18.—Copper is strong, lead is strong and advancing and spelter is weak.

COPPER

Prices of electrolytic in New York, in cents per pound.

The spelter market continues to display strong movements. In London it is £44 10s. per ton.

Zinc ore shipments from Joplin during the first week of March amounted only to 2800 tons, the smallest in years. Buyers were dealing light, 50% of the usual amount. During the second week prices were $1 to $3 weaker, the lowest basis, 60% ore, being $65 per ton for carloads. It is reported by the attorney general, John T. Barker, that suit has been filed against certain smelters, alleging that they are members of a trust. An investigation was made at Joplin by the assistant attorney, W. T. Rutherford.

The Butte & Superior output in February was as follows: ore treated, 39,310 tons; recovery, 91.1%; assay of concentrate, 52.64%; and zinc in concentrate, 12,295,000 pounds. The American Zinc, Lead & Smelting Co. is to treat 4500 tons of concentrate per month for the Butte & Superior.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending

The tone of the silver market has been steady, and Samuel Montagu & Co. of London states that the main reason for this feature is the scanty selling from the United States and the interruption of supplies from Mexico.——The first forecast of the wheat crop of the Punjab district of India states that the season was exceptionally favorable.——It is thought by many bankers that the plan for a new coinage in Cuba will provide an increased market for silver. It is estimated that the amount of silver coins already contracted for will require 4,000,000 oz. of bar silver, and a greater amount would be needed should Cuba decide that more silver coins of Cuban denomination are needed to replace those of various nations now in circulation.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Feb. 18	62.50	Mch. 3	70.00
" 24	62.50	" 10	80.00
		" 17	80.00

Monthly averages.

June	30.72	....	Dec.	33.60	....

Tin is strong at 51.50 to 54c. In London it is quoted at £190 per ton for spot metal.

COMPANY REPORTS

TONGKAH HARBOUR TIN COMPANY

This is an Australian company operating dredges in Siam, and the report is for the year ended September 30, 1914. The boats handled 2,199,408 cu. yd., yielding 1126 tons of black tin, against 3,336,180 cu. yd. for 1329 tons in the previous period. The average yield was 1.147 lb. per yard, equal to 23c. per yard. The net value of the tin was $490,000, and profit $168,000. Four dividends were paid totaling $1.68 per share, and including previous balances a credit of $250,000 remained. Owing to the price of tin, the past year's profit was $221,000 less than that for 1913. Every dredge required considerable repair, No. 2 and 3 being idle for three months. Costs totaled 13.05c. per yard. The output to date is 6241 tons of black tin sold for $3,080,000, and dividends paid $1,080,000.

ASSOCIATED NORTHERN BLOCKS (W. A.), LTD.

This English company owns the Iron Duke lease at Kalgoorlie, and the Victorious leases at Ora Banda, Western Australia, and El Refugio in Mexico. On the last, nothing was done during the year ended September 30, 1914, owing to the disturbed state of the republic. The Iron Duke property was mainly worked by tributers, and old residue was re-treated; while at Ora Banda a sulphide mill was erected, the oxide mill working only four months. Development in the Ora Banda mine, according to the general manager, G. M. Roberts, amounted to 4425 ft., at a cost of £14,715. From the character of the orebody it is difficult to estimate reserves, but there is certainly several months' ore in sight for the new plant. Capital expenditure on this property was £35,282.

At the Iron Duke, tributers mined 7891 tons of ore, paying royalty of £3462; and 68,205 tons residue yielded £12,285. The Victorious oxide mill treated 26,402 tons for £28,390. The revenue from all sources was £69,099, of which £9246 was profit. Investments are valued at £37,210, besides which are stores and other assets of good value. Costs in all departments were high, owing to the irregular operations.

WASP No. 2 MINING COMPANY

According to the annual report of this Company, operating at Flatiron, South Dakota, there was treated during 1914 176,140 tons of ore having an average value of $2.015 gold and 28.7c. silver per ton. There was saved 73.31% of the gold and 34.77% of the silver, a total of $1.533 per ton. Costs totaled $226,683, or $1.287 per ton. Profits for the year, including small revenues from sales of coal, mail contract, and rents, totaled $45,465, of which $30,000 was paid in dividends. In addition to the expenditures as given above in calculating the costs, other items called for disbursements as follows: dividends, $30,000; real estate, $1850; mine buildings, $57.18; mill buildings, $221; buildings, $915; mine machinery, $5014; mill machinery, $925.30; horses, wagons, and harness, $125; and bills payable, $6000. A profit was made on mail contract, $62; coal sales, $450; and rents, $1658; a total of $2169. At the end of the year the Company had a cash balance on hand of $6035. D. A. McPherson, cashier of the First National Bank of Deadwood, is president and treasurer, and Edward Manion, Lead, general manager.

Mining in open-cuts, using a steam shovel for stripping as much as 20 ft. of overburden to obtain 20 ft. of ore, cost 66.1c. per ton, and milling, which consists of crushing the hard quartzite to pass a screen having openings 0.25 by 0.75 inch, followed by simple leaching with cyanide, cost 59.1c. per ton.

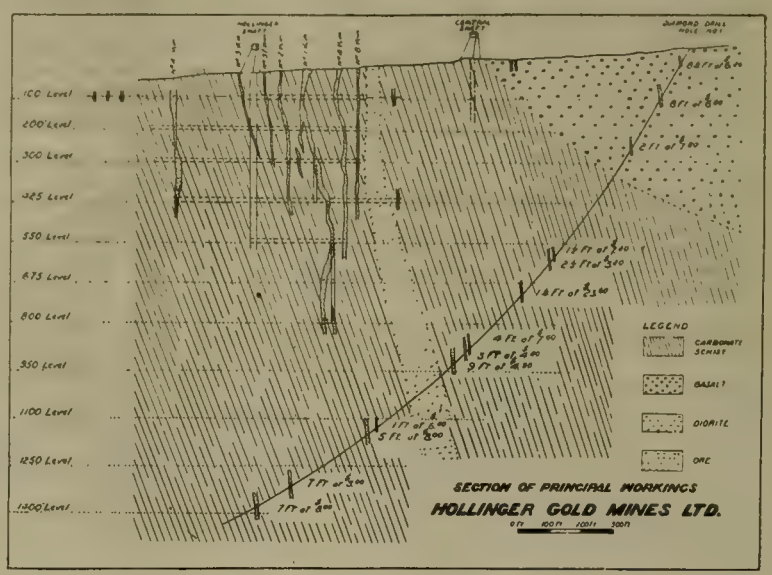
Early in 1910 the Company suffered the loss by fire of its first mill. It was immediately replaced by the present plant, which has a capacity of 15,000 tons per month, and which began operations in December 1910. The Company's records show the following accomplished since that date:

Year.	Tonnage.	Yield.	Value per ton.	Dividends.
1911	160,860	$ 286,160	$1.779	$ 60,000
1912	158,840	308,175	1.940	85,000
1913	127,680	219,333	1.718	55,000
1914	176,140	269,979	1.533	30,000
Total	623,520	$1,083,647	$1.738*	$230,000

*Average.

HOLLINGER GOLD MINES, LTD.

This is the largest gold producer in Canada, and the report



is for the year 1914. It consists of 23 pages with good plans and sections of the mine. The mill treated 208,936 tons of ore, averaging $13.67 per ton, and recovered bullion to the value of $2,688,354, an increase of $222,134 over the preceding year. Net profits in 1914 were $1,786,679, or practically 60% of the $3,000,000 issued capital. Dividends amounting to $1,170,000 were paid. The surplus carried forward was $1,126,743, and of this amount $664,603 represented cash and bullion. Expenditure for plant amounted to $305,621, and when the present additions to the mill, now under way, are completed, the capacity will have been raised from 500 to 1600 tons per day. Operating costs were reduced to $4.50 per ton, but at present these are about $4.37. Further reductions will be made as the capacity of the plant is increased.

Ore reserves are estimated at 1,162,960 tons averaging $11.49 per ton, or a total of $13,358,420. This represents an increase in gross value over the preceding year of about $2,000,000. In addition there are a large number of known veins which have not been developed and on which it is impossible to estimate any tonnage. So far a total of 54 veins has been found on the

property, and of these, only 12 have been opened underground. Development totaled 10,662 ft., and 10,227 ft. of diamond drilling. One of the most interesting sections of the report deals with the deep drilling. One hole was bored to a depth of 2000 ft. on the incline, equal to 1450 ft. vertical, and cut 13 mineralized zones. Of these, six were five feet or more in width, and nine assayed $6 or over per ton. The information furnished by this hole, shows that there is no change in the formation to a depth of 1450 ft. vertically, and also that there is no change in the vein characteristics at that depth. The management states that the assays obtained are such as might be expected if the hole had been bored at any random point below the 200-ft. level. Costs and other data will be given in another issue of this journal.

STANDARD OIL COMPANY (CALIFORNIA)

The report of this great corporation is for the year 1914. The output of crude oil from its own wells was 12,727,291 bbl., against 9,700,209 bbl. in 1913. Net pipe-line runs showed a daily average of 109,949 bbl, compared with 85,902 bbl. Stocks of crude oil at the end of 1914 amounted to 26,058,077 bbl., an increase of 1,747,767 bbl. About 8,000,000-bbl. capacity of steel tanks was constructed, also additions to the pipe-lines, service stations, and marine department.

The financial results were as follows:

Profits	$12,771,398
Depreciation	2,713,061
Net earnings	$10,058,337
Dividends paid	4,856,098
Carried to surplus	$ 5,202,239
Total surplus	40,290,983

The capital stock authorized is $100,000,000, of which $49,686,655 has been issued. Assets total $97,298,283, plant account absorbing $65,415,338. Dividend No. 25, of $2.50 per share, the regular quarterly disbursement, was paid on March 15, 1915.

RICO-WELLINGTON CONSOLIDATED MINING COMPANY

This Company is controlled by Utah people, and operates a gold-silver-lead-copper-zinc property at Rico, Dolores county, Colorado. The report for 1914 states that the year was not remarkable for production or profits, but the future is bright. Early in 1914 shipments of copper ore were stopped on account of freight charges, resumed on July 23, and stopped again on August 12 owing to the war. Development amounted to 2004 ft., mostly in new ground, resulting in opening a good tonnage of copper ore. There is also in reserve several hundred thousand tons of iron sulphide, containing about 2% copper, and 3 oz. silver per ton. This will be treated locally as soon as possible.

The output was as follows:

Ore.	Tons.
Copper	2,278
Lead	1,604
Iron	656
Zinc concentrate (lessees)	67

The revenue was $34,704 from all sources, and the debit balance $1913. The credit balance at the end of 1914 was $102,620.

BUCKEYE BELMONT MINES COMPANY

This Company is developing 72 acres of ground adjoining the Tonopah Belmont and Halifax mines at Tonopah, Nevada, and the report, which contains a considerable amount about the Company's prospects and costs, is for the year 1914. Letson Balliet is in charge.

Underground progress was 1030 ft., which cost $14,546, or $14.12 per foot. Of this, labor cost $7836, and material the remainder. No. 1 shaft is 1234 ft. deep, and cross-cuts have been driven north and south in the rhyolite dike for two-thirds of the distance. From these points drifts were started east and the ore-bearing trachyte was entered. Since December 1, 1913, hoisting has been done by the Balliet counterbalance system, and the total cost per trip has been reduced from 30c. in November of that year to 6.5c. throughout 1914, save in the first two months.

OSCEOLA CONSOLIDATED MINING COMPANY

In 1913 this Michigan copper company, with others, had a strike of miners, and in 1914 work was stopped on account of the copper market. Results of the past three years are as follows:

	1914.	1913.	1912.
Rock stamped, tons	1,108,447	735,044	1,246,557

MASS CONSOLIDATED MINING COMPANY

The report of this Michigan copper company covers the year 1914, during which the strike of 1913 and the European war affected results. Operations resulted as follows:

'Rock' hoisted, tons	247,692
'Rock' stamped, tons	209,354
Mineral produced, pounds	4,487,425
Refined copper produced, pounds	2,944,952
Mineral in rock, per cent	1.072
Copper in mineral, per cent	65.62
Refined copper per ton of 'rock' stamped, pounds.	14.07
Cost per ton of 'rock' stamped, at mine	$1.706
Cost per pound refined copper at mine, cents.	12.132
Cost of smelting, freight, and marketing copper, cents	1.394
Total cost per pound refined copper, cents.	13.526
Total cost per pound refined copper, including strike expense, construction, and interest, cents.	14.052

	1914.	1913.	1912.
Sales of copper, pounds	2,955,952	1,213,545	2,045,006
Average price received, cents...	12.751	15.6	17.0205
Copper receipts	$ 375,530	$ 189,325	$ 248,070
Total receipts	481,076	189,557	349,354
Total expenditure	416,530	217,564	338,364
Surplus	64,546	*28,006	10,000
Previous cash assets	*18,660	9,347	30,710
Total surplus	45,887	*18,658	41,770
Profit and loss surplus	45,887	*18,658	9,348

*Deficit.

Ore reserves are estimated as 1,250,000 tons, the Butler lode adding 287,559 tons to the total. In B and C shafts it is increasing in width, according to the superintendent, E. W. Walker.

MINING DECISIONS

Oil Lands—Right of Adjoining Owners

Oil in the earth belongs to the owner of the soil. It resembles water as it exists in the earth, its original source is uncertain, and even the exact location thereof may not be known. The owner of the fee has a right to pump, use, and sell it, even if his wells are so located on his premises as to lessen the flow of his neighbor's wells dug prior to his.

Rumsey v. Sullivan (New York), 150 New York Supplement, 287. November 11, 1914.

Millsite in National Forest—Reinstatement

A decision by the Department of the Interior canceling a millsite entry, without passing upon the validity of the millsite claim or location or the claimant's possessory rights or ownership in the premises, in no wise affects the legal rights, if any, the claimant may have in the millsite claim; and where the land is included within the limits of a national forest, but excepted from the operation of the proclamation creating the same, by reason of being covered by the millsite claim, the subsequent cancellation of the millsite does not have the effect to make the land a part of the national forest or deprive the Secretary of the Interior of jurisdiction to reinstate the canceled entry with a view to the issuance of patents theron.

Alaska Copper Co. *et al.* (Land Department), 43 Land Decisions, 257. May 28, 1914.

Assessment Work—Failure to Perform

A miner went on a group of mining claims owned by his brother's estate to perform the annual assessment work thereon, in order that, by protecting the title of the estate he might eventually recover a claim he held against it. While on the ground he occupied a cabin built by and belonging to the estate. He was unable to furnish sufficient money to do the work himself, and although the representative of the estate promised to raise some more, this was not done until after the first of the following year, when the claims were re-located by himself and another. Held, that he did not occupy a fiduciary relation toward the estate, that insufficient work having been done prior to the first of the year, the claims on that date became open to relocation, and that the subsequent performance of work by the former owners could not validate their forfeited claims.

McDonald *v.* McDonald (Arizona), 144 Pacific, 950. December 9, 1914.

Mineral Locations in National Forests

The banks and beds of non-navigable, unmeandered streams on lands belonging to the United States containing valuable mineral deposits may be included in locations and entries under the mining laws. The general mining laws are operative with respect to deposits of gold or other metalliferous minerals within the limits of national forests or power-site withdrawals the same as with respect to like deposits elsewhere on the public domain. If the evidence is convincing that the claims in question contain deposits of gold of such quantity, quality, and value as would warrant a prudent man in the expenditure of labor and means with a reasonable prospect of success in developing valuable mines, they are disposable under the mining laws, notwithstanding their possible or probable value for or in connection with the development of electrical power.

Cataract Gold Mining Co. *et al.* (Land Department), 43 Land Decisions, 232. April 27, 1914.

RECENT PUBLICATIONS

Researches on cobalt and cobalt alloys, conducted at Queens University, Kingston, Ontario, for the Mines Branch of the Department of Mines of Canada. P. 49. Ill., plans, 14 plates. Ottawa, 1914. Gives the results of interesting tests made on this metal, recovered from the smelting of ores from Cobalt.

From the Fifth Annual Report of the Florida State Geological Survey:

Origin of the Hard Rock Phosphate Deposits of Florida. By E. H. Sellards. P. 58. Ill., maps. The hard rock deposits extend through a distance of about 100 miles, with variable width. Forty plants were operated in 1912.

Mineral Industries and Resources of Florida. By E. H. Sellards. P. 94. Illustrated. The output of all minerals in 1913 was valued at $10,646,628, of which phosphate rock accounted for $9,563,084, the value of 2,545,276 long tons.

United States Geological Survey publications, Washington, D. C., 1914:

Folios of the Geologic Atlas of the United States:

Van Horn Folio, Texas. By G. B. Richardson. No. 194. P. 9. Ill., 3 maps, 9 plates.

Raritan Folio, New Jersey. By W. S. Bayley, R. D. Salisbury, and H. B. Kümmel. Surveyed in co-operation with the Geological Survey of New Jersey. No. 191. P. 32. 5 maps, 1 plan.

Eastport Folio, Maine. By Edson S. Bastin and Henry S. Williams. In co-operation with the Geological Survey of Maine. No. 192. P. 13. Ill., 4 maps, 23 plates, and 1 page descriptive of fossil formations.

Mineral Resources of the United States, 1913. Part I.—Metals. P. 901, ill., chart, index. Part II.—Non-metals. P. 1617, maps, 3 charts, index. These volumes contain all that valuable data issued by the Survey first in the form of press *Bulletins*, and then as *Abstracts*, from which copious abstracts have been published in the *Press* as they are published. It is therefore not necessary to cover any of the same matter again. The authors are well known officials in the department. The volumes continue to grow, the total of the pages being 2518 against 2297 in the previous publication.

San Francisco Folio, California. By Andrew C. Lawson. No. 193. P. 24. Ill., 15 maps, 1 plan, 10 plates. A review of this work appeared in the *Press* of March 6. The field edition of the folio is now ready for distribution. It contains topographic, geologic, and structural maps of five rectangular areas known as quadrangles, which embrace the San Francisco and Marin peninsulas, San Francisco bay, and the east shore of the bay almost as far as Mount Diablo. In the text accompanying the maps, the character of the different rocks is described in detail and the mineral deposits of economic value are pointed out. The folio also contains a number of halftone views of feafures that are of geologic interest, including one showing clearly the trace of the fault along which occurred the earthquake of 1906. The field edition of the folio is sold by the U. S. Geological Survey at 75c. per copy.

New Machines and Devices

Diesel Engine Operating at the Exposition

There are many working exhibits in the Palace of Machinery at the Panama-Pacific Exposition, and one of the most interesting is that of the Busch-Sulzer Bros.-Diesel Engine Co., of St. Louis, represented in San Francisco by W. S. Heger. Considerable expense and care has been taken in exhibiting this machine. It is known as the type 'B,' vertical, 4-cylinder, single-acting, 4-stroke cycle, enclosed crank case, medium-speed Diesel engine, with 3-stage air-compressor integral. In the factory at St. Louis only Diesel engines are manufactured, so that it is a specialty of the plant. The floor space occupied by this 500-hp. engine is 16 ft. 4 in. long, and 26 ft. 6 in. with alternating-current generator direct connected, 16 ft. high from floor to top of cylinders, and 10 ft. 8 in. wide. An inspection of the engine and claims by the makers reveal the following

500-HP. DIESEL ENGINE AT THE PANAMA-PACIFIC EXPOSITION.

points: The machine, fitted with a 15-ton flywheel, is direct connected to a Westinghouse 335-kw., 250 volt, 1340-amp. generator, running at 200 r.p.m. The cycle of operation is as follows: cylinders charged with compressed air are used to start the engine. When in motion the down stroke draws in atmospheric air. The up stroke compresses this air to from 450 to 500-lb. pressure, during which time a temperature of 1000°F. is reached. At the top of this stroke, fuel oil of 23°B. is sprayed into the cylinder for 10 to 15% of the stroke, by air at 1000 lb., compressed by the 3-stage compressor which is part of the unit. The oil burns and the next stroke is the power stroke. The final part of the cycle is where the up stroke expels the gases produced. Oil consumption under operating conditions is 30 gal. per hour for the 500-hp. set. Below 50% load the proportion of oil used increases. The cost for fuel is 0.2c. per kw. hour. By heating to about 120°F., oil of 14° gravity can be used. The governing apparatus consists of a ring, which flies out when the speed is too high, and knocks a trip which cuts off the fuel. The governor runs on ball bearings. As to the fuel pump, the control of which is the chief duty of the governor, its function is to measure out and pump the fuel to the fuel valves. Two measured quantities of fuel are pumped by it to each fuel valve before each opening. For an engine operating at 200 r.p.m., with a power impulse each revolution, this means that the fuel delivered to the atomizers with each fuel pump discharge stroke, is the exact quantity necessary to care for the load for just one four-hundredths of a minute interval. All lubrication of the engine is done by a pump, and if the temperature of any bearing should rise, the pressure can be raised to 65 lb. Thermometers are placed at the oil inlet and outlet. Cam-shafts run in oil, and cams are so spaced as to leave no chance to move. Each cylinder being practically an engine in itself, makes repairs to valves an easy matter, and the whole engine works without trouble even if one cylinder is not giving power for a time. All cylinders are water-jacketed. Objections to the Diesel engine have included the carbonization of oil, air pockets in the cooling system caused by dead air or formation of steam, and the operator getting burned by exhaust pipes. These defects are claimed to have been successfully overcome by the Busch-Sulzer company. In the starting of this exhibit at the Exposition, on February 20, President Wilson in Washington closed a circuit there, which in turn closed the wireless key at Tuckerton. This sent the impulse to be caught by the antennae on the tower of jewels at the Exposition, the first time that the wireless had been used across the continent on power service. The impulse sent operated a galvanometer at the base of the tower, which in turn closed the local circuit that operated the electric release on a 500-hp. Diesel engine. This released a weighted lever which started the engine.

Small Mazda Lamps With Concentrated Filaments

The distinctive features of the concentrated filament Mazda lamps of high wattages have proved so popular that the Edison Lamp Works of the General Electric Co. has developed vacuum Mazda lamps of similar appearance in the 25, 40, and 60-watt sizes. This concentrated filament construction gives greater vertical distribution of light than the regular Mazda lamps of corresponding wattages. The new lamps will, therefore, be employed where natural distribution of light downward is required. They can be used in existing sockets and fixtures. These lamps will be made in the same sized bulbs as the corresponding regular Mazda lamps, will have the same spherical watts per candle-power efficiency, and will have a rated average life of 600 hours.

Commercial Paragraphs

The West Kentucky Ore Co., of Marion, Kentucky, has given the DENVER QUARTZ MILL & CRUSHER Co., of Denver, Colorado, a rush order for a 50-ton Denver quartz mill and an Isbell concentrator to be used on zinc ore.

F. O. Williamson, special sales representative for the Hardinge conical mills, has removed his office from room 330 to room 545 Old Colony building, Chicago. Mr. Williamson has been identified with the Hardinge mills for the past six years.

In illustrated *Pamphlet* No. 605, the HAYWARD Co., of New York shows actual use of the 'Hayward' buckets. These are doing the following work: transferring cement clinker; handling coal and ash at a power house; moving run of mine bituminous coal; rescuing a locomotive crane from a river; foundry work; an electric motor-clam-shell bucket, on which the motor is arranged in the upper centre of the bucket itself; a three-blade orange-peel bucket handling boulders up to 10 tons weight; and in cofferdam work for bridges and similar construction.

Volume 110 SAN FRANCISCO, MARCH 27, 1915 Number 13

CARE of the health and happiness of workmen has become an integral part of the management of large business enterprises. Begun from humanitarian motives it soon became evident that wherever labor is an important factor in the cost of operation great economy can be effected by careful attention to the human mechanism, making sure that it is in good repair, well lubricated, and working smoothly. Because of the large number of men employed the United States Steel Corporation has been able to carry out this work on the most advanced scale. In accident prevention alone it was found that a saving of nearly five million dollars in casualty expenses was made in three years and, deducting expenditures for safety, a net gain of $2,772,000. How it is being done is told in this issue.

Taking Care of the Human Mechanism 469

ARTICLES

MILLUNI TIN-MINING DISTRICT, BOLIVIA.

By Francis Church Lincoln..... 470

The Milluni district was a large producer of silver in the early days of the Spanish occupation of Bolivia, but the tin was not discovered until 1890. French capital has been secured and a number of mines are now producing. The ore occurs in veins of good size and is concentrated in small mills of modern design. The cost of mining and milling is only about $3.50 per ton of ore, but freight and export amount to $140 per ton of 64% concentrate.

ENGLISH PRODUCTION OF CYANIDES 473

English cyanide plants are now being worked to full capacity to supply Australia, South Africa, India, and other countries. Detail figures as to exports for 1913 are given.

SAFETY, SANITATION, AND WELFARE IN THE UNITED STATES STEEL CORPORATION EXHIBIT.

By Arthur A. Willoughby..... 474

The United States Steel Corporation, through its subsidiary companies, employs 225,000 persons, representing a population of a million souls. Labor is a large item in the cost of production; it has been found good business to devote as much study to the care and operation of men as of machines. The returns are surprisingly high, and the work has been developed to a further extent by the Corporation than by any other organization.

OPPORTUNITY FOR WORKMEN AT ANACONDA..... 480

The Anaconda Copper Mining Co. is affording means for its smelter workmen to acquire small farms on which they can raise a large part of their food requirements as an avocation from their daily work.

PLATINUM ANALYSIS.

By F. Mylius and A. Mazzucchelli..... 481

Separation of the metals of the platinum group is both difficult and tedious. The authors give a scheme which they have devised which offers certain advantages as compared with present methods.

ROBERT H. RICHARDS—AN APPRECIATION.

By David H. Browne..... 483

It is only rarely that a college professor is able to contribute much to the practical development of an art, especially such an art as mining. One who is at once teacher, thinker, investigator, scholar, and practitioner of the art of ore dressing commands corresponding respect. One who has the gift of Irish wit here pays tribute to him.

WORK on the Marysvale potash deposits is to be started with a $3,000,000 plant, to be built by the Armour interests, according to reports from Utah.

THE School of Mines at Virginia City, Nevada, is to continue its useful work; the legislature having increased its appropriation for the support of the school.

FATAL accidents in the coal mines of the United States showed a decrease of 334 in 1914, according to a report made by Mr. A. H. Fay to the Bureau of Mines.

NEW regulations of the Customs Service provide for a wet assay of imported ore and bullion. The detailed regulations can be obtained on application to the Treasury Department.

MISSOURI has thrown its hat into the ring and will proceed to 'bust the smelter trust,' according to an announcement made by the Attorney General. The daily papers do not state whether the lead or zinc smelters are to be the first object of attack. Those who know the affectionate regard in which the various smelting companies hold each other will be especially interested in the outcome of the suits.

IT is particularly opportune that just at this time, when the attention of Americans is directed so largely toward California, an excellent report on the petroleum industry, one of the most important of the state, should be issued. This has been prepared by Mr. R. P. McLaughlin, under the direction of Mr. F. McN. Hamilton, State Mineralogist of California. As yet, only the atlas, of the same size as the geologic folios of the United States Geological Survey, is available, the accompanying text being still in the hands of the State Printer. The atlas, an excellent piece of work, not only contains large scale topographic and geologic maps of all the oil-producing districts of California, but is also illustrated with photographs and line drawings of the fossil flora and fauna of the oil series. The State Mineralogist and the author are to be congratulated on having made such a report available in time to be of service to the many geologists and oil men who will doubtless be drawn to California by the Exposition and the scientific congresses which are to be held in connection with it during the summer and autumn.

IT is a pleasure to record the dedication, March 16, of Julius Rosenwald hall, a magnificent structure at the University of Chicago which is to be devoted to research and instruction in geology and geography. Walker Museum can now be devoted to its original purpose, the housing of the collections of the departments concerned. The new building is a steel and stone structure admirably adapted to its purpose and including, we are glad to note, rooms to be devoted to special research on problems relating to ore genesis. This will give Mr. A. D. Brokaw the needed facilities for further studies of problems in secondary enrichment such as he has so well begun. The building as a whole will be mainly, and properly, regarded as a tribute from one of Chicago's public spirited business men to the work done both in investigation and teaching by Messrs. T. C. Chamberlin and R. D. Salisbury, the two men whose work in geology has done so much to clear up fundamental problems and afford a basis for specific research in many lines.

ON March 18 the gold medal of the Mining and Metallurgical Society of America was presented to Mr. Robert H. Richards, professor emeritus of mining in the Massachusetts Institute of Technology. The presentation was made at a dinner of the Society and in the presence of a thoroughly representative gathering of professional men. Mr. W. R. Ingalls occupied the chair, from which he delivered an appropriate summary of the work done by the great authority on ore dressing. Other speakers were Messrs. William L. Saunders, F. A. Lidbury, Charles W. Goodale, and David H. Browne. The last of these made a speech that had all the qualities of an oration; it was intellectually stimulating and highly appropriate to the occasion. We take pleasure in giving our readers the text of this appreciation of Professor Richards. For ourselves, we desire to record our high respect for him as an enthusiastic teacher, a persistent investigator, a systematic recorder, and a successful seeker after scientific truth. Assuredly the two landmarks in the story of ore dressing are Rittinger and Richards. His books are part of our metallurgical heritage. It was a keen delight to us to be present on the happy occasion when the Professor, in his cheerful and vigorous old age, received the sincere thanks and respect of his fellow practitioners. We trust that his kindly personality and useful labors may continue to exert a characteristic influence for many years to come.

RETIREMENT of Mr. O. M. Bilharz from the service of the St. Joseph Lead Company loses to that concern one of its most capable employees, and one whose sound ideas of technology and sterling character have contributed greatly to its success. The St. Joseph and Doe Run companies, now joined, have succeeded in spite of rather than by virtue of the direction given them by their titular managers. Our readers are already informed of the situation, which is, in effect, that the control of the companies has been inherited by men who have at the same time failed to inherit the knowledge and genius for hard work that marked the pioneers of the Company. Second-growth hickory has always been at a discount in the Middle West, and the second generation of mine owners often warrants the same prejudice. The recent substitution of Mr. C. H. Crane for Mr. D. A. Jones as president has not helped greatly. The fundamental trouble is that men not skilled in technology insist upon passing upon technical questions and the able men on the staff of the St. Joseph company are not given a free hand. A designer of power boats may be an excellent business adviser and so properly the head of a board of directors, but he is not, unless otherwise qualified, fitted to handle the complex management of so technical a business as mining and smelting lead ore, while long-distance management will break any company that is not too rich to spoil, as seems true of the St. Joseph.

VALUE of geological work as an aid in directing and developing mining operations can scarcely be too much emphasized. At the South Lake mine in the Michigan copper mining district, a vertical shaft was sunk to a depth of 626 feet. This shaft cut two beds of amygdaloid, carrying copper and dipping to the north. At the 600-foot level, a cross-cut was driven 1379 feet southeast. This cross-cut shows that the dip changes from north at the shaft to distinctly south at 900 feet from it. As the cross-cut was continued, the various beds of amygdaloid, trap, sandstone, and conglomerate cut were found to be identical in character and relationship, one to the other, with the beds exposed dipping to the north in the shaft. This cross-cut confirms the theory of Mr. L. L. Hubbard, consulting geologist for the Company, deduced from diamond drilling done several years ago, that the beds dipping south were simply one limb of an anticline, the top of which had been eroded and covered with about 250 feet of drift. Another case where geological study might have been of value is at the Mass mine. It is reported that the important discovery has been made at this property within the past few months that only part of the full width of the Butler lode was being mined. Mining has always been confined to the lode between two well defined walls, but on following a shoot of ore on the ninth level, the foot-wall was cut and additional ore of good copper content was disclosed. The nature of the ore deposits in the Michigan district almost demands an investigation for parallel lodes, as has been clearly shown at the Quincy.

CONSTITUTIONALIST EXTORTION AND THE WORCESTER AFFAIR

The operation of mining properties in Mexico during the past three years has been fraught with difficulties both numerous and varied. Constitutionalist domination of northern and central Mexico brought with it a marked change in the status of the mining industry that has been particularly pronounced with those properties formerly controlled by sympathizers of the so-called *Cientifico* party. Almost without exception the properties so held have been confiscated by the Constitutionalists and are at the present time either idle or being worked under lease to followers of Francisco Villa. This leasing system of confiscated property, it would seem from a recent report from Chihuahua, has resulted in many evils. In one instance, which has been forcibly brought to our attention by the unwarranted imprisonment of our correspondent in Chihuahua, this system is being used as a blind for the practice of extortion by Constitutionalist authorities.

On February 13, Mr. Leonard Worcester, Jr., manager of the Chihuahua Ore Testing & Sampling Company of Chihuahua, Mexico, and our local correspondent, was confined in the Chihuahua penitentiary without cause, as reported to the State Department at Washington by Consul Marion Letcher, and until March 12, the time at which the report was sent to us from Chihuahua, had been held at the penitentiary; a good part of the time *incommunicado*, or in solitary confinement with no connection with the outside world. Those of our readers who have lived among the Mexican people and are familiar with what Mexican penal institutions are like, will appreciate Mr. Worcester's position and surroundings; to those who have not, we would recommend a perusal of Carlo de Fornaro's description of a night in Belem prison.

Mr. Worcester wrote us from the penitentiary that he is charged with conspiring with the Granby Mining & Smelting Company, of St. Louis, which he represents in Chihuahua, to defraud Francisco Rueda Quijano of money due to him on ore purchased from him by the Granby company and mined at the Compañía Minera Ignacio Rodriguez Ramos property, which had been confiscated by the Constitutionalists and leased to Sr. Quijano. The Granby company had instructed Mr. Worcester to attend to the shipment of the ore from Chihuahua and to pay Sr. Quijano, the lessee, 75 per cent of the value of the ore, export duties, and other necessary expenses, from funds furnished by the Granby company for this purpose; Mr. Worcester being in no way responsible for the payment of any money. After the negotiations for 15 cars of ore were begun, the Granby company, fearing action against it by the original owners of the property, deemed it advisable not to close the sale of this shipment, and as a result Sr. Quijano had Mr. Worcester placed under arrest.

Ample documentary evidence has been offered to

prove Mr. Worcester's innocence of the charge of attempt to defraud; the Granby company has assured the authorities that Mr. Worcester was not responsible in any way, and has offered to settle in full for all the ore according to the contract. As the Granby company showed a willingness to fulfill the contract for the purchase of the ore, upon Mr. Worcester's imprisonment, Sr. Quijano took it upon himself to increase the valuation of this shipment to a price which was absolutely prohibitive. His 'reason' for this was that Sr. Villa was personally interested in this shipment and was to receive 80 per cent of the sale price, and that he, as Villa's representative, did not propose to arbitrate the value of the ore and would hold Mr. Worcester in prison until he received the amount demanded.

Mr. Worcester was refused bail, although Sr. Diaz Lombardo, the Constitutionalist Minister of Justice and Foreign Relations, had promised it to Consul Marion Letcher. Mr. Worcester remained in prison in surroundings which are beyond endurance to even the peon *ratero*. Consul Letcher, after a careful personal investigation, advised the State Department of the facts in the case, declaring, according to the report furnished us, that Mr. Worcester was entirely innocent and showing clearly that the entire case was a flagrant attempt at extortion by the Constitutionalist authorities, a practice which has become popular with those in power, although foreigners, and American citizens in particular, have been generally exempt.

There is an adage in Mexico which has been handed down from one generation of *gringos* to another, that when a European resident is in difficulty the proper procedure is to go to his consul, but with the American the proper procedure is to go to jail. Mr. Letcher the American consul at Chihuahua, is an exception to this rule and holds the esteem of all Americans in that part of Mexico. However, when his hands are not upheld by the State Department his personal protection is of little avail. Such is reported as the status of the Worcester affair. Mr. Carothers, the special agent to whom this matter was referred by the State Department, and whose record of inefficiency is a by-word with Americans on the other side of the Rio Grande, made a subsequent visit to Chihuahua in company with Mr. Duval West, but apparently made little effort to investigate the matter, not even taking the trouble to see Mr. Letcher or Mr. Worcester in regard to the affair. However, he reported to Washington that Mr. Worcester had not applied for bail, which would be allowed upon application, and that in his opinion the Constitutionalist government was not interested in holding Mr. Worcester. The State Department accepted this report in place of the report based on Mr. Letcher's personal investigation, and although bail had repeatedly been applied for before and since Mr. Carothers' visit to Chihuahua, it had been as often refused and Mr. Worcester remained in prison.

Upon being advised of the position of our representative, we took the matter up through President Wilson and are pleased to learn from the following telegram that Mr. Worcester is about to be released:

"Washington, D. C., March 20, 1915.

"E. H. Leslie, care *Mining Press*, San Francisco.

"Reference your telegram to President: Department has made earnest efforts through Consul Chihuahua and special agent Carothers to obtain release of Worcester on bail, as a result of which it has been advised that he will be so released upon his application.

"W. J. Bryan,
"*Secretary of State.*"

TAKING CARE OF THE HUMAN MECHANISM

One of the most interesting phenomenon apparent to the student of the problems of society is the slowness with which new ideas progress until they reach a certain point, and the velocity with which they attain general acceptance thereafter. For many years it has been apparent that the most important factor in American industry is the labor item in production cost, since wages have rapidly increased in the face of continuous attempts to decrease market prices for finished products. For a long while efforts to decrease production costs were chiefly directed at replacing hand work by machines, speeding up the workman, and eliminating useless work. Careful thought and detailed study has been devoted to improving the design of machines, while careful inspection assures that they are always kept in repair and operate under the most favorable conditions. It is a trite saying that the human body is the most wonderful mechanism in the world, but the obvious implication which this involves seems never to have been perceived until recently. Any kind of man would be put at any kind of a job, except in the case of railroad engineers no one stopped to consider whether his eyesight was good enough to see well what he was doing, or whether the light in which he worked was too dim or too bright. No superintendent would allow machines to work under conditions under which they became overheated and so dissipated energy, but few superintendents gave a thought as to whether their men were working in air that was too hot or too cold or lacking in freshness. Everybody knows that the mind has such a powerful effect on muscles that bad news will sometimes cause a person to faint. It seems evident that if a workman is disturbed in his mind by unsatisfactory conditions at home his work at the plant will inevitably suffer. The management of some of the large organizations finally perceived these relations and proceeded to take them into account, with the immediate result that surprisingly large improvement in the work of their employees was brought about. Work of this sort must needs be performed chiefly by the corporations, for what an individual cannot afford to do for himself can be done to advantage by an organization for the benefit of all. In this issue, Mr. A. A. Willoughby describes what has been done by the United States Steel Corporation, and from his account operators of small properties should be able to glean many valuable suggestions.

Milluni Tin-Mining District, Bolivia

By FRANCIS CHURCH LINCOLN

The Bolivian tin deposits lie along a line some 400 miles in length which follows the general trend of the main range of the Andes southeasterly from Carabuco, near the Peruvian boundary, to Portugalete, not far from Argentine territory. The northernmost producing district is that of Milluni, which is in the northern part of the department of La Paz, a short distance north of the city of La Paz. This district is in the western foothills of the main range, a few miles southwest of Mount Kacaca, a magnificent snow-clad peak which towers to an altitude of more than twenty thousand feet above sea-level. The tin mines themselves

MAP OF VICINITY OF LA PAZ.

are situated at elevations ranging from 14,000 to 17,000 feet.

The Milluni District

The Milluni district was a large producer of silver in early Spanish times. The ancient silver mine was called Huayna Potosí ('Little Potosí' in Aymará Indian), after the famous camp of Potosí. It was abandoned long before the discovery of tin in the district, and the tin mined today comes from other veins. Don Ramon Irusta showed Sr. Collao a piece of ore from the Milluni district in 1890. Sr. Collao thought it might contain tin, and turned it over to Domingo Lorini to assay. Tin was found in the sample, and Collao, Lorini, Irusta & Co. located the Milluni mine.

Other mines were soon discovered in the district, including the Huayna Potosí tin mine, near the ancient Spanish silver mine of that name. The mines of Milluni and Huayna Potosí were united under the control of a French syndicate which is said to have expended $2,800,000 in the development of the ground and the construction of tramways, mills, and buildings, but was unable to make a success of the enterprise. This syndicate recently sold out to Huet Brothers, Frenchmen living in La Paz, and they are at present successfully operating the property. The other mines in the district are worked on a very small scale. The following table shows the names of the various mines, the names and nationalities of their owners, and the rate at which they were producing in the spring of 1914.

Mines in the Milluni District

Mine.	Operator.	Nationality.	Mo. prod., tons of tin conc.
Milluni	Huet Hermanes	French	20
Huayna Potosí	Huet Hermanes	French	50
Churihumani	Francisco Sanchez	Bolivian	4
Vesuvio	Compañía Minera Vesuvio (E. L. de Romano, manager)	Peruvian	*
Chacaltaya		German	†
Ventanani	Lorini, Olivia y Alborta (Hector Lorini, mgr.).	Bolivian	½
Kala Uyu	Lorini, Hijos y Compañía (Hector Lorini, mgr.).	Bolivian	2
Vilaque placer	Vilaque (Bolivia) Tin Mines, Ltd. (H. Lancaster Hobbs, mgr.)	English	*

*Under development. †Shut down.

All the operators have offices in the city of La Paz as well as at their mines.

The general appearance of the Milluni district is shown in the illustration. The Milluni mine is in the foreground, and the Vesuvio, Ventanani, and Churihumani mines in the background. The view was taken looking southward. The Kala Uyu and Chacaltaya mines are still farther south, on the opposite side of the range shown, while the Huayna Potosí mine and Vilaque placer are in a similar range to the north. The whole region is above timber-line, and the vegetation is seen to consist of coarse grasses and occasional shrubs. The topography of the district is glacial. The country rock consists of alternating thick beds of slate and quartzite of Lower Devonian age, with dips ranging from 0 to 45°. Intrusive dikes of quartz-porphyry occur in both the Milluni and Huayna Potosí mines. The ore deposits appear to be of pneumatolytic origin and genetically connected with these igneous rocks.

The Milluni mine is 12 miles by good road north from the city of La Paz. Starting at an elevation of 11,800 ft. above sea-level, a rapid ascent of 1400 ft. is

FIG. 1. MILLUNI.
FIG. 2. MILLUNI MILL.
FIG. 3. HUAYNA POTOSI MINE.
FIG. 4. HUAYNA POTOSI MILL.

made to the tableland of the Alto, seen in the illustration. Crossing this plateau and gradually and continuously ascending, the traveler passes the Indian village of Milluni ('Alum' in Aymará), whose inhabitants are gypsum burners; and thence beside Milluni lake, whose waters supply La Paz with electric power, into the foothills of the snow-clad mountains where the mine is situated.

Milluni, 15,150 ft. above sea-level, is shown in Fig. 1. The black slate and gray quartzite at the Milluni mine strike S.20°E. and dip about 25° southwest. They are cut by a series of roughly parallel veins, with strikes

FIG. 5. LA PAZ; ALTO TABLELAND IN BACKGROUND.
FIG. 6. VIEW OF MILLUNI DISTRICT.

ranging from N.10°W. to N.20°W., and nearly vertical dips. The vein filling consists of slate, quartzite, quartz porphyry, quartz, limonite, pyrite, arsenopyrite, and the ore mineral cassiterite.

In some of the veins, the sulphides have been leached out near the surface, leaving caves, in the bottom of which the cassiterite is found mechanically concentrated and mixed with quartz and limonite. Rich, loose ore formed in this manner is called *llampu*, which in Aymará means soft.

The ore as a whole is low grade, but fairly regular. The veins are of good width, ranging up to 20 ft. The vein matter is frequently soft, but the walls are usually firm, and stand well without timbering. All the drilling in the district is done by hand. Some 270 Aymará Indians are employed in the Milluni mine. The miners receive from $1 to $1.20 per day, helpers $0.64 to $1, and women $0.48 to $0.56.

The Milluni mill, shown in Fig. 2, has a capacity of 60 long tons per day. About 80 men are employed in and around the mill. Of these, 10 or 12 are millmen paid at the rate of $1.20 to $2.40 per day, the rest being helpers and women paid as at the mine. The mill is connected with the principal mine openings by a system of aerial tramways. Power is furnished by a Pelton water wheel, which derives its water supply from a series of small glacial lakes. When the ore arrives at the mill, it is dumped upon a 4 by 8-ft. grizzly, with 2-in. openings between bars. The oversize is crushed in a jaw crusher and falls into a bin, while the undersize passes directly into the same bin. This bin feeds two Harvey pneumatic stamps. These stamps were originally provided with 18-mesh screens, but the screens wore very rapidly and have now been removed, the large particles which collect in the launder being shoveled back to the stamps, while the finer pulp runs to a 4-spigot classifier.

The first classifier spigot feeds two Wilfley tables, while the second, third, and fourth spigots each feed one table. The tailings from these five Wilfley tables, together with the overflow from the classifier, go to two more Wilfleys. When the table middling contains sulphides, it is collected and roasted in a reverberatory furnace, ground in a Reynolds Chilean mill, and treated on four other Wilfley tables. The tailings from all the Wilfleys are re-treated on 11 circular convex buddles. The milling system is thus seen to be rather crude, being especially poor through lack of provision for the concentration of slime; so while the loss is said to be 10%, it is probably higher. This mill produces about 20 tons of tin concentrate, containing about 65% metallic tin, per month.

Going up the mountain back of the Milluni mine past the glacial lakes that supply the mill with water to an elevation of 16,200 ft., one comes to the Ventanani mine. The country rock flattens as one ascends, having a 5° westerly dip at the mine. The veins are similar in all respects to those at the Milluni mine below. Only a few men work this property, and there is no mill.

What is probably the southeast continuation of these veins is found on the farther side of the mountain at the Kala Uyu and Chacaltaya mines. The range is, however, well-nigh impassable, and to reach these mines, which are situated on the La Paz river, a 3½ hours' detour on muleback toward the south is necessary. From these mines down the river to La Paz is a 4 hours' muleback ride over good roads, so La Paz is their shipping point, whereas the other mines in the district ship from Alto station on the edge of the tableland above La Paz.

The country rock at the Kala Uyu mine has a steeper and more irregular dip than at the Milluni and Ventanani mines, averaging about 20° in a northwest direction. Development work has not been carried to the same extent as upon the opposite side of the range. The veins are nearly vertical, and as far as developed appear to be richer, narrower, and more irregular. The ore is oxidized and seems to be confined to the quartzite instead of occurring in both country rocks as at Milluni. A small quantity of ore is produced from the Kala Uyu mine. It is milled by hand by Indian women using buddles.

The Huayna Potosí mine is 6 miles, by poor trail, north from the Milluni mine. Two ridges, 15,970 and 16,170 ft. in altitude respectively, are crossed to reach the camp at the mine. This is shown in Fig. 3. It is situated at an altitude of 15,970 ft. above sea-level on the opposite side of a broad glacial valley from Mount Kacaca. The country rock is similar in character to that of the other mines in the district, but the ore deposits are lenticular veins parallel to the formation and with richer content than at Milluni. These veins range up to 25 ft. in width. Cross-veins also occur, cutting the formation, but they are of minor importance. The adit shown in Fig. 3 cuts the Carmen and Aliaga veins, which strike S.60°E. and dip 45°SW. Their fillings are similar to those at Milluni, save that bismuth minerals—bismuthinite, native bismuth, and bismite—are found. On top of the hill back of the adit is the Aurora tin-bismuth vein, parallel to the slate formation, which there strikes north-south and dips 72°W. This vein contains slate, quartz, pyrite, arsenopyrite, cassiterite, chalcopyrite, hematite, galenite, sphalerite, molybdenite, bismuthinite, native bismuth, and bismite.

Continuing his journey onward across the hill into the neighborhood of the ancient Spanish Huayna Potosí silver mine, the visitor comes to the Santa Rosa tin-bismuth vein, not shown here. This is at a contact between slate and quartzite strata, striking N.45°W. and dipping 75°NE. The minerals are the same as those in the Aurora vein. For 20 ft. from the vein little lenses of bismuth minerals occur between the slate laminae. The wages paid at the Huayna Potosí mine are as follows: Miners, $1 to $1.20; laborers, $0.60; boys, $0.40; women, $0.40 to $0.48. The women and boys are mainly employed on the surface, sorting ore. The ore from the Aurora and Santa Rosa veins

is picked for bismuth, and some shipping tin ore is also produced by hand picking.

The Huayna Potosí mill is 3½ miles north down the glacial valley, at an elevation of 15,080 ft. An aerial tramway carries the ore from the mine to a bin at the bottom of the valley, whence a surface tram takes it to the mill. The cars run down by gravity and are hauled back by mules. The mill is shown in Fig. 4. It is similar in most respects to that at Milluni, the principal difference being in the method of treating pyritic middling from the tables. This is roasted, ground, and concentrated on a magnetic separator instead of on Wilfley tables.

Costs and Profits

I took 21 samples at random from the four mines described above. These samples had a metallic tin content ranging from 0.26 to 21.40% and averaging 3%. Taking this figure for the tin content of the ores of the Milluni district, and assuming the loss in milling to be 33⅓%, the recovery from the ore is about 2% tin. Since the tin content of the concentrate or *barrilla* produced is usually under 65%, the average concentration is about 32 into 1. The cost of mining and milling at the Huayna Potosí and Milluni mines one month was $3.43 per long ton, divided as follows:

Management	$0.52
General expenses	0.26
Labor	2.22
Explosives	0.05
Steel and iron	0.04
Combustibles	0.03
Stores (mainly for mills)	0.09
Freight (to and from Alto station)	0.22
Total	$3.43

This cost was said to be somewhat below the average, and $4 per long ton is probably a better figure.

With Straits tin at £186 10s. in London, the tin in a long ton of 64% concentrate is worth about $580. The total charges for export taxes, commissions, freight, and smelting amounted to $140 per ton. The net value at the railroad was therefore $440. It cost $128 to mine, mill, and ship to the railroad the ton of 64% concentrate representing 32 tons of tin ore. Deducting this from $440, we have $312 as the net value of a long ton of tin concentrate, equivalent to nearly $10 per ton of original ore. The costs of mining and milling at the smaller properties are higher, and their owners are unable to obtain as good prices for their product. Thus a shipment from the Kala Uyu mine, at about the same time as that from Huayna Potosí and Milluni noted above, costs $200 per ton instead of $140, for the reason assigned.

Gold production of Dutch Guiana, South America, totaled 918,594 grams (31,495 oz.) in 1914, against 858,455 gm. (24,933 oz.) in 1913. Two small mills of the Chilean type and two small dredges operated during the year.

English Production of Cyanides

*Cyanides of potassium and sodium are produced in large quantities in the United Kingdom, but the production of cyanide of sodium is largely outstripping that of cyanide of potassium, owing, it is stated, to the fact that the former can be more economically produced than the latter. The comparative prices of the two cyanides during the first six months of 1914 and on February 12, 1915, were as follows: Cyanide of sodium, first six months 1914, 14c. per pound; February 12, 1915, 17c. per pound. Cyanide of potassium, first six months 1914, 15c. per pound; February 12, 1915, 30 to 36c. per pound. The greater relative increase in the price of cyanide of potassium is accounted for by the increased cost of potash. Carbonate of potash during the first six months of 1914 sold at $68 per ton, whereas the current price is $170.23 per ton.

The returns of the British Board of Trade do not distinguish separately the quantities and values of potassium cyanide and sodium cyanide exported from the United Kingdom, the two cyanides being combined in the returns. In 1913 the quantities and values of the salts exported were as follows, the countries of destination being indicated (hundredweight = 112 lb.):

Destination.	Hundredweight.	Value.
Portuguese East Africa	13,058	$257,053
Japan	7,680	127,712
United States	3,283	59,946
Mexico	14,300	287,785
Brazil	3,257	63,459
Other foreign countries	7,985	137,829
Total foreign countries	49,563	$933,784
Transvaal	27,765	557,482
British India	3,797	76,827
Australia	33,348	681,485
New Zealand	6,375	130,281
Canada	8,147	132,383
Other British possessions	11,477	223,854
Total British possessions	90,909	$1,802,313
Grand total	140,472	$2,736,097

There are no imports of cyanide into the United Kingdom.

From the American consul at Glasgow it has been ascertained that the largest individual cyanide factory in the world is in that city, and is now being worked at its full capacity. It is furnishing the requirements of the Transvaal and also makes occasional shipments to the United States. The manager of the company states that since January 1, 1915, the value of the shipments to the United States has amounted to $7715. The same company has exported in the past to Mexico, but at present that country is not importing. It was also stated that Great Britain was able to supply all British requirements and to export to other countries, as an ample supply of raw materials is available.

---

*Report of consul general Robert P. Skinner, London, February 17.

Safety, Sanitation, and Welfare in the United States Steel Corporation Exhibit

By ARTHUR A. WILLOUGHBY

The work undertaken by the United States Steel Corporation in the matter of the physical, moral, and social welfare of its employees is generally considered as model practice and has been widely copied by various industrial enterprises. The high standard attained by the Corporation in its eight years of work along these lines is further advanced in point of organization and results obtained than in Germany where similar methods have been in vogue for the past thirty years. A large portion of the exhibit space occupied by the subsidiary companies of the Corporation in the Palace of Mines and Metallurgy at the Panama-Pacific International Exposition is given over to a portrayal of the work of the Bureau of Safety, Sanitation, and Welfare by means of charts, models, safety devices, and moving pictures. Charles L. Close has been at the head of the Bureau since its inception, and under his direction large appropriations have been made to carry out a system of work that has no equal in industrial history. Mr. Close has been affiliated with the iron and steel industry for twenty-one years, commencing as an ordinary laborer in a seamless tubing plant and later working up to the superintendency of a plant employing 750 men. The success attained by the Bureau under his supervision has been phenomenal.

ENTRANCE TO MINE AT No. 6 PLANT; STEEL FAN AND CONCRETE SUBSTATION.

Briefly stated, some of the accomplishments of the Bureau are as follows: Sanitation work was begun in 1911, and much valuable work has since been effected. The voluntary accident plan went into effect May 1, 1910, before any of the states had put workmen's compensation laws into effect. The vegetable and flower garden idea was taken up in 1911 and has been the means of beautifying the yards and homes of thousands of employees. In 1910 the first playground was built near Pittsburgh at the Pennsylvania works in a congested district. The district nurse plan was inaugurated in 1913 and five practical housekeeping centres have already been fitted up. The number of employees of the subsidiary companies of the Corporation is estimated in round numbers at 225,000, and those dependent on these makes a total of probably a million human beings coming within the scope of the Bureau.

Bureau Operations

Prior to 1906 the various companies had endeavored to do accident prevention and safety work along their own lines with varying success. In an attempt to systemize and standardize the work, a meeting was held in May 1906, participated in by the casualty managers of the various companies, and a committee of safety of the United States Steel Corporation was formed. The original membership of the committee was six, and was later increased to eight, an officer of the Corporation acting as chairman and the other members representatives from the subsidiary companies. The first work undertaken by the committee was that of inspecting the various plants and works with the idea of reducing the accidents and safeguarding the workmen in every way possible. The inspectors were given wide latitude in reporting every place where improvement might be made. The work of this committee led to the organization now in force. The Bureau acts as the central clearing house for all operations. Affiliated with it are the safety and sanitation committees of the Corporation. Branching out from these are the Central committees of the subsidiary companies. The work is further subdivided into

the plant committee on safety and sanitation, the department and special committees, and the workmen's committees. The importance of the committee work is noted when it is learned that 7399 workmen served at various times during 1913 in this capacity on the workmen's committee. No figures on the work during 1914 will be available for several months. Mr. Close gives his entire time to superintending the operations of the Bureau, and has personally supervised the installation of the exhibit made by his department. The moving pictures of the work accomplished by the Bureau, and shown for the first time in the fire-proof theatre installed in the exhibit, will prove of especial interest and will be shown daily throughout the Exposition.

MAN CAGE LOADED WITH MEN, NO. 5 SLOPE, MUSCODA DIVISION.

The Bureau carries on the administrative work of the various committees, distributes to the subsidiary companies comparative statements of accident prevention in the various plants and works so that mutual benefit may result, superintends the installation of the various enterprises looking to the betterment of the workmen's physical, moral, and social being, and is on the alert to gather new information on all matters of interest in its work. The central committee is composed of important officials from each of the plants or mining divisions and holds meetings periodically at the Corporation offices in New York city. The plant committee is made up of superintendents, assistant superintendents, master mechanics, and safety inspectors. Regular meetings are held. Each department of a plant has a committee of foremen who make inspections and look after the installation of safety devices. This committee conducts investigations of all serious accidents occurring in the plant and sends its findings, together with any suggestions, to the Bureau. Each plant manager is held as responsible for the safe operation of his plant and the health of his employees as he is for the successful carrying on of regular work. This is one of the important features of the Bureau's work. The workmen's committee usually consists of three members taken from the rank and file of the workmen. The committeemen are allowed sufficient time to make inspections as often as is necessary on full pay. Their special duties are to look for defects in buildings or equipment, careless practices of workmen, and to suggest improvements. The membership of this committee is changed periodically so that each workman may serve at some time or other. The intent of this feature of the work is to bring the employees into close touch with the workings of the Bureau and to secure active co-operation with it at all times, even when not serving on the committee.

The success of the work has become so well known that it is now being taken up by some of the technical schools and incorporated into courses. It is only a question of a short time until it will be recognized as a regular part of the curriculum, and the technically trained man of the future, on graduating will have studied in his school work one of the vital features of the modern industrial world.

Statistics

The figures which have been compiled with reference to accidents to workmen and the causes and the best methods for prevention, are illuminating. These statistics have largely determined the trend of the Bureau's activities and the form the accident prevention work must assume to secure maximum results. The general

classification of the causes of accidents in the various lines of industry represented in the Corporation's activities, is as follows: hand labor, 43.88%; railroads, 4.22%; mines, 15.10%; machinery, 5.20%; burns, 6.94%; falls, 7.73%; and all other causes, 16.93%. Of accidents ascribed to iron and coal mining operations the causes are grouped as follows: haulage or skip track, 35.23%; fall of slate, rock, ore, or coal from roof, 26.62%; fall of slate, rock, ore, or coal from side, 16.76%; slides or cave-ins, 6.95%; steam-shovel in open-pit work, 4.11%; livestock, 2.25%; chutes and rises, 0.99%; fall of slate, rock, ore, or coal from face, 0.93%; gas and smoke, explosions, and burns, 0.73%; cage accidents, 53%; premature explosions, 0.47%; shaft, 1.06%; delayed blasts, 0.26%; and fall of slate, rock, ore, or coal in blasting, 3.11 per cent.

The figures given relative to the decrease in accidents since 1906 are of great interest as showing what intelligent effort coupled with scientific organization can accomplish. Those saved from serious injury, including all fatal accidents, all permanent injuries, loss to member or portion of member of body, loss of an eye or disabled more than 35 days, during the period from 1906 to the close of 1913 were 11,074. In 1907 the number saved was 532, or a decrease over 1906 of 10.40%; in 1908 the decrease over 1906 was 783, or 18.21%; in 1909 it was 1236, or 25.28%; in 1910, 2215, or 43.4%; in 1911, 2012, or 41.26%; in 1912, 2023, or 36.06%; and in 1913, 2273, or 38.29%. The slight increase noted in 1911 is due to a change adopted in the reporting of serious accidents, a standard system having been installed for all the companies to follow. The percentage of increase over 1906 in payments to injured workmen is as follows: in 1907, 504%; 1908, 91.9%; 1909, 95.6%; 1910, 248%; 1911, 280.6%; 1912, 308.1%; and 1913, 373.1 per cent.

During 1911, 2012 workmen were saved from serious accidents. The total casualty expense was $2,071,407.54. At the 1906 rate of accidents, the casualty expense would have been $3,516,522, a saving of $1,445,144.46. In 1912, the number saved was 2023 and the total casualty expense, $2,587,516.18. At the 1906 rate, the expense would have been $4,033,616, a saving of $1,446,099.82. There were 2273 saved in 1913, and the casualty expense was $3,013,638.12; at the 1906 rate, the expense would have been $4,898,086.48, a saving of $1,884,448.36. The expenditures for safety in 1911 were $747,469.27; in 1912 they were $595,649.18; and in 1913, $660,593.84, a total of $2,003,712.29. The total men saved from serious injuries in the three years numbered 6038, the gross saving in casualty expenses was $4,775,692.64; this, less the expenditures for safety, leaves a net saving in casualty expense of $2,771,980.35.

A résumé of the operations for 1913 shows that the investigation of water supply sources and the installation of improved drinking water systems cost alone $130,000. The common drinking cup around the mines and plants has been practically abolished through the extensive use of sanitary drinking fountains. The expenditures for the betterment of employees were as follows: accident relief, $3,013,638.12; accident prevention, $660,593.84; sanitation and welfare work, $1,600,242.69; pension fund for superannuated employees, $966,194.68; employees' stock subscription plan, $1,000,000; making a total of $7,240,669.33 expended for improving the conditions of the workmen during that year alone. During 1912 the total expenditure was $6,166,364.82. The figures for 1914, when available, will make interesting reading.

Accident Prevention

The safety work has been divided into three branches as follows: organization, safeguarding, and education. Organization is the most important and the preliminary step in effective safety work, a proper spirit of harmony being necessary between employer and employee to obtain beneficial results. The Corporation has expended through the Bureau, since 1906, approximately $5,000,000 in safety work and has practically eliminated the principal causes of accidents for which the employer might be held responsible.

Carelessness on the part of workmen has been responsible for the majority of accidents, and a vigorous educational campaign has been adopted toward helping to bring the workman to a proper realization of his part in the work. Numerous lectures are given at the mines and plants in an attractive way. Typical safe and unsafe practices are shown. Motion pictures and stereopticon views play an important part in this work. Cash prizes and bonuses are awarded to superintendents and foremen for good records in safety promotion, and accident prevention Safety mottoes are used in large calendars, bottoms of drinking cups, on watch fobs, lead pencils, cigars, and on pay envelopes. Conspicuous warning signs are used at all danger points. Rule books are furnished the workmen, and in some plants, where the work is extra hazardous, they are required to pass an examination on the rules. Many pictures are shown in the exhibit which illustrate dangerous practices indulged in by workmen and which the Bureau is endeavoring to eradicate by educational work. At the blast-furnaces, platforms equipped with hand rails and tow-boards have been installed at working points. All hot metal mixers are provided with an automatic device which prevents them being tipped over accidentally. Refuge platforms and safety cages are also used.

While many safety devices are used for work underground, yet a strict observance of rules and safety regulations by workmen is more necessary than the use of a few devices. Dangerous mining conditions are less foolproof, with a few exceptions, than any other industry. Some of the more important rules embodied in underground practice are as follows:

Loose or soft ground must be trimmed down at all times, particularly after a blast.

Nails and spikes must be removed from all boards after staging and platforms have been taken down.

Miners are forbidden to ride on trains where mechanical or electrical power is used.

When more than one motor is used in the entry in tramming to the main shaft, colored lights automatically operated must be installed at cross-cuts where the motor is operating.

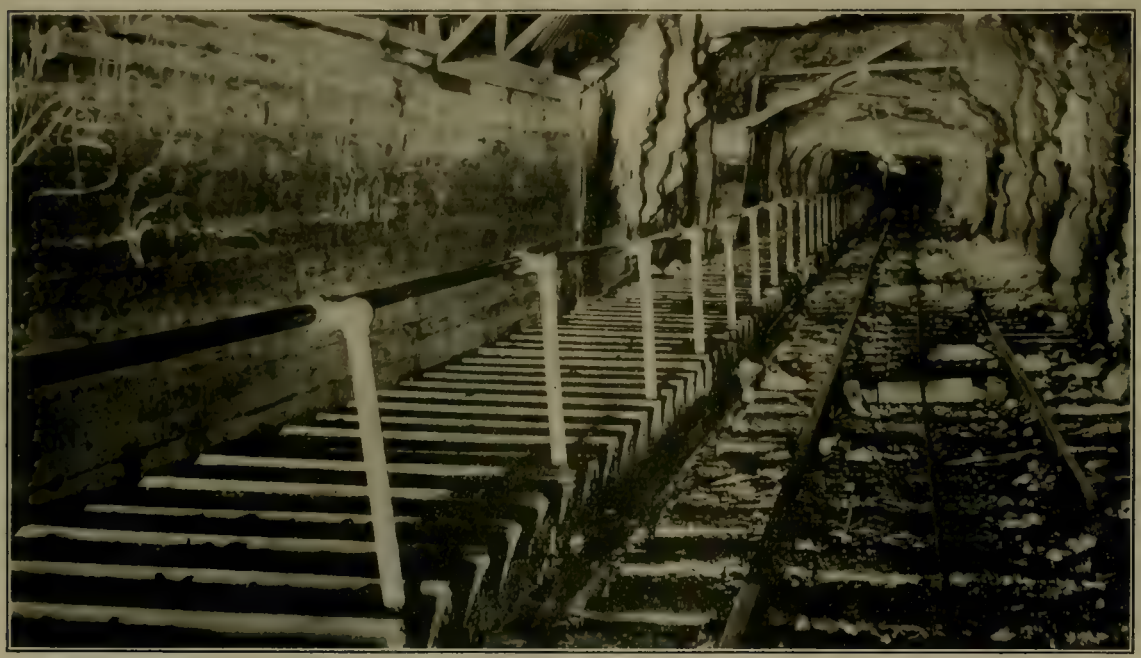
Riding on skips is strictly forbidden. Man cages equipped with arm catchers are provided for raising and lowering workmen in the shaft.

Frequent inspections must be made of the hoisting apparatus.

Extra precautions must be used when hoisting workmen.

No man is allowed to stay underground alone and the shift boss must be the last man to leave.

Extra care must be used during blasting operations. Misfired holes shall be reported in all cases to the shift boss or foreman. Workmen engaged in blasting must have an extra light placed at a safe distance in either direction, and no workman is permitted to blast a hole without having an assistant present.



MANWAY AT EDGEWATER COAL MINE.

All the mining companies have 'first-aid' and rescue crews composed of employees especially trained for the work and provided with a complete equipment of helmets, storage battery lights, oxygen breathing apparatus, and stretchers. Crews are made up of from four to eight men who must first pass a physical examination. They are trained for the work by the Company doctor and special instructors by means of lectures, demonstrations, and drills. A number of crews are assigned to duty at each mine. Emergency hospitals are placed convenient to surface and underground operations. A fully equipped rescue car is operated by the Tennessee Coal, Iron & Railroad Company.

A portion of the exhibit is a standard mine cage used by the Oliver Iron Mining Co. for hoisting workmen in a vertical shaft and for handling cars. It is equipped with safety dogs which engage a wooden rail. The cage is completely enclosed with steel doors which prevent the occupants of the cage from putting out their arms and getting struck by shaft sets. The top of the cage is of heavy sheet steel with hinges for the handling of long mine timbers. The cage is officially tested once a month. In the H. C. Frick exhibit is seen a modern steel headframe and hoist and a concrete lined shaft collar. At the top of the shaft are shown safety devices which prevent the opening of the gates at the surface landing until the cage is in the proper position at the landing. A Safety First sign with the wording in seven languages is shown in a box electrically illuminated and fastened to the head-frame. A circular steel shelter house for the use of workmen in surface blasting operations is shown, as used in the Canisteo district at Coleraine, Minnesota. It is a model of a house 8 ft. diameter and 9 ft. 2 in. high and built of ⅛-in. sheet steel. A safety hoisting bucket equipped with a latched cover is of interest as well as a black powder charging shield for use in charging vertical holes. The Schindler device, which has been adopted by the Corporation as the standard danger signal, is displayed. This consists of a rod with a red revolving disc and a white arrow. The disc can be set with the arrow pointing in any desired direction. Numerous signs such as are used in actual practice are shown. One which is used in conspicuous places about mine shaft stations reads as follows: "Do not try to move skip unless you know why skip was stopped." A safe method of attaching the hoisting cable to a skip car is shown. Many photographs and charts are displayed

about the walls of the exhibit space which are of interest and which give some idea of the scope of the work of the Bureau. An automatic projecting device shows a series of views on a ground-glass screen.

On $5,000,000 which has been spent on accident prevention work, the tangible returns during 1911-12-13 were $2,771,800.35 besides educating the workmen to a higher sense of the necessity of their co-operation to make the work of the Bureau successful and laying the groundwork for future growth, so that the money has been well expended. The average saving by the Bureau's methods in accident prevention will reach a million dollars each year.

Welfare and Sanitation Work

This work is especially important from the fact that the average foreign laborer lives on a much lower scale in this country than he would in his own country. He ordinarily immigrates with the idea that this is a land of golden opportunity and that it is an easy matter to get enough saved up in a few years to retire on and go back to the old country, and he will scrimp in order to hasten the glad day. As a result he pays but little or no attention to his living conditions. The efforts of the Bureau to secure better housing conditions for the workmen and to arouse them to a sense of their home duties have been eminently successful. Several model industrial centres have already been built and have attracted a great deal of attention. Three models are shown which are illustrative of the attempt of the Corporation to secure better surroundings for the employee in his home life. The models are mounted on mahogany pedestals and are surrounded with glass cases. The coloring and reproduction of the foliage, contour lines, and general appearance show careful attention to details. One is of a model construction camp on the site of Bayview, Alabama, which is being built as a new type of mining town. The camp is intended to embody the latest ideas of sanitation and housing in a tent city, in every way and to mark a radical departure from customary construction camp conditions. The following problems were considered; drinking water supply, sanitary work, and camp cleanness, eating quarters, sleeping apartments, bath-house, and hospital.

For the water supply two wells 75 ft. deep were drilled, cased with iron pipe, equipped with iron pumps, and covered over with concrete. In making the camp a model one from a sanitary standpoint, the site was cleared of all brush, stumps, and old logs and the trash and leaves burned. Waste water of all kinds is carried away by suitable drains to a convenient cesspool. To prevent the pollution of the soil and the consequent spread of disease, sanitary dry closets of the can receptacle type were installed, provided with a galvanized iron can and a fly-proof box seat. The closets are placed at frequent intervals, convenient to the sleeping quarters and the scene of work operations. The dining hall and kitchen is a one-story structure. The sleeping quarters consists of 'A' shaped tents set up on the higher grounds of the site and arranged in parallel rows near the work. The bath-house is equipped with hot and cold showers. Adequate hospital and medical service is provided.

Another model shows Bayview as it will appear when completed. It will be a self-contained community in two districts; one for the whites and one for the negroes, and separated by the railroad which runs through the town. The streets are laid out to conform to the natural contours of the site and are curving. The building line is set back 20 ft., and the houses, which are of frame construction, are of the 2, 3, 4, and 5-room type. The houses are not placed in type groups, but each one is arranged with respect to the topography of the lot on which it is to be built. There is a bath-house for all employees and a special one for the women and children built near the centre of population. The negro section is similar in treatment in many respects to the white section. When completed it will be the model mining town of the United States, if not of the world, and the model on display should receive a great deal of attention.

The finest industrial town in the world will probably be realized when Morgan Park, Minnesota, is completed, a model of which is shown in the exhibit. The town is being built to house the employees of the steel plant there. Owing to the severe climatic changes during the year, the winters being long and cold, a great many problems were met with not encountered at Bayview and other points. The neat appearance of the streets and alleys will command favorable attention. Special attention has been given to the housing conditions. Families are placed by themselves and no families keep roomers, provisions being made to accommodate the single workmen. The morals of the young women and girls, which are at a low level in some industrial centres, are thus safeguarded. The houses are equipped with electric lights and water and supplied at low rentals.

The type of bath-houses built by the Corporation is of special interest and a large sized model is shown in the H. C. Frick exhibit. It has a glass roof so that the interior appointments may be easily viewed. It is equipped with shower baths and lavatories of a neat and substantial pattern. An interesting feature is a device by means of which a workman may hoist his wearing apparel out of harm's way while he is performing his ablutions, thus preventing the liability of theft.

Voluntary Accident Relief

This plan which went into effect in 1910 provides compensation for all employees injured or killed in service, and for their families. Relief is paid without legal proceedings and medical treatment is provided by Company surgeons and hospitals. The relief plan covers temporary disability for single and married men, the latter being favored with a higher rate; fixed and stated amounts for permanent disability which are based on the wages of the injured workman and the nature of his injuries; for permanent total disability an amount which will make suitable provision for the injured party,

and in no case less than the death relief; in case of death, the funeral expenses, not exceeding $100, and fixed and stated amounts based on the workman's earnings, the length of his service and the size of his family, with a maximum of $3000. Since this plan went into effect, the Bureau plan of relief is superseded by the provisions of those laws.

Vegetable and Flower Gardens

One of the most successful plans evolved and coming within the scope of the Bureau has been that of encouraging the employees and their families to beautify their homes and yards and incidentally help to reduce the high cost of living. Community gardening was begun at Ambridge, Pennsylvania, on the Monongahela river near Pittsburgh, on vacant land owned by the American Bridge Co. Other points where this plan is being followed are: Cuyahoga Falls, near Cleveland; Elmira, New York; Elwood, Pennsylvania; Morgantown, West Virginia; Johnstown, Pennsylvania; and Lorain, Ohio. In 1910, 270 pieces of unoccupied land were turned over to employees for gardening purposes. One 25-acre plot was divided into 240 plots and many peoples were represented among the gardeners. By this method the employee is given wholesome work to do during his leisure hours that discourages loafing.

The H. C. Frick company offers prizes each year to employees for the best vegetable and flower gardens. The sales made by one supply company showed a remarkable increase in 1913 over 1912 in potted flowering plants, flower seeds, cabbage and tomato plants, onion sets, and vegetable seeds. During 1913 there were 6296 cultivated gardens, being 91% of the total number which could have been planted. During 1914 this percentage was increased to 93. The estimated average value of each garden was placed at $27.50, meaning a saving of $173,140 in the living expenses of the employees of that Company alone. There were awarded by this Company, in 1913, 113 first prizes, 113 second, and 79 third. Many photographs of these gardens are displayed in the exhibit.

Playgrounds

The playground idea has grown into a great enterprise since the first one was built in 1910. It was installed in a badly congested district, closely surrounded by blast-furnaces and railroad car-tracks. Many accidents occurred daily in the vicinity. The playground succeeded in reducing the accidents to almost *nil* and afforded the children of the neighborhod a place to play without fear of danger. In 1913 there were 101 playgrounds, with an average daily attendance of 8688 children. In 1914 the number was increased to 128, and the average daily attendance increased to 16,619, almost double the previous figures. Playgrounds have been installed in 65 Pennsylvania mining towns.

Swimming pools have been constructed in three towns; to these everyone, employees and otherwise, has free access. At McKeesport, Pennsylvania, at the junction of the Monongahela and Youghiogheny rivers, drowning accidents were numerous. Since the building of the large swimming pool and affording of competent instruction, there have been practically no drownings. The moving pictures show some very interesting views of this pool. A model of a playground is exhibited and shows flying rings, swings, seesaws, merry-go-rounds, horizontal bars, slides, and volley ball courts. A large rest tent with cots is set up. There is a miniature theatre, with a glass roof to give a clear view of the interior, which is equipped with a stage and motion-picture outfit. The playground idea for the male grown-ups has taken the form of clubhouses containing dormitories, reading-rooms and libraries, gymnasiums and swimming pools, billiard rooms, bowling alleys, basketball courts, and moving-picture theatres. Concerts are given by the musical societies organized among the employees. Athletic clubs are encouraged. Various educational features, such as study courses and lectures, are provided.

District Nurses

This plan was begun in 1913 and is generally followed by the mining companies and in industrial districts. The nurses are to keep in touch with the employees' families and to give their services wherever necessary. A number of headquarters have been fitted up, at an average expense of $269 each, in West Virginia, Pennsylvania, and Alabama mining districts. One at Duquesne, Pennsylvania, is in an industrial section and has been unusually successful. Sewing and cooking classes, even to instruction in the making of beds and proper ventilation, have been formed among the women and the headquarters have been made practical housekeeping centres. Economical purchasing of household supplies is taught, and every assistance rendered to make ideal housekeepers of the women. The houses selected as headquarters are of the type used by the employees, and the intent is to show a neat, simple, yet inexpensive way of fitting up a home. More than 100 girls are enrolled in the various classes and instructed in the care of babies, first principles of household sanitation, hygiene, cleanliness, household service, and in cooking, darning, washing, and cleaning. The nurses also look after cases of sickness coming to their notice. Their services are a most valuable feature of the welfare work of the Bureau, and this feature is being extended as fast as possible to other sections.

The general exhibit of the Corporation is in charge of A. T. DeForrest, of San Francisco, as general chairman, and H. V. Jamison, of Pittsburgh, as director-in-chief. The installation of the H. C. Frick and allied coal exhibits was made by Thomas W. Dawson, of Scottdale, Pennsylvania, assistant chief engineer of the Frick company.

Coal produced and handled direct by the Pittsburgh Coal Co.'s subsidiary companies in 1914 amounted to 18,295,851 tons, a decrease of 6,411,353 tons.

Opportunity for Workmen at Anaconda

*The officers of the Anaconda Copper Mining Co. knew that the men at Anaconda wanted an opportunity to have little farms, because every available patch of land close to the city was utilized, and men with horses were getting little places, some as far as nine and ten miles from the smelter, and driving in and out to their work. The Company also knew that about six miles from town was several thousand acres of land, some of it so swampy that it afforded merely a nesting place for wild ducks and a home for muskrats. The remainder was so wet that it supported only an indifferent type of agriculture. Here was an opportunity to create, and it appealed strongly to the imagination of the officers of the Company. Constructive effort has converted this swamp into a garden spot. To the worker it spelled opportunity, and Opportunity is the name of the suburb that has been built there.

BUTTE, MONTANA.

First, the land had to be drained, and the most approved trenching machinery was secured. Water was encountered in such quantities that the first three weeks' work found 350 ft. of ditch dug, and the tile which had been laid was full of sand. Finally a machine was constructed which surmounted the difficulty.

Next came the tillage. The first attempt to plow the land was made with horses, but was unsuccessful. Powerful traction engines were then secured, but the most approved would not do the work. A machine for the purpose was therefore designed. Essentially it is the counterpart of a threshing machine cylinder, only the cylinder weighs 1600 lb. and is armed with steel knives which, rotating rapidly, cut and tear up the tough sedge, wire grass, and peat sod. This is followed by burning, and the land is then plowed in the ordinary way.

For the development of this community a block of several thousand acres of land was prepared. The general plan contemplated a community centre embracing a 65-acre park, with a modern school and school gardens in the middle; the division of the unit into ten-acre tracts, all of which have been thoroughly tile-drained and supplied with an equally efficient irrigation system. Transportation facilities have been provided between the town of Opportunity and the smelter, and the car line is so situated that 300 tracts are available, none farther than 1¼ miles from the line. Every tract has a frontage on a 60-ft. street, and each tract is 1000 ft. long and 435.6 ft. wide. The principal roads are being macadamized, and a nursery has been started to provide trees for planting on all the streets.

Of a ten-acre tract, three or four acres are devoted to oats and barley, a similar area to hay with a pasture lot of an acre, and an acre for house, garden, and small orchard. Thus nothing need be bought to feed a horse, cow, some pigs, and chickens. In this way ten acres is completely utilized, while a larger area would assume rather the character of a farm than that of a suburban home for people having outside employment.

Three mountain trout streams cross this garden spot. They are part of the park system and will remain undisturbed for the enjoyment and benefit of all alike. The land when purchased is ready for a crop. To the purchaser who pays for his land outright, means are offered for a loan to cover the cost of improvements. In addition to this, the Company is furnishing, from its large lumbering mills in western Montana, lumber and millwork at cost to the home builder. Monthly payments covering a reasonable period have been arranged for, so that the purchase of the property amounts to little more than rent. Such a plan encourages thrift in the community. To protect the family of a workman who may die before completing his payments, the Company has provided what is essentially an insurance clause, so that a clear title to the tract passes at once to the widow without further payment. Naturally this privilege can not be transferred by sale.

The Company has established a livestock and grain farm adjacent to Opportunity. On this farm provision has been made to supply at reasonable prices tested seed of both grains and grasses of the varieties best adapted to the locality. It is not expected that dairy farmers will be made of all the occupants of these tracts, but it is hoped that ultimately every individual will own a pure-bred Holstein cow, so that when a heifer calf is raised a return of from $150 to $250 can be secured as against a return of $35 to $40 for a grade animal. The new owners are of many nationalities—Servian, Austrian, German, English, French, Irish, and Scotch. Their agricultural experiences are varied; some have had none. The land was placed on the market in June of last year, and already two-thirds of that offered has been purchased.

*Revised from an article by Richard Wardling in *Leslie's Weekly*.

CORUNDUM ORE (uncleaned) amounting to from 100 to 200 tons per year has been produced in the state of Mysore, India.

Platinum Analysis

By F. MYLIUS and A. MAZZUCCHELLI

*A pure platinum solution was prepared by recrystallization as Na_2PtCl_6 from a weak Na_2CO_3 solution; finally by dehydrating at 120°, dissolving in absolute ethyl alcohol, filtering off the NaCl, and precipitating with about 15% H_2O; the metal is then obtained either by reduction with H or with N_2H_4 in HCl solution. The qualitative reactions with 14 different reagents of solutions of Pd, Rh, Pt, Ir, Ru, and Os as chlorides, each containing 1 gm. per l., were determined, and the results are given in tabular form; one of the most characteristic properties of such solutions is the color; Pt being pale yellow, Pd pale brownish yellow, Rh rose red, Os golden yellow, Ru brown, Ir brown; the intensities of the colors increase from Pt to Ir. Rh can be determined colorimetrically in strong HCl solutions when fairly pure; the Ir content of Pt can be determined fairly well in the same manner, due to the great intensity of its color; dissolve 0.01 gm. in aqua regia, evaporate with HCl, dilute with concentrated HCl to 100 c.c., compare with standard Pt and Ir solutions. The properties of several platinum metals were studied from the analytical point of view; a characteristic of the group is the tendency of one metal to interfere with the reactions of another when present. The characteristic violet coloration of Ru salts with KCNS is affected by other platinum metals; Ru is carried down when Pd is precipitated with $Hg(CN)_2$, though by itself Ru is not precipitated by this reagent; Ru also hinders the reduction of Pt salts by N_2H_4. The best separation from Pt is by precipitation as IrO_2 from $IrCl_4$ solutions by NaOH, but this precipitation requires the presence of an oxidizing agent to prevent reduction to $IrCl_3$, which is not precipitated; NaClO or NaBrO is recommended. For the best results the solution should be but slightly alkaline; under these conditions most of the other metals are precipitated with but little contamination by Pt. Pt in Ir can be detected by the reaction with KI, the dark-brown Ir solution being colored yellow, while the yellow Pt solution is colored brown; by comparing with standard solutions 1 part of Pt in 100 Ir can be determined by this reaction. The characteristic reaction of Pd with $Hg(CN)_2$ is not sufficiently sensitive in the presence of other Pt metals, making it advisable to separate the others with NH_4Cl, leaving the Pd in solution as $PdCl_2$; dimethylglyoxime also is less applicable in the presence of other Pt metals. Pd reacts much more quickly than the other Pt metals, *e.g.*, its alloys are violently acted on by aqua regia, and it is instantly precipitated by H_2S; the latter fact can be utilized in its separation. EtSH in 1% H_2O solution gives a yellow coloration with Pd solutions containing 1 part in a million, and on warming a dark yellow flocculent precipitant separates; the reaction can be used to separate Pd and Ir, as the latter is but slowly precipitated. Ru has no reactions which permit its precipitation from the other Pt metals; it is best concentrated in the filtrate by rapid precipitation with H_2S, and subsequent precipitation with H_2S on boiling, reduction to metal, and separation from Ir by fusion with $KHSO_4$. Ru, like Pd, is precipitated cold by H_2S, but the precipitation is not complete, due to reduction; the formation of a blue coloration is characteristic; from Pt alone Ru can be separated by the NaClO method given above, but in the presence of Ir, Ru and Ir oxides carry down some Pt. The following scheme is given for the qualitative detection of Pd, Pt, Ir, Rh, Ru, Au, Ag, Cu, Fe, when 1 mg. of each is present in a chloride solution:

Evap. to dryness, take up with 2 c.c. H_2O, filter.

Sat. filtrate with NH_4Cl; after 1 hr. filter and wash with a little NH_4Cl soln.	Ppt. AgCl; dissolve in NH_4OH, add insol. residue to ppt. I, reppt. AgCl with HNO_3.
Evap. filtrate to dryness with 3 c.c. dil. HNO_3, take up with a little HNO_3 to form a soln. satd. with NH_4Cl, filter, wash with a very little dil. HNO_3-NH_4Cl mixt.	Ppt. I. Double chlorides of Pt, Ir, Ru. Add insol. residues from other sepns. Ignite to white heat in a current of H, ext. with dil. aqua regia, filter, detect Pt by evapn. with NH_4Cl. Ignite insol. residue in Au or Ag dish with 0.3 gm. $NaNO_3$. Ru dissolves to a yellow colored soln. Ir remains as a blue insol. residue.
Evap. filtrate to dryness with HCl, dissolve in 5 c.c. H_2O acidified with a few drops of HCl, sat. quickly at 18° with H_2S; after 10 min. filter, wash with H_2O.	Ppt. Pd, Ir, Ru as double chlorides. Evap. with HCl, take up with 3 c.c. H_2O, sat. cold with H_2S, filter, dissolve sulphide ppt. in aqua regia, test soln. for Pd with $Hg(CN)_2$. Add insol. residues to ppt. I.
Sat. the hot filtrate with H_2S for 30 min., filter, wash with H_2O.	Ppt. AuS and CuS. Dissolve in dil. aqua regia, evap., dissolve in dil. HCl, ext. with Et_2O, test Et_2O layer for Au with SO_2. Ppt. CuS from aq. layer, wash, ignite, ext. with dil. HNO_3, test for Cu with NH_4OH. Add any insol. residue to ppt. I.
Boil filtrate to remove H_2S, oxidize with HNO_3, precipitate $Fe(OH)_3$ with NH_4OH. Confirm with $K_4Fe(CN)_6$. Filtrate should be all NH_4 salts, wholly volatile on ignition.	Ppt. RhS_2. Dissolve in hot dil. aqua regia, evap. to dryness, take up by warming with conc. HCl. Red soln. indicates Rh; confirm by pptn. with EtSH. Traces of Ir may be in filtrate.

The primary separations are carried out first, then the confirmatory separations made in the reverse order, separating the Pt, Ir, Ru last. Details of some of the processes are given below, in the quantitative analysis.

*Abstracted from *Zeitschrift fur Anorganische Chemie*, January 1914, by George W. Morey in *Chemical Abstracts*.

In quantitative analysis two cases are to be distinguished: *A*, the Pt is so impure that the impurities can be separated directly; *B*, the Pt is so pure that the other metals must be concentrated; the two cases are distinguished by dissolving 0.1 gm. in aqua regia, evaporating to dryness with 0.1 gm. NaCl; take up residue with a little H_2O, add a little (0.02 gm.) Na_2CO_3 and heat to 100°, so that the solution remains slightly alkaline, cool, add 1 to 2 drops NaClO or NaBrO solution, warm; a dark coloration, changing to a bluish black precipitate, indicates case *A*, while in case *B* the solution remains orange yellow. For the analysis, in case *A* take about 10 gm., if an accuracy of about 10% is sufficient in the case of impurities present only in amount of 0.1 to 0.2%, though for more accurate determinations more must be taken; in case *B* take 100 gm. In case *A*, heat 10 gm. at 40° with 10 gm. concentrated HNO_3 and 100 gm. HCl (d. 1.14) in a long-necked quartz flask until violent action ceases, add 20 gm. more HNO_3 and heat the solution; evaporate to dryness in porcelain on the water bath after addition of 6 gm. NaCl, add H_2O and repeat the evaporation until all acid is removed, then heat the impure Na_2PtCl_6 to 120° for 1 hr. Treat the residue with 100 c.c. cold H_2O, filter off the insoluble residue and wash with H_2O; it consists of Au, silicates, Fe salts, AgCl, etc.; convert the metallic salts to chlorides and add to the main solution. Dilute the main solution to 500 c.c., transfer to a Pt dish, add 0.8 gm. $NaHCO_3$, heat to boiling, and cool. Litmus must show a slight alkaline reaction. Without regarding a slight precipitate, add a solution of 0.8 gm. $NaHCO_3$ in 20 c.c. saturated Br water, heat on the water bath until a black flocculent precipitate settles out from the dark-colored solution; the solution now should be but slightly alkaline, since the nearer to neutrality the better the separation. If the above treatment fails to flocculate the precipitate, cool the solution, add a little more NaBrO, after 10 minutes a few c.c. EtOH, and heat the solution to boiling. Filter off the precipitate, test the solution for completeness of precipitation with NaBrO and EtOH as above, and add precipitate to the main one; evaporate the filtrate to dryness with some HCl to destroy the NaBrO; the Na_2PtCl_6 so obtained is to be purified as given in case *B*, though for approximate analyses it is pure enough except for the presence of NaCl. The impurities are determined by a scheme in some respects similar to the above qualitative scheme. Wash the bluish black oxide mixture from the filter (a blue-colored filter can be completely extracted with HCl containing a little N_2H_4, which should be destroyed by evaporation with HNO_3), and evaporate repeatedly with concentrated HCl, with addition near the last of a little HNO_3, until the blue color of the solution has changed to a yellow, dissolve the residue (containing generally less than 0.4 gm. metal) in 6 to 8 c.c. H_2O, add 1 gm. NH_4Cl, filter the precipitated Ir, Pt, and Pd, and wash with very little half-saturated NH_4Cl solution; evaporate the filtrate to dryness with 1 c.c. diluted HNO_3 and treat the residue with the small amount HNO_3 required to dissolve the soluble material, collect the remaining double chlorides on a filter, and wash with a half-saturated NH_4Cl solution until the filtrate is colorless; unite the two precipitates and treat as given below. Evaporate the solution to dryness with HCl to remove HNO_3, dissolve the residue in H_2O, add 2 to 3 drops HCl, and pass in H_2S rapidly for a few seconds until the solution has a strong H_2S odor, filter the CuS and wash with H_2O, ignite in the air, dissolve in dilute HNO_3; the insoluble residue consists of Au and Rh; Au is dissolved by dilute aqua regia, leaving a residue of Rh; small amounts of Cu are best determined colorimetrically. If Rh is present the filtrate will be red; after removing H_2S, Rh can be determined colorimetrically; in large amounts it is isolated by crystallization of $(NH_4)_2RhCl_6$, which is difficultly soluble in saturated NH_4Cl solution; to remove small amounts it is necessary to saturate the hot solution with H_2S, filter, ignite, and weigh as crude Rh, since on fusion with $KHSO_4$ it is not wholly soluble; the complete separation of Rh and Ir is not possible. In the filtrate Fe is precipitated as $Fe(OH)_3$ in the usual manner; the Fe_2O_3 may contain Ir, so the Fe is determined colorimetrically and the residue called Ir, or in more exact work the $Fe(OH)_3$ is dissolved in dilute HCl, $FeCl_3$ extracted with Et_2O. The filtrate from the Fe should be tested for Co and Ni by acidifying and adding $K_4Fe(CN)_6$; if they are present the strongly concentrated filtrate should be made slightly ammoniacal, saturated hot with H_2S, then slightly acidified with HCl; the ignited sulphides are treated with aqua regia to obtain the small amount of Ir they contain. The filtrate should now consist wholly of NH_4 salts, with the exception of a small amount of Na_2SO_4; in case the residue after ignition is not wholly soluble in H_2O it indicates contamination from the containers used, or a little Ir. The double chlorides of Ir, Pt, and Pd obtained above, to which had been added the various Ir residues, are reduced by ignition to a white heat in a current of H, the metallic mass extracted on the water bath, with 1 part aqua regia and 2 parts H_2O, until the residue has fallen to a powder and new portions of the solvent are no longer colored, when the Ir is filtered off. The filtrate is evaporated and a concentrated HCl solution free from HNO_3 prepared from which the Pt, contaminated by a small amount of Ir, is precipitated by NH_4Cl; from the color of the precipitate is determined whether or not the amount of Ir present makes necessary the repetition of the reduction and solution process. Evaporate the filtrate from the Pt, precipitate with H_2S in the cold, and ignite in H to obtain Pd; it can be purified by solution in HNO_3 and precipitated with $Hg(CN)_2$. The total Ir is strongly ignited in H, when it becomes insoluble in aqua regia; the Ru which it probably contains is extracted by heating to a dark red with KNO_3 and KOH in a Au crucible, treating the melt with H_2O, and letting stand until the IrO_2 settles; if the supernatant liquid is blue no Ru is present, while if it is greenish Ru is present. To determine the

amount of Ru, the whole must be dissolved, the treatment with $NaBrO$ repeated, and the Ru volatilized in a Cl stream. In case *B*, the sample is dissolved as above, NaCl added, and the Na_2PtCl_6 permitted by recrystallization from 1% Na_2CO_3 solution, the impurities after removal of 95 to 99% of the Pt are in part concentrated in the mother liquor, in part collected in the filters used for clarifying the 1% Na_2CO_3 solutions (see M. and Foster, *Ber.* 25*a*, 665, 1892). The impurities are collected, dissolved in aqua regia, heated to 150°, and treated as in case *A*.

Robert H. Richards—An Appreciation

By DAVID H. BROWNE

*In the stories of olden time we read of many men whom for one reason or another the King delighted to honor. Grave or gay, statesman or buffoon, lawgiver or licentious companion, each commended himself to royal favor and received his reward. Such honor or preference of one man for another is easy to understand, for their mutual attraction might lie in any taste or inclination common to both. It might be based upon public service or upon private interest, and we find in such recognition no criterion of value or standard of merit. Here and in other countries where democratic ideas prevail, where the King is the people, and merit is recognized by all; here when we meet together to honor one man above his fellows, we try to analyze the grounds of our high appreciation and make plain to ourselves the reason why we do him honor.

We who meet here this evening have given our lives to the science of valuation. As engineers in mining and metallurgy our training and experience and habits of mind have bred in us an instinct of appreciation, for appreciation means simply the just judgment of values. When we examine a mine or a process, we take into account those conditions which give it a value, and we balance one against the other the money value to be paid against the future value to be won. So we must be appreciative of worth in whatever way we find it. We form an instinctive judgment of ethical values which is perhaps of more use to us than a logical process, and as we grow older we are more and more inclined to trust to our instinctive appreciation of what is good, than to our intellectual balance sheets. As we have met here with a common purpose to express our high appreciation of one of our number, we must, as scientific men, ask ourselves what are our reasons for this and what scale we apply to our determination of values.

What is it that brings men together and what are the qualifications we seek in a leader? What makes us distinguish between man and man and point to one as preeminent? It is remarkable that we are drawn together by the possession of certain qualities common to us all and repelled by certain other qualities equally common. "All men are liars," said the Psalmist in his haste, but a liar is in no way attracted to another liar. A company of mean minded men would not be difficult to assemble, and yet their meanness would not insure harmony. There is no continuity in a mob, all unanimous in one evil passion. The deed once done all unity falls into discord, into mutual hatred and recrimination. You cannot bind men together by their vices.

There is in all men a certain agreement, a sense of what is best in nature and in his fellow men. The musician would not make a universal appeal if harmony were not harmony to all. Instinctively the ear recognizes certain sounds as pleasing and others as disagreeable. Instinctively the eye receives certain combinations of color or form as beautiful and rejects others as ugly. So instinctively we feel certain qualities in man to be right and uplifting while others we recognize as wrong and degrading. The perception of good is axiomatic. It cannot be explained. You can explain to a man all about the light waves—you can give him a very accurate idea of their pitch and amplitude and frequency. So that he may know as much about these as we do, but if he is blind you can never give him the perception of light. So you can explain what is good and analyze all that enters into its scope and relations, but the immediate perception thereof is from within. If you have no children of your own you can never fully understand what the word Father means. No explanation of duties and obligations can give you this perception, and yet it is as simple and satisfying as the perception of light.

It is this recognition of the best in ourselves and our fellow men that draws us together. This feeling lends to the formation of fraternities and societies and parties and makes these independent of their founders. The mob endures for a day or an hour and tomorrow the sheriff cannot find it, for it is based on evil. The society endures for generations, for it is based on a universal perception of what is good.

And yet with this appreciation of what is good is bound up the idea that each member of that organization has entire liberty of belief as to the best means to attain that desired end. The mere fact that we disagree with our leader does not in any way weaken our loyalty to him. Very often what attracts us about a man is that we disagree with him. You and I may argue from the same set of facts and reach entirely different conclusions. We have started in the same place, used the same tools, tunneled through the hill in different directions and come out on opposite aspects, and yet I am much more interested in you than I am in a man who believes as I do, but who cannot set forth the reasons for his belief. You have used your faculties as I have, our habits of mind and our methods of procedure are alike. That he and I agree is a mere accident of position, that you and I differ is a result of action, and in life what counts is action and not position. Life is not static, it is dynamic, and the doing means more to us

*A speech delivered before the Mining and Metallurgical Society of America on the occasion of the presentation of the Society's gold medal to Professor Richards.

than what is done. So in leadership of any kind, in pre-eminence in art or science, or any human activity, the leader is one who possesses a habit of mind common to himself and his followers, who reflects in his life and character those qualities which each feels to be the best in himself and who expresses his life in action.

There is another qualification we must not omit, that of humanity. A generation ago our mental attitude was much more tolerant of restraint than it is today. We confined ourselves more readily within the boundaries of formula and dogma than we do now. We subscribed more easily to the tenets of the majority and sunk our individuality in our party or church or creed. Today we are given more to individualism. We can no longer write ourselves down as Democrat or Republican, as Baptist or Presbyterian, as materialist or idealist. Today we realize that all good cannot be expressed in a single formula, and when our knowledge increases, the old forms in which we expressed our beliefs must be broken and be replaced by larger conceptions of truth.

Many of you here have felt that disturbance of mind which comes from seeing some time honored belief pushed aside by a new discovery. No dogma is sacred from investigation. In science itself where we have felt most secure in our belief, where the ground seemed safe beneath our feet, we remember the shock which was given us by the discovery of radium. Even in such a comparatively limited field as the concentration of ores, our conceptions were entirely revolutionized by the process of flotation. These are small matters compared with the revolution that has taken place in our conceptions of life and our relations to the universe.

In all times of mental stress we turn instinctively to certain men for guidance. We see such men holding fast to all that is best in the past and at the same time reaching forward to all that is best in the future. They are not bound by any limited conceptions. They realize that the birth of a new idea does not mean that the old was false, but simply that it was incomplete and imperfect. Such men act as intermediaries, absorbing the best of each generation and passing on the light. The candle our grandfathers passed to our fathers was exchanged for the lamp they passed to us and we pass the electric filament to our children. The medium changes, but the light is always increasing. In all our mental struggles, each one of us has found some man who taught him to see clearly, who handed him the light.

Why is it that the memory of Joseph LeConte is so revered on the Pacific coast today? Do we not realize how he helped us in that period when all our old beliefs and faiths were overset and we knew not where to turn? It was not so much what he did and said as the kind of man he was that helped us. So in Michigan we revere Angell, not for what he taught us so much as for the impression he made on us, and that impression will endure throughout our lives.

When we come here to honor one of our members we are agreed that in him we recognize those faculties that are best in ourselves, those habits of mind that lead us to use our faculties for the general good and that faith in human nature and the future progress of the race which makes us feel that our lives are worth living and our duty worthy of the doing.

We are each interested in the questioning of nature by direct experiment. We know that she does not reveal her secrets and unlock her treasures unless we have the pass key of patient research. We recognize in our friend that tireless energy in the search after facts, that ingrained habit of investigation which characterizes each seeker after truth. Little by little and one by one we gather the materials of our knowledge. But facts alone are fragments forming no concrete whole. We must group them in order, classify and arrange them so that they fall into sequence and form the basis of argument, and the man whom we honor has that happy faculty of arrangement and that sense of order which makes experiment, science and not empiricism. He has shown us how the sequence of fact leads to the discovery of law, and what we call a law is simply our expression of the reasonableness of nature.

But we are all practical men, interested not only in laws of nature, but in their practical application. As soon as we discover how nature does things we wish to apply that knowledge for our material advancement. I need not remind you that our friend has profoundly influenced our mining and our milling practice. This is evident to all. We realize that it is one of his great claims to our high appreciation. While I assent to this as we all assent, I do not think this is his greatest claim.

Man's progress is not altogether material. Those of you whose specialty is organization will understand that men are not machines, each to be speeded up to their individual limit. You know that in planning any mine or mill or smelter, we have to consider each part in relation to the whole—each with a liberal factor of safety, each to be balanced against the other in unity of action. In any organization, what counts is the recognition of the human factor, remembering man's weakness as well as his strength. Success in all things depends upon sympathetic knowledge of human nature.

So if you ask me to define wherein lies that pre-eminence which we meet tonight to honor, I give you my opinion. Untiring zeal in experimentally questioning the facts of nature, ability to marshall those facts in an orderly and logical sequence, imagination and idealism which looks behind the facts and discovers the laws of nature, practical insight into the requirements of industry and application to the industry of those laws in such a way as to further our material progress, and lastly an elemental simplicity and kindness in his relation to his fellow men.

The greatest thing in life is personality. The greatest men are those whose fingers find the chords of life and at whose touch we thrill in sympathy. It is that personal appeal that some men make to our better selves that makes them leaders, and so I place above all other attainments the personality of the man we honor tonight, Robert H. Richards, our mentor and our friend.

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

The Design of Belt Elevators

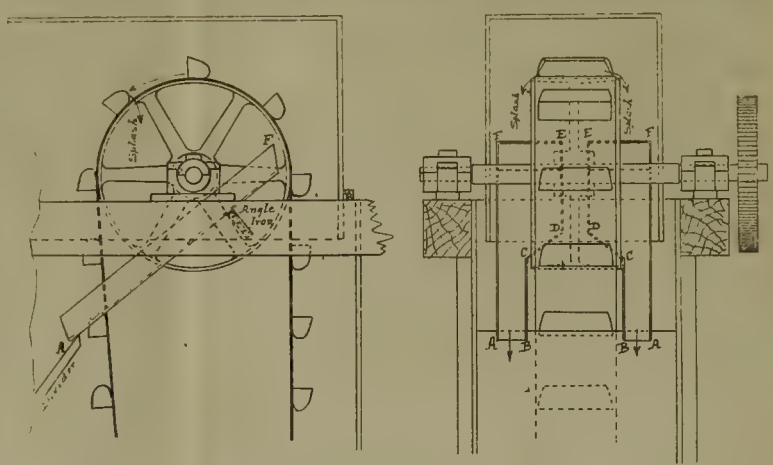
The Editor:

Sir—I have been much interested in the discussion of belt elevators in your issues of October 31 and November 28, by Messrs. Caetani and Lewis. In the mill for which I am responsible there are half a dozen elevators ranging from 8 to 22 in., handling wet and dry material of different sizes. In the course of years the usual troubles have been experienced, and the following is a description of the remedies that have been applied to improve the efficiency of the elevators and to reduce repairs.

Head pulley.—With moderate size elevators of 14-in. belt or less, I never had any trouble with the head pulley getting loose on its shaft, although ordinary solid hub pulleys with one key are used. However, this difficulty was repeatedly experienced with a 22-in. elevator, lifting about ½ ton of pulp per minute to a height of 45 ft. The manufacturers had provided an ordinary 52 by 23-in. pulley, fitted with only one small key on a 4 1/16-in. shaft. After many unsuccessful trials to make the pulley stick to the shaft, the trouble was finally remedied by taking another shaft of 5⅝ in. and fixing the pulley on this shaft with two keys of ¾-in. height by 1½-in. width, only slightly tapered. The keys are so long that they come out at the other side of the hub and are secured by two set-screws with locknuts. This arrangement has proved entirely sufficient. On large size elevators it is better not to use collars fixed by set-screws on the upper shaft, because they often become loose on account of the constant jarring; it is preferable to have shoulders turned on both ends of the shaft.

Contrary to Mr. Lewis' opinion, I have found it a great benefit to line the head pulley with belting. If the rubber covering of the belt at the back is somewhat worn, the heads of the bolts that hold the buckets stick out on the surface of the belt, and this causes constant slipping of the belt on the bare surface of the head pulley. I believe that either balata or old rubber belting that has lost its cover should be used, because it offers more friction than a smooth rubber surface. It seems an advantage to have the pulley heavily crowned as Mr. Caetani suggests, and I wonder why manufacturers do not make them that way. The shaft may be ever so carefully leveled when the elevator is started, but the bearings do not wear equally, and it may get out of level at any time, causing belt and buckets to run to one side and possibly damage the housing. It is certainly easier and safer to use crowned pulleys than to check the level of one's elevator shaft every few days.

In order to prevent unnecessary spilling, the head pulley should be of small diameter. If the buckets run fairly full and are forced to pass over a large head pulley, the tilting is done so gradually that much pulp is emptied over the sides of the pulley instead of in the receiver. The ideal, though practically impossible, is an abrupt tilting of the buckets. But, although a small head pulley gives higher efficiency, it does not offer enough friction to the belt, and when constructing an elevator one must compromise so as to obtain a serviceable appliance. It is strange that manufacturers of mining machinery often build elevators that are destined to be failures. For instance, I remember a 20-in. elevator, built by a well known firm in the United States, that was supposed to lift pulp to 30-ft. height and had been constructed with a 30-in. head pulley and 2 1/16-in. shaft. It had a special sheet-iron boot which was so narrow that there was barely two inches of play between the rim of the pulley and the sides of the boot. The whole affair had more the appearance of a toy than of an elevator, and it had to be entirely rebuilt before it could be used.



DESIGN OF ELEVATOR.

Gears.—Mr. Caetani prefers direct drive to gears. In this I cannot agree with him, because direct drive means

a slowly running driving belt, and such belts are a nuisance in a mill. If slow-running belts are to give reliable service they must be of considerable width, even if the power they have to transmit is small. Further, the wear on slow-running belts is much heavier than on fast running ones, and therefore more is spent on new belting than is saved by not using a gear. But, even if gear is used, there is always a belt required to drive the countershaft from a motor or line shaft, so there is no rigid connection as Mr. Caetani observes. All the trouble that has been caused here by gears on elevators during several years was confined to one broken pinion which was replaced at a cost of $12. The noise made by gears is trifling, and it certainly cannot be heard at all in a mill where 30 stamps are dropping.

Feeding.—A trial has been made here applying both methods of feeding to the same elevator, namely delivering by a spout in front of the bucket-line, or feeding from the side or back into the boot. The latter way proved to wear out the rims of the buckets twice as fast, on account of the scraping of the buckets over the sand in the bottom of the boot. The pulp did not contain any coarse particles, all the sand being finer than 1 mm. The feed spout should be so placed that there are always two buckets in vertical position beneath it to receive the pulp stream. This insures minimum splash and thereby reduces the scraping up of sand by the buckets from the bottom, which has proved so detrimental.

Buckets.—For elevating pulp I prefer malleable-iron buckets with extra heavy rim. The life of the steel plate bucket is much shorter, and it frequently starts leaking at the joints after having been used for a short time only. It is, of course, quite possible that for other conditions the steel bucket is cheaper, but where every ton of machinery is subjected to a freight charge of about $80, those buckets that have the longer life are the cheapest, even if the initial cost is considerably higher. I never found that on account of the increased weight of the buckets the elevator needed more power, or that the belt wore faster. Where the rim of the bucket touches the belt it should be rounded so as not to cut the belt or pad when tilting. I prefer a solid rubber strip behind the buckets to the washers mentioned by Mr. Caetani; it happens that the washers tear and are lost and then the bucket will become loose. Old vanner belting is a good material to put behind the buckets. On elevators that handle wet material I have all the buckets shifted to another place on the belt every four months or so, and all the necessary holes for the places which the buckets will afterwards occupy are punched before the belt is put on, thereby reducing the time of changing buckets to a minimum.

Belts.—After having tried several different kinds, I use at present only 6 or 8-ply rubber belting with a heavy rubber coating on the side that runs on the pulleys. The other side does not need an extra rubber protection, because when the strips I referred to before are used between belt and buckets, there is very little wear on that side of the belt. It is very important not to damage the rubber covering on the back, because sand will get in through cuts and cracks and become lodged between the canvas and the rubber, forming elevations which have the appearance of blisters, and once these are formed the rubber comes off very easily. Ordinary elevator bolts generally have rather small heads, and are therefore, when being tightened, drawn into the rubber covering of the belt and tear it. To prevent this, I have used a 2 by 2-in. square washer of $\frac{1}{16}$-in. sheet iron between the head of the bolt and the belt, so far with good results. Rubber washers did not prove a success for this purpose; they wear and fall off, and then the bolt gets loose. I have also tried bolts with special washers, as are used with Jackson's belt lacing, but they are expensive and not better than the ordinary bolts with home-made washers.

Lower bearings.—There is no reason why the pulp should overflow the bottom bearings when the elevator is stopped, as Mr. Caetani says; if the elevator sump is provided with an overflow at a lower level than the bearings the pulp may be run into a special tank, or into the draining launder of the mill floor. However, when the elevator boot is placed at a low level in the mill, this may be difficult, and then it is advisable to use closed bearings as described by Mr. Lewis. Even in this case, a stoppage of the elevator need not cause the bearings to be flooded, if the boot is built in a tank which does not fill in the time that is needed to stop the feed. I use closed bearings with stuffing-boxes on an elevator which unfortunately has its bearings frequently flooded, and it proved entirely sufficient to keep the grit out. Bearings of this type, if kept well packed and greased never allow any sand to get inside; I have used them on drag classifiers where they work all the time in thick sandy pulp, and they never caused any trouble. It is better to use grease for lubricating than oil, because the pressure from the grease cup helps in preventing dirt from entering the bearing at the gland.

In every instance the bearings should be provided with a take-up device which allows the belt to stretch at least 18 in. before it needs to be shortened.

Foot pulley.—It is a common mistake of elevator manufacturers to fix the lower pulley on its shaft with set-screws only; on account of the lower shaft being out of sight, one does not notice it when the set-screws get loose and the pulley starts to revolve on its shaft. It is only found out when the harm has been done, and then there is no other remedy but to put a bushing into the hub of the pulley and to get a new shaft. It is not safe to rely upon the set-screws, the trembling of the elevator will loosen them, and a key should always be used.

Perpendicular or inclined elevators.—For handling wet material I could never find any advantage with inclined elevators. They are supposed to discharge better, but the same effect is obtained by using a small boot pulley. An inconvenience is that they need idler rollers to support the ascending belt, which means extra cost of maintenance. For dry material the inclined construction is much better, because it is much cleaner, not spill-

ing material at the feed spout. For this work I prefer square buckets of thin sheet steel, placed so close together that the feed never falls directly against the belt.

Casing.—A well constructed casing is more essential for successful operation than generally is supposed. Common errors are to make the case too narrow, to have the boards placed horizontally, or to have them placed outside the frame. The boxing must be so wide that the splash hits it as little as possible, and the belt never scrapes against it even when not running in the center of the pulleys. When the planks are placed vertically the wear to which they are subjected by the splash of the pulp is very little, and if the framework is protected by the planks it does not wear at all. The boot must be always slightly longer and wider than the housing, so as to collect any drippings that run down along the casing, and the hood must be narrower and shorter for the same reason, and also to prevent pulp falling on the supporting beams of the upper bearings and getting into those. Most splash of pulp is where the belt descends, and it is advisable to lag that side of the casing with discarded belting. To protect the lower bearings from splash, conical shields of sheet iron can be fixed on the ends of the bottom shaft, which also prevents any splattering of pulp through the slots in the boot through which the shaft passes. The distance of the upper bearings should not be less than from 2½ to 3 times the width of the belt, and if the above described design of casing and boot is followed, the bottom bearings are still a little farther apart. It is obvious that this construction requires heavier shafting than when the bearings are close together, that the elevator occupies more room in the mill, that more lumber is needed for its construction, and that consequently the cost must be higher than when following the usual narrow design. On the other hand, the advantages that no pulp drips through the housing on the mill floor, that the bearings are kept free from grit, and that the woodwork scarcely needs any repairs, more than offset the higher cost of installation.

Boot.—A square wooden tank of 2-in boards makes a practical boot for pulp elevators. The corners will of course fill with sand, but if it is fine enough, it does not pack so tightly as not to give way somewhat if a bucket or something else falls into the boot, whereas with a round iron boot that closely follows the outline of the buckets generally some harm is done. It should be so deep that from 8 to 10 in. of clearance is left between the bottom and the bucket in its lowest position, supposing the take-up bearing to be entirely screwed down.

Receiver.—For an elevator working under normal conditions the receiver as described by Mr. Caetani is quite sufficient, but if it is heavily loaded a slight modification is necessary. The buckets then run nearly full and more pulp is spilled over the sides of the head pulley during tilting. Further, where much work is required of an elevator the buckets may be spaced closer on the belt than usual, but this again causes spilling on account of the buckets emptying part of their contents against the bottom of the preceding ones. To catch all the spillage and direct it into the receiver, special trays should be built on both sides of the pulley, made either of boards or sheet iron and held in place by angle irons fixed to the supporting beams of the upper bearings. Their lower end rests on the dividing board of the receiver. In the accompanying sketch their outline is indicated by the letters ABCDEF. The width of these trays depends upon the size of the elevator and the amount of splash, and they must be provided with rims on all sides to prevent the pulp from running or spattering over. The pulp they collect is discharged at AB into the receiver. It is, of course, better to have an elevator of ample capacity, but, through changes in the mill, the amount of pulp that an elevator has to handle may be increased, and then the expedient to place more buckets on the belt and arrange the receiver as described will greatly add to the capacity.

M. G. F. SÖHNLEIN.

Banding of Ore Deposits

The Editor:

Sir—Referring to the editorial in the issue of January 9, 'Banding of Ore Deposits,' I note that you do not seem to recognize the theory of mining geologists in the field upon that subject, to-wit: That after a fissure was first made, and filled with one, or, two, or more bands, it, for a long time thereafter, constituted a plane of weakness in the earth's crust such that subsequent dynamic action in that region was very likely at any time to reopen the fissure, when it would be filled with more 'bands' of a different period and different composition; and this process could naturally occur an indefinite number of times, causing an indefinite number of bands produced at different periods, and naturally of different composition. Conversely, at any time before the fissure was completely filled with vein matter, the opening may have been forcibly closed ('slammed shut') by like subterranean forces, and deposition stopped for a period, until it was reopened again. If this theory of successive reopening of the fissure and deposition at different periods is admitted, it accounts for all the essential phenomena of 'banding of ore deposits.'

CHESTER T. KENNAN.

Colorado Springs, Colorado, January 21.

[Our correspondent seems to be confusing two sets of phenomena. Reopening of a fissure is not uncommon, and the resulting vein structure is easily recognized. But in such veins as those referred to in the editorial there is no evidence of any dynamic action, which is one of the reasons why they are so puzzling. It is quite possible that when sufficient evidence has been accumulated they will be found to be quite easily explicable.—EDITOR.]

LABOR EMPLOYED on the Panama Canal zone on January 20 totaled 20,926 persons.

CONCENTRATES

Readers of the MINING PRESS *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

MOSQUITOES AND MALARIA in the Philippine Islands are to be investigated by the Bureau of Science at Manila.

CARAT is a term to denote quality of gold and not weight. It is only used as a weight in connection with precious stones, 1 carat being equal to 3.166 grains, troy.

WE DO NOT KNOW of any amendment in the law relating to annual labor which prevents trails, roads, or buildings necessary for the development of the mining claim from being counted as assessment work. The only questions involved are as to the value of the work and whether it tends to develop the claim as a mining property.

AMALGAMATED COPPER PLATES may be scaled of their gold film by the use of sal-ammoniac and sulphur. A powdered mixture of these is spread evenly over the copper plate so that the whole surface is covered with the mixture to the depth of an eighth of an inch or so. The entire surface of the plate is then carefully and gradually heated from below until combustion of the sulphur is completed. The gold scale is removed in the form of large laminae after cooling.

MINE HAULAGE PROBLEMS are usually separated into three divisions: (1) underground haulage, that is, from the working face of the mine to the bottom of the shaft, or to the surface in the event that the mine is opened by tunnel or adit; (2) surface haulage, which delivers the ore or coal from the mouth of the shaft to the ore-bins at smelters, or coal tipples at railway yards; and (3) hoisting, that is, handling the ore or coal from the mine through either vertical or inclined shafts to the surface, according to A. H. Fay, of the U. S. Bureau of Mines, in a paper to the Electric Vehicle Association.

EVOLUTION of mine haulage may be summarized as follows: human carriers; two-wheel carts and wheelbarrows; wooden cars on wooden tracks, these tracks in 1803 covered with strap iron, and the motive power largely women and children until 1842; ponies in 1846 in English mines; iron tracks with strong wooden cars, and sheet iron cars of one-ton capacity with men and ponies as power; larger cars with mules and horses; wire-rope tramways; gravity planes; belt conveyors; dogs were used up to 1909 in a coal mine in Illinois, while in the Far North (Alaska and Klondike) they are indispensable; steam locomotives since the early fifties; wire-rope haulage introduced about 65 years ago; compressed-air locomotives in 1885; electric locomotives in 1887; auto-trucks; and the latest, the gasoline locomotive. There might also be classed under the head of mine haulage the steam, air, and electric hoisting systems for raising ore and waste from mines, after it has been conveyed to the bottom of a shaft by one of the haulage systems mentioned.

SECTION 690 of the California Code of Civil Procedure provides: "The following property is exempt from execution or attachment, except as herein otherwise specially provided: (5) The cabin or dwelling of a miner, not exceeding in value the sum of $500; also his sluices, pipes, hose, windlass, derrick, cars, pumps, tools, implements, and appliances necessary for carrying on any mining operation, not exceeding in value the aggregate sum of $500; and two horses, mules, or oxen with their harness, and food for such horses, mules, or oxen for one month, when necessary to be used on any whim, windlass, derrick, car, pump, or hoisting gear; and also his mining claim, actually worked by him, not exceeding in value the sum of one thousand dollars. No article, however, or species of property mentioned in this section is exempt from execution issued upon a judgment recovered for its price, or upon a judgment of foreclosure of a mortgage or other lien thereon."

HAULAGE SYSTEMS which are indispensable to the mining industry do not serve their purpose without a great harvest of death and injury among those who by the nature of the work are compelled to perform a certain amount of labor connected therewith. The total number of men killed in the hauling and hoisting accidents in coal mines during 1913 was 584, or a total of 21% of all fatalities. In the metal mines, the total number of men killed in haulage and hoisting accidents was 168 or 24% of all mine fatalities. The number of men injured by haulage or hoisting accidents in metal mines in 1913 was 5432. There were employed in the metal mines 193,000 men during the year, so that the haulage and hoisting injuries represent 28 out of every 1000 men employed. The total number of fatalities in coal and metal mine haulage and hoisting systems was 752 in 1913. There were employed in the coal and metal mines during this period 940,732 men, thus making the fatality from these two causes about 8 per 10,000 men employed. Accidents in the haulage systems occur in many ways, among which may be enumerated breakage of cables, falling down unprotected shafts, struck by objects falling down shafts, run over by mine cars or locomotives, accidents due to coupling of cars, accidents due to cars jumping the track, and caught between cars and side of entry or drift.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

SACRAMENTO, CALIFORNIA

LEGISLATION AFFECTING THE MINING INDUSTRY, THE OLD ARGUMENT, 8 HOURS AT THE FACE, OR FROM COLLAR TO COLLAR.

Mine operators gathered in force at Sacramento, Thursday evening of last week, for a public hearing on various bills relating to mining now before the mines and mining committees of the California General Assembly. The bill which attracted most attention, and opposition, was one introduced by Mr. Harris of Kern county at the request of the miners' union and with the approval of the Federation of Labor. It proposes that in underground work the eight-hour day established by law in California shall be interpreted to mean from the time a man enters the mine until he leaves it; that is, 'from collar to collar.' When the eight-hour law was enacted a few years ago, there was a difference of opinion on this point. The men contended for the interpretation now proposed; the operators held that the proper view was that the law was intended to prevent men being required to work more than eight hours underground, and that accordingly eight hours 'at the face' might be properly required. There would seem to be ground for this contention, since even the proponents of the present bill do not ask that lunch time shall be paid for; in other words, there is no contention that it is dangerous for men to stay underground more than eight hours—merely that they should not work long hours there. The matter was settled at the time it arose by compromise, and at most California mines the men go in on company time and come out on their own. This plan has seemed to work very well, and operators employing more than 5000 men testified before the committee that they had had no complaints. At certain of the mines even direct inquiry had failed to discover any dissatisfaction. Mr. Harris and Mr. Paul Scharenberg, the latter the secretary of the State Federation of Labor, stated nonetheless that there was dissatisfaction, though they refused to commit themselves as to how extensive or even as to how many union miners there are in the state. They urged the bill on the broad grounds that it was a proper interpretation of the law; that if the men were to go in and out on company time their entrance and exit would be facilitated, whereas now, it was alleged, they had to walk and climb long distances unnecessarily; and finally that the proposed interpretation was already accepted in Arizona, Nevada, and other Western states where mining flourished, and so could not be held to constitute any fatal burden on the industry. The operators held that the situation was similar to where men work in an office in a high building. No one thinks of asking that they be allowed pay for time riding up to their office, why then should they be paid for time riding down to a stope? It was also shown that at most of the mines where considerable time was involved, as at the North Star, Empire, and others, where long slopes afford entrance, the men ride to the various levels in cars and that the time could not be shortened except by running at dangerously high speed. In other mines where entrance is through adits, it is not always possible to introduce a trolley system without also introducing danger. At the Melones and Mammoth, where unusually large adits had been driven, this was possible, and electric haulage was in fact furnished. It was the general testimony of the managers that under the proposed act the loss of time to the companies involved would range from 15 minutes to one hour per day, with a general average of 30 to 40 minutes. This would be a small matter to the men individually, but might well be the 'last straw' in the case of numerous mines now being kept open by assessments on stockholders. Mr. F. J. Martin pointed out that the Utica, which is virtually the support of a whole community, had not made a profit for years and was only kept in operation on the hope that better ore might still be found. Another mine was cited which had been operated six years and had distributed $600,000 in wages and $9000 in dividends. It is an open secret that many mines are run at an actual loss in hope of finding good ore. Manifestly, each additional increase in cost decreases the probability that stockholders will take this chance, and it will not do to brush this aside, as Mr. Scharenberg was disposed to do, as being merely a repetition of old statements that an industry is about to be ruined whenever a new burden is laid on it. Mr. Charles Knox stated that at the Black Oak mine

the actual effective working time was now only about 6½ hours, and other operators gave 7 to 7½ hours as the time spent at the face. As W. J. Loring pointed out, the 'rules of the game' had been materially altered in the four years since he began to study the Plymouth with a view to reopening it, and if further and continual changes of this sort were to be made, it was bound to enter into the calculations of those who might otherwise attempt reopening of the old mines. There was much further testimony to the same effect, namely, that the proposed change was an uncalled for and unwise additional burden on an industry that was in bad condition already. The same arguments were advanced against the various bills proposing to require the use of water drills in the mines and establishing a mine inspectorship. It was shown that water drills were not always necessary, and that it is difficult in many situations to force the men to use them or even to use respirators. The bills were also shown to have been carelessly drawn, and the situation is already covered by the safety rules now being framed by the Industrial Accident Commission. As this body has now

full authority in the matter and is proceeding actively and intelligently to formulate and put into force an adequate mine safety code, there was strong protest against the proposed legislation. No action was taken on any of the bills, but they were made special order for the committee March 26, at which time Mr. Harris and Mr. Scharenberg promised to have miners there to present at first hand the miners' arguments. Among those attending the hearing were G. W. Metcalfe, John Mocene, F. J. Martin, C. E. Uren, William Hague, G. W. Starr, Paul S. Cole, Webb Smith, W. J. Loring, J. E. Davis, Charles Janin, H. Foster Bain, and others.

NEW YORK

Position of the Alaska Issues on 'Change.—Jumbo Extension.—Dome, Hollinger, and Crown Reserve.—Mineral Development Co.—Miami and Chile Copper.

Alaska Gold Mines has been something of a star as a market leader for the past week. That is, it led, though there was little or no market worth mentioning to follow. There are those who predict that precious metal issues are to occupy the centre of the stage for a time. However, gold-producing properties are so dissimilar in character and are severally governed by such a varied set of conditions that it seems meaningless to attempt to group them. Coppers can be brought to some sort of standardization, but a gold mine is a gold mine, and ordinarily does not lend itself to classification. Perhaps the Rand is the exception that proves the rule. In the United States the Homestake's great success with low-grade milling ores has produced no real rivals. It is possible to find, almost any time, somewhere in the financial district in New York, a man owning ground containing the Homestake veins and who is looking for big capital for development purposes. As far as can be determined, he never finds it, but his persistence shows the attraction that lies in the large orebody. Once nothing attracted attention but high-grade ores; now the public, with the example of copper in mind, evidently looks on Alaska Gold as pregnant with possibilities. This somewhat changed, or broadened, attitude of the public is creating some opportunities in unexpected quarters. Heretofore, the interests controlling the Alaska Juneau have been quite emphatic in their stand that the property was to be operated as a close corporation. On more than one occasion, some strong interests have asked permission to participate in the development of the Alaska Juneau, only to be informed that assistance was not needed. Now it is stated, apparently on good authority, that the Alaska Juneau is to be made the market leader of the group. As a matter of correct classification, this group should include the older properties on Douglas island, the market for which is in England, and which cannot, therefore, be made a part of a market movement based on the development of this entire region. There has been as yet no announcement of the organization details, nor any intimation as to the basis upon which the invitation is to be extended to the people at large, but in the light of the experience of Alaska Gold, the offering should beget no little enthusiasm. In the meantime, things have not gone so well with the Ebner, which adjoins the Juneau, and which has been under examination and systematic exploration by the United States Smelting, Refining & Mining Co. The financial situation is too complicated to unravel in limited space, but briefly the Company wants the Alaska Ebner to return the money which has been spent in exploration, some $400,000.

The Jumbo Extension litigation is now getting a full share of attention from Eastern shareholders. Willard P. Ward and Isaac Untermeyer of New York, and W. H. Dickson of Salt Lake City are trying to get the stockholders to unite in opposing the apex litigation. In the meanwhile, market operations in the stock are based on the buyers' or sellers' view of the apex doctrine.

As has been many times remarked in this correspondence, in mining matters one should learn to look for the unexpected. Porcupine has broken out into activity after a prolonged period of hibernation. The 'Big Dome' is to expend something like $500,000 for additional stamps to crush its low-grade ores. As a preliminary to some new financing, which is expected to be done through the sale of stock, the shares have been advanced from around $6 to $11 per share. A probable dividend is being discussed by market operators; it is hardly to be thought that the gentlemen making up the Dome's board of directors would drift so far away from business principles as to pay dividends and issue additional treasury stock at the same time. Many so-called mining companies have been guilty of the like, but they have not been guided by men of such calibre as those who administer the financial affairs of the Dome.——Hollinger has also come to life, and the doings in the two Porcupine leaders, in conjunction with the recent strike and consequent market interest in Temiskaming of Cobalt, have combined to make more activity in Canadians than has been seen for a long time.——The Crown Reserve management has taken an option on the Bonanza mine, in the Pis Pis district in Nicaragua, which was for some time under consideration by the Camp Bird company, but which was dropped about the time of the outbreak of hostilities, presumably because of the impossibility of financing anything in London. Sam Cohen, of the Crown Reserve, is now on his way to Nicaragua to assist in making the examinations. It is stated, but it could not be confirmed, that the General Development Co. has an interest in the option.

H. Vincent Wallace, who is in charge of the operations of the Mineral Development Co. at Guanajuato, Mexico, writes that two or three small ore-shoots have been found in the long cross-cut which is being driven to reach the extension of the orebody of the Valenciana, and that in his opinion the cross-cut is now into the foot-wall of the Veta Madre. The Mineral Development has been a long-drawn-out operation.

Miami is receiving an increased share of attention market-wise. It has advanced sharply and been considerably more active than usual on the strength of possible resumption of dividends.——Chile Copper is to begin production in about five weeks. The power transmission line has been completed and connected; the railway line between the mine and the mill, and the lines carrying the steam-shovels to the excavation benches, have all been put in readiness. The 40 miles of 12-in. water-pipe line has been placed in commission and the water turned on. It will take a considerable time to 'tune up' the whole plant to its present estimated capacity of 10,000,000 lb. per month. The developed ore of the Chuquicamata, as proved by the churn-drills, is now estimated at more than 300,000,000 tons of 2.1% ore.

LONDON

Résumé of the Cornish Tin Situation, Including Returns, the Dolcoath and Carn Brea Properties.

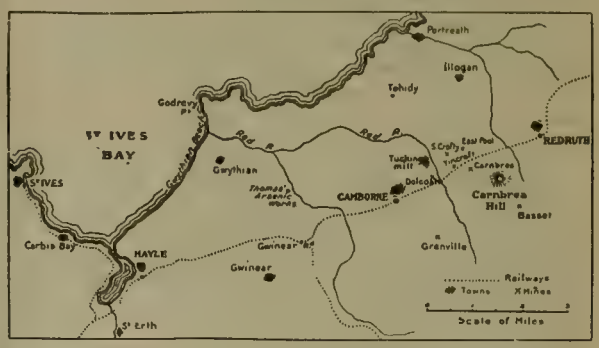
As mentioned in a letter a few months ago, the Cornish tin mines were severely hit by the dislocation of the tin market following the outbreak of war. At the time, Cornishmen were feeling terribly down-in-the-mouth. With the London Metal Exchange closed and no official quotation for tin, the fortnightly sales, or ticketings, at Redruth could not be held. Consequently black tin accumulated, and many of the mines finding themselves without income had an anxious time of it. Fortunately they were able to borrow money on their concentrate. The present is a suitable time to study the Cornish position in order to see the actual effects of the war. The general impression gained by such a survey is that things are not anywhere near so bad as they might have been. Cornish

mines have recently reached another era of impoverishment in depth and under such circumstances it might be imagined that the war crisis would give them their final quietus. It speaks volumes for the pluck and endurance of the managers and directors that so few of the mines have gone under.

Naturally we take Dolcoath first. The concurrent fall in the yield per ton, and the price of the metal during the first half of 1914, nearly extinguished the profit. During the second half of the year the further fall in the prices of tin made it advisable to mine a smaller tonnage and draw on the richer reserves. Thus it is found that 57,254 tons yielded 728 tons of tin concentrate during the first half-year, and that 48,058 tons yielded 710 tons during the second half, the yield per ton advancing from 28½ to 33 lb. At the same time the average price of concentrate decreased from £92 14s. to £83 18s., and the total income from the sales from £67,544 to £59,672. Expenses were only just met. As regards the future of this mine, the present indications are extremely discouraging. For years, even the most hardened mining geologists hesitated to think of Dolcoath as anything other than immortal. They would as soon, as Sydney Smith used to say, speak disrespectfully of the Equator. The announcement made two years ago by *The Mining Magazine* to the effect that developments at depth were well-nigh hopeless, came therefore like the proverbial bolt from the blue. Six months ago Malcolm Maclaren was commissioned to make a geological examination. His report has not been published, but R. Arthur Thomas, the manager of the mine, states that Mr. Maclaren's opinion is against sinking below the present deepest level at 3300 ft. Mr. Thomas does not share this opinion, and intends to sink another 300 ft. and explore from this lower level. While writing of the question of persistence of ore in depth in Cornish mines it may be mentioned that an eminent Cornish engineer, when speaking of Dolcoath, said that this mine had paid dividends a century ago and was paying dividends now; no doubt when he retired in due course to the realms above he would be able to look down a century hence and see dividends still being distributed. To this a flippant shareholder remarked that if our friend proceeded eventually to the nether instead of the upper regions, he might be able to be of greater practical service to Dolcoath. To revert once more to serious vein, the sinking of the Williams circular vertical shaft to cut the lode at depth, has unfortunately not proved to have been a good investment. When it was started the condition of the mine in depth was excellent, and the scheme, as a speculation, was fully warranted. It just happens, however, that serious impoverishment started at about the point of intersection of the shaft and the lode, and consequently the ore hoisted through the new shaft has been relatively small. The shaft and its equipment have cost over £100,000. Indirectly the shaft has served the useful purpose of improving ventilation. Indeed it is doubtful whether the mine could have been efficiently worked during the last year or two without the advantages in this direction provided by the shaft.

Carn Brea & Tincroft has managed to pull through the half-year in a much better fashion than was expected. This Company, owning a group of mines on the other side of Red river to Dolcoath, has had a rough time of it ever since it was reconstructed under limited liability in 1900. It never had enough capital to reorganize the underground system and the surface plant. As it is, the mines consist of an agglomeration of independent workings, and the pumping, hoisting, and milling plants were allowed to remain with the casual connection between each other as before the amalgamation. The ore has for many years been of low grade, the yield per ton averaging only about 25 lb. of black tin. Sixty years ago the average content must have been 80 to 100 lb. per ton, and the dumps remaining from those days contain as much tin as the ore now being worked. Four years ago the directors decided to get a successful outside engineer to take the management, and they appointed E. S. King to the post. Mr. King had done well in Western Australia and is a man of ideas, and he introduced as many reforms as he could without capital. But he was unable to find higher-grade ore, and he could not prevent the fall in the price of tin, so his efforts have all been in vain, and he resigned last summer. It has been found necessary to close the Carn Brea section and to devote sole attention to North Tincroft, and instead of making serious losses, as was the rule a year ago, the monthly balances are now on the right side, though the margin is perilously narrow. The report for the second half of 1914 shows that the financial position was saved by the Bolitho family, who advanced money on the security of the concentrate produced. Owing to the closing of the Carn Brea, the tonnage mined was only 29,372 as compared with 45,537 when both mines were fully worked a year before, and the yield of black tin was 304 tons, against 391 tons. The extraction per ton of ore rose from 19 to 23 lb. The half-year ended with the small loss of £283, which under the circumstances was a good result, and compared favorably with the loss of £12,899 a year before. The Company will keep going, for it is strongly backed by the owner of the mineral rights, Lord Clifden, who has lent money at low interest for the erection of modern dressing-plant.

The South Crofty, also at Camborne, deserves special men-



PART OF CORNWALL, ENGLAND

tion, as it constitutes the best example of the thorough overhauling of underground methods and concentration systems on modern lines that can be shown in Cornwall. The mine had been worked for many years on the cost-book plan, but had drifted into inefficiency, owing to the leading shareholdings being in the hands of trustees who could not by law allow the estates of the deceased shareholders to provide additional working capital. In 1906, the Allen-Meyerstein group in London presented a scheme for reconstruction under limited liability that was acceptable to the old shareholders, and moreover had the excellent advantage of providing a large amount of working capital. By this means it was possible to sink a new shaft and erect entirely new plant. The ore is complex, containing tin, wolfram, and arsenic, and it is far from being rich. Treatment is necessarily complex, and a full description of the plant, with discussions of the experimentation and the reasons for adopting certain methods, was given in the issue of *The Mining Magazine* for June 1913. It is generally said that the manager, Josiah Paull, combines the practical and scientific elements that go to make a successful manager, to a greater degree than any of his confreres in Cornwall, and this without disparaging in any way the business ability and long experience of other managers. During the past two years development at this mine has not disclosed any ore of high grade, and not too liberal a supply of ore of medium grade. In spite of this, however, excellent dividends were paid for 1912 and 1913. The serious drop in the price of tin hit the Company hard during 1914. Nevertheless it was possible to pay a small dividend. The report shows that 69,842

tons of ore was mined and milled, yielding 644 tons of black tin, 113 tons of wolfram concentrate, and 706 tons of arsenic. These results were much the same as those for the previous year, but owing to the fall in the price of tin, the income from the sale of products was only £79,654 as compared with £100,085, the yield per ton being worth 22s.9d. ($5.46), compared with 28s.10d. ($6.92). It has been possible to reduce working costs, which were 20s.7d. ($4.94) per ton, against 22s.2d. ($5.32). The net profit for the year was £2653 ($12,500), and adding this to the balance brought forward from the previous year made a disposable balance of £4608 ($22,000). Out of this, £4375 ($21,000) has been distributed as dividends, being at the rate of 8¾%. It is interesting to note that there has been no difficulty in selling the wolfram concentrate in England. Hitherto all this product of the Cornish mines has gone to Germany. During the past few months the High-Speed Tool-Steel Co., which has erected a works in Lancashire, is taking all the wolfram offered.

The East Pool & Agar is another old Cornish property that has had the pleasant experience of the acquisition of additional capital for development. From 1834 to 1913 the mines were worked on the 'cost-book' plan, and in later years, in spite of this old-fashioned system of finance, large sums of money were devoted to improvements in milling and concentration. Unfortunately underground development did not keep pace with requirements, and three years ago a run of bad luck as regards the content of the ore milled brought the Company to a serious position. Bewick, Moreing & Co. came to the rescue by introducing £30,000 capital. The Company was reorganized under limited liability, and this firm was made general managers. The development done under their guidance has been attended by excellent results. Not only have the known lodes been developed to advantage, but an entirely new orebody has been discovered north of the present workings that promises to be of unusual importance. The lode has been cut through for 30 ft. without the foot-wall being found, the driving of the cross-cut being suspended temporarily owing to the heavy flow of water encountered. Drifts east and west on this lode average, for the distance driven, over 70 lb. of black tin per ton, for a width of 5 ft. exposed. When it is remembered that the average yield of the ore milled at this mine for the year ended December 31 last was only 17.6 lb. black tin per ton, and that the total working cost, including all development, was 17s.9d. ($4.26) per ton, it will be seen how important an effect this discovery, if maintained, will have on the future of the Company. The report for 1914, accompanied by a plan showing the developments for the past year, is presented in a form that might well be copied with advantage by some of the other leading Cornish companies. The quantity of ore milled was 81,593 tons, which shows an average duty of 26.5 tons per day for each Holman pneumatic stamp. The yield was 644 tons of black tin, 108 tons of wolfram concentrate, 456 tons of crude arsenic, and 20 tons of copper concentrate, the monetary value of the whole being 17s.2d. ($4.12) per ton milled. The average chemical assay of the ore was 15.8 lb. metallic tin per ton, and the tailing averaged 4.68 lb. metallic tin per ton. The theoretical extraction was 70.3%, and the actual 70.9%. The managers have had cause to complain of the irregularity of the work of the miners. The lost shifts during the year amounted to as much as 62 per day, on a basis of 308 full working days during the year. The income and expenditure during 1914 just about balanced.

Some time ago I recorded that the directors of the Levant mine near Land's End were contemplating the abandonment of operations at the expiration of the present lease during 1915. The chairman, Francis Oats, of De Beers fame, had lately put large sums of money into the mine. Little profit has been made recently, and the terms on which the leases were to be renewed by the mineral 'lords' were too onerous for contemplation. Under the present circumstances following the collapse of the tin market on the outbreak of the war, the lords have extended the present lease for a year. In the meantime something may happen to change the attitude of the lords.

The Sniff group of companies operating various old tin mines in Cornwall and producing radium from the pitchblende ore at the Trenwith mine near St. Ives has gone into bankruptcy, and receivers have been appointed to protect the interests of the various classes of shares, debentures, and bonds. It is unnecessary on this occasion to recapitulate the story of irresponsible optimism, which prompted financial operations on a large scale and the construction of extensive surface plants, without any systematic effort to ascertain the existence of ore. Of all the properties, the West Kitty at St. Agnes and the Glew at St. Ives, are the only two that have anything like fair prospects, but in either case it is doubtful whether any returns could be made on money invested unless present capitals were reduced by 90 per cent.

HOUGHTON, MICHIGAN

STRIKE INVESTIGATION.—AHMEEK AND NEW ARCADIAN.—FIRST-AID CONTESTS.

No report will be made by the Congressional committee which investigated the Western Federation strike in the Michigan copper district. This committee was sent from Washington through the efforts of C. H. Moyer and his group of paid agitators and politicians. The men on this committee listened to the stories told by strikers and agitators for several weeks, and then, wearied with the farce, granted the mining companies one week for a statement of their case. The committee served but one purpose, and that was to advertise the Western Federation of Miners, and to aid the agitators in misleading the unfortunate workingmen of the district.

Thomas L. Chadbourne, a director of the Ahmeek Mining Co., has proposed to the stockholders that the capital of the Company be increased from the present 50,000 to 200,000 shares.

F. R. Weekes has reported on a detailed examination of the New Arcadian property. Mr. Weekes thinks that the lode is of commercial width and value, and considers the property a good prospect. New Arcadian has several tons of 'rock' on the stockpile, and a test will be made as soon as the Franklin mill is ready for operation.

Six first-aid teams from the mines of the Cleveland-Cliffs Iron Co., on the Marquette range, competed in a contest last week at the general office at Ishpeming. First prize was awarded to the team representing the Negaunee mine, the Stephenson second, and the Gwinn third. These teams were organized about a year ago, and this was their first exhibition.

CALUMET & HECLA TAILING DREDGE AT TORCH LAKE.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

Circle

Practically all of the machinery for the Berry dredge on Mammoth creek has been landed, and the boat should start during the coming season.

Cordova

Recent shipments from the Mother Lode copper mine were as follows: January, 137 tons averaging 14.45 oz. silver and 48.32% copper; and February, 209 tons of 11.45 oz. and 42.64%; the whole netting $28,674 from the smelter. From March 4, 1914, to February 8, 1915, the output was 956 tons producing 934,170 lb. copper and 14,016 oz. silver, the settlement being $91,191.

Juneau

On March 9 the new electric haulage system was started at the Alaska Juneau mine. So far the line runs through three tunnels aggregating 3395 ft., and the total length of the system will be about 2½ miles. There are 160 men employed, according to the superintendent, John Richards.

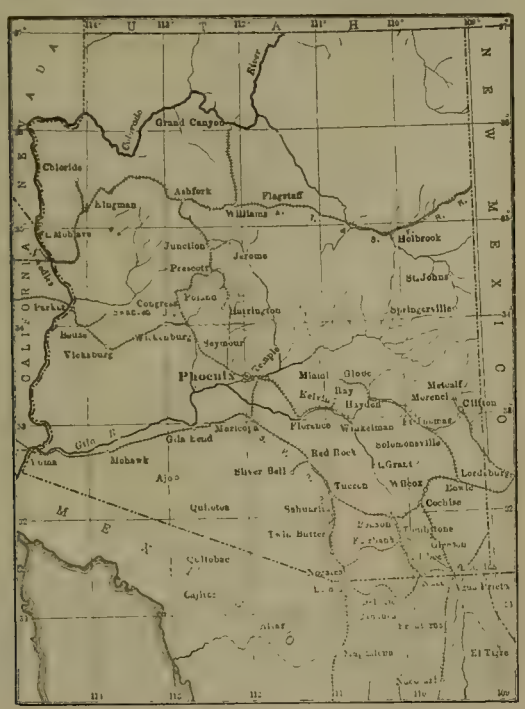
Nome

The post-office at Fairbanks is crowded with second-class mail for Nome, and there is no means of forwarding it.

ARIZONA

Cochise County

From Douglas comes the following news: General Calles has received an order from Carranza to remove the embargo on food supplies consigned to Sonora through Agua Prieta.



ARIZONA AND PART OF MEXICO.

This will relieve distress in the Moctezuma and Arispe districts. As the Villistas and Carranzistas require rolling stock, it is difficult to see how supplies are to be sent to El Tigre and Nacozari, which are almost run out. The mines at these places may have to close, the Moctezuma having little storage room left for concentrate. The Lucky Tigre Combination Gold & Silver Mining Co. held its meeting at Douglas on March 15. Later on a number of shareholders and all of the officials called on General Calles at Agua Prieta, in response to a personal invitation from him.

Some $60 ore was opened in the Juniper Flats Gold Mining Co.'s ground last week. This district is being quietly prospected.

A brief review of the report of the Calumet & Arizona company for 1914 shows that ore reserves were increased by 556,427 tons. Ore sent to the smelter totaled 608,126 tons, yielding copper, silver, and gold valued at $8,504,015. Out of the net profit of $3,085,536, $1,851,089 was paid in dividends. The property was worked at 50% capacity during five months, and costs increased only 0.54c. per pound.

Pinal County

It is expected in Tucson that the Phelps-Dodge Co. or Southwestern railroad, will buy the Southern Arizona railway connecting Red Rock and Silverbell. The road is in the hands of a receiver and is to be sold on March 27. It is said that the reason for the Southwestern buying the property is because when the Gila Bend to Ajo line is constructed by the Southwestern and Calumet & Arizona company, the material on the Southern Arizona line would be used in the new one.

CALIFORNIA

Eldorado County

The Plymouth Consolidated company, of Amador county, has started unwatering the old Montezuma mine near Plymouth. When drained it will be examined for future development.

After three years' development, the Rising drift-gravel mine, two miles east of Placerville, has proved to be a valuable property, and a mill of 7-ton capacity per hour has been constructed at the local foundry. G. W. Englehardt and Charles M. Henson are manager and superintendent respectively.

Shasta County

The Mountain Copper Co.'s new concentrating plant at Minnesota station, between Keswick and the Iron Mountain mine, started last week with 30 men.——The new zinc-sorting plant at the Mammoth mine is working two 8-hour shifts, employing 20 men. A good deal of fine material is produced during crushing and screening, too poor to send to the smelters in Oklahoma, so a jigging plant is to be installed to make a richer product.

A 5-stamp mill is to be moved from the old Spanish mine and re-erected on the Black Cloud and Red Top claims in the Quartz Hill district. Over 5000 ft. of work has been done in the property.——The Yosemite Investment Co., of San Francisco, is repairing the old suction dredge on Middle creek and intends moving it to some new ground.

Sierra County

The 20-stamp mill at the Plumbago mine was destroyed by fire on March 17. The outbreak was caused by a short cir-

cuit in a rotary converter at the plant. The Croesus company owns the property, Walter B. Pearson being in charge. ——Repairs are nearly complete on the flume of the Sierra Buttes mine, and the mill will resume in the spring.

The Croesus Mining Co., owner of the Plumbago mine, has authorized its manager, W. B. Pearson, to have a new 20-stamp mill erected as soon as possible.

Siskiyou County

Los Angeles people have acquired the old McKeen mine at the head of Scott valley, near Callahan, and will erect a 20-stamp mill. A large tonnage of ore has been opened in the mine. James Doyle is manager.

COLORADO

Clear Creek County

The Capital mill completed last week the treatment of 150 tons of ore from the Onondaga mine. The concentrate assayed $70 gold per ton. In the mine the rise is up 155 ft. above the Capital tunnel, and is improving.——In the Silver Plume district J. B. Ballantine has leased the Illinois level, including the Bismarck lode on the Seven-Thirty. This ground is considered the best available.——The Bard Creek mill should be completed early in April. Nelson Bros. have been in charge of construction.——The Primos Chemical Co., of Philadelphia, is shipping two wagon-loads of molybdenum ore daily to the Empire station, where it is loaded on cars and shipped to the Company's plant in the East. It is reported that this Company expects to employ 100 men next summer.——Numbers of other operators in the districts are busy.

Dolores County

Shellhammer and Batchellor, lessees in the Jumbo No. 2, in the Pro Patria tunnel of the Rico Mining Co. at Rico, have opened very rich ore.

Lake County (Leadville)

The Western Oxide Co.'s smelter is being overhauled, and operations will commence in a few days.——The Big Five Operating Co. has received the insurance on account of the fire in its plant some weeks ago, and operations at the Big Four mine have been resumed.——The shoot in the Jennie June is yielding 1 to 5-oz. gold ore.——Preparations are being made for installing the pumps in the Penrose shaft. The pumps will be suspended by ropes, and winches will regulate their position as the water is lowered.

San Juan County

The electrostatic plant at the Sunnyside mine at Silverton is working full time on zinc ore.——The Champion mine is being examined for E. W. Waybright by Louis Shafer.——When the weather moderates, the Ben Butler mine is to be reopened.——The Hercules property was sold by the sheriff to J. R. Smith, of Denver.——The Ledge mill at Chattanooga is to resume soon. The North Star mine and mill has been sold.

Summit County

It is said that the Tonopah Placers Co., a subsidiary of the Tonopah Mining Co. of Nevada, will construct a large hydro-electric power plant near Breckenridge during this summer for its dredges.

Teller County (Cripple Creek)

In January Stratton's Independence produced 5129 tons of $7.08 ore. Low-grade mine and dump ore treated amounted to 10,100 tons. The total profit was $6934.——The Golden Cycle mill, at Colorado City, will have to be operated to its full capacity of 33,000 tons per month as soon as possible. Net earnings of the Company last year totaled $750,000.——Lessees on the Ingham vein of the Doctor-Jack Pot property have perhaps the best lease in the district, it paying from $20,000 to $30,000 per month in dividends.

IDAHO

Idaho County

A controlling interest in the Florence Hydraulic & Dredging Co., involving title to about 1800 acres of placer deposits in the old Florence district, and water rights which serve practically the entire district, has been sold by J. Hanson Hussey to W. C. Hoag, of Spokane. Development work already completed on the property is valued at about $75,000. Mr. Hoag will enter the district on April 1 with a small force of men from Spokane for the completion of the water system and installation of a hydraulic plant, and with the opening of summer a crew of 20 to 30 men will be put to work in the operation of the system. Work yet to be finished in order to bring the necessary water supply to the property will cost about $5000. Over 22 miles of ditches and flumes are owned by the Company.

Shipments from the Coeur d'Alene group of gold quartz claims situated 1½ miles east of Golden, in the Stites district, are expected to be started soon. The property is being operated under bond by Peter Proulx, of Golden. Ore has been blocked out in this group valued at approximately $1,200,000

Shoshone County

The Federal Mining Co. is being sued by Kennedy J. Hanley to quiet his title to the one-eighth interest in the Skookum lode, and a share of the proceeds of ore extracted since 1906, when he won a previous case.——Good progress is being made in enlarging the Interstate-Callahan mill.—Faulting has cut off the ore in the Caledonia mine, but as there are a number of such occurrences in that property, no doubt is felt as to the shoot being found again.

MISSOURI

The biennial report of the state geologist, H. A. Buehler, at Rolla, has been published. It covers 62 pages and is illustrated with several maps, and deals with the work of the Bureau of Geology and Mines during 1913 and 1914. The mineral production of Missouri in 1913 was valued at $47,760,584, to which lead contributed $11,444,935; zinc, $9,664,423; coal, $7,468,308; clay products, $6,598,664; cement, $4,556,822; limestone, $2,486,020; mineral paints, $2,359,592; and sand and gravel, $1,109,233.

Jasper County

The arrival of spring weather will be accompanied by a large increase in prospecting in the Missouri-Kansas-Oklahoma zinc-lead district, on account of the high price of spelter.——The sanitary conditions in the zinc-lead mines of the Joplin district, and their relation to pulmonary diseases among the miners, was the subject of a recent report by A. J. Lanza of the U. S. Public Health Service and Edwin S. Higgins of the U. S. Bureau of Mines. The causes of the complaints and recommendations for their abatement are discussed fully.

A large number of lessees are busy producing ore from the Lone Elm Mining & Development Co.'s property, northwest Joplin.——The H. L. & S. Mining Co. has cut ore in disseminated ground at 170 ft. by drilling.——The Cactus Hills company is moving its 150-ton mill on to a lease of the Lone Elm company, where it will receive custom ore.

MONTANA

Broadwater County

It is now proposed to connect Radersburg with the Northern Pacific line by way of Toston, work to start by June 15. This road will be constructed by the Keating Gold Mining Co., and will consist of a 42-in. gage line 14 miles long. With the Baldwin gasoline locomotives and other equipment it will cost $150,000. At the junction with the Northern Pacific, ore-bins will be built later on. In January the mine

produced 3340 tons of ore which was forwarded by teams to the Washoe smelter at Anaconda. There are 137 men employed, and the output will be 250 tons per day when the line is ready. Large ore reserves are blocked out in the mine.

Rich ore is reported to have been opened at 1090 ft. in the Keating mine. Shipments to the Washoe plant are about 65 tons per day. The directors are considering erection of a concentrator for low-grade ore.

Fergus County

(Special Correspondence.)—The Fergus County Oil & Gas Co. has recently been organized to prospect for oil and gas in this county. It is capitalized at $250,000, and already 4000 shares of par value of $10 each have been sold. Mr. Boerema, late of Calgary, Alberta, is president and promoter of the Company, which plans to purchase its own drilling outfit, and to bore under the direction of the most competent petroleum geologist that can be secured. The strata outcropping between the various mountain uplifts are chiefly of Cretaceous age, and are often folded into quite regular anticlines. The structure, character, and age of the rocks seem to be favorable for collection of oil and gas in profitable quantities, a number of seepages and other surface indications of oil having been found. Natural gas is reported to have been recently found in a well south of the Big Snowy mountains.

Revenue from bullion of the Barnes-King Development Co. from its mine at Kendall in the North Moccasin mountains for 1914 was $422,962, practically all from oxide gold ore treated by the cyanide process. Sulphide ore, estimated at over 7000 tons, has recently been found below the 600-ft. level, and a small roasting furnace will be installed to treat this ore before cyanidation. The exact costs of production for 1914 are not available until the annual meeting held early in March, but it seems probable that the net profits will be close to $200,000 for the year. Naturally this has revived talk of a substantial dividend, which could easily be paid.

Prospecting by churn-drilling is being done by Guy Norman and others two miles south of Kendall. There are no surface indications of ore, but the dome structure appeared to be favorable for the formation of the irregular replacement deposits in limestone, in which the gold of the North Moccasin occurs. Last summer a number of drill-holes were completed, one of which passed through 13 ft. of yellow oxide rock containing gold, commencing at a depth of 285 ft. This hole was continued to 400 ft., where more ore was discovered. A new drilling rig has been purchased, and if further drilling proves favorable, a shaft will be sunk.

Gem topaz has been found in the West Kendall mine, which has been cut into stones resembling diamonds.

Lewiston, February 22.

In February the Barnes-King company produced $41,705 from 4287 tons of ore, equal to $9.73 per ton.

Lewis and Clark County

A report dealing with the Cruse estate properties in the Scratch Gravel and Marysville district states the following: In the former area, the Franklin mine made a profit of $29,597 from December 20, 1914, to March 15, 1915; and at Marysville the Cruse mine made a loss of $8027.

Silverbow County

The U. S. Bureau of Mines rescue-car No. 5, in charge of J. L. Boardman, arrived at Butte on February 18, and will remain until about April 1. During that time the government officials in charge of the car are giving free instruction in the first-aid treatment of injured men to all who may apply for it.

The Gagnon mine accident, whereby four men were killed in the incline shaft on February 6, is described in the Anaconda company's safety-first publication, *The Anode*, for March.——As soon as the East Butte company's smelter resumes, the Butte-Alex Scott mine will again produce ore. The shaft is down 2100 ft., and is to be sunk 100 ft. farther.

The Butte-Duluth company has gone into the hands of a receiver, as it is unable to meet the amount of $50,000 due.

The Anaconda company has reopened the suit with the Pilot-Butte company over the Emily vein near the Badger State mine. The plaintiff alleges that the defendant has disobeyed the restraining order of October 8, 1913. With the reopening of the Pennsylvania mine of the Anaconda, the Company is now operating 15 of its 22 shafts, and employing about 6533 men.

NEVADA

Clark County

According to J. B. Jenson, in *The Deseret Evening News* of Salt Lake City, the Good Springs district is livelier at present than in many years, half a dozen mines shipping, mills operating, and various properties actively developing. The occasion for the stir is the rise in the price of zinc and a recent discovery of platinum-bearing ore in the Boss mine. ——After a shut-down of three months, the Yellow Pine mine has resumed and will increase its normal production of 300 to 400 tons per month, to 800 to 900 tons. This product is zinc and lead. The mine is developed to the 600 and 700-ft. levels, where a large body of zinc is now being opened. In one place it has been developed 70 ft. wide and 100 ft. along the strike, the ore sampling 38 to 40% zinc.——The Mobile property has changed hands. Givver and Hutchens, of Boston, have taken over the property from Sam E. Yunt on a $30,000 bond and lease. It has a 2800-ft. tramway, the longest in the district.——The Potosi is operating three large ore-hauling trucks and will put on two more.——Joe Dedericks, a prominent millman, formerly of Salt Lake City, is operating the Columbia property. He is shipping two to three carloads of copper ore per month.——The Mountain Top is shipping 200 to 300 tons.

At the new town of Plantina a large hotel has been erected to take care of the increased traffic, particularly to and from the Boss copper and platinum mine. The railroad station is Jean, where at every train the platform is crowded with passengers. All teams are busy hauling ore and material, and many new auto-trucks are coming in. It is said that 30 to 40 new automobiles have been purchased in the past 60 days.

Esmeralda County

The eighth annual report of the Goldfield Consolidated Mines Co. states that in 1914 the mill treated 338,192 tons of ore, yielding $3,926,349 net. Of this, $1,835,224 was profit, and one dividend, 30c. per share, amounted to $1,067,744.

In consequence of the uncertainty that has arisen through the apex suit recently instituted by the Reorganized Booth company against the Jumbo Extension and Goldfield Merger, the management of the Lone Star Consolidated, according to the secretary, Joseph S. Henderson, has suspended operations in shaft No. 2, on the extreme southwestern section of the vast property, until satisfactory side-line agreements can be made with companies owning adjoining properties.

The incline rise above the north drift along the latite-shale contact at 1750 ft. in the Atlanta has opened 30 ft. of ore, all of which is suitable for shipment.

Humboldt County

Eight miles southeast from Rochester, on the east slope of Buffalo peak, a mild boom has set in, and all the ground around the new discovery has been staked. Attention is divided between quartz and placer deposits.

Lincoln County

At the Nevada-Utah properties, at Pioche, stoping is under way at 1200, 1300, and 1400 ft. About 5000 tons of ore has been hoisted and 20,000 tons is blocked out between 1200 and 1400 ft. At the present price of spelter the ore is worth $30 per ton at the mine. The output in February was 551 tons.

Mineral County

Work has been resumed at the Giroux claims, 14 miles north of Luning. They are controlled by the Arizona Copper Syndicate.——From the Neversweat, in New York cañon, several cars of copper ore have been shipped.——Two miles northeast of Luning is the Esmeralda Copper Co.'s claim, and a compressor has been ordered, also extensive development.——Luning people are interesting themselves in the Moho district, six miles from Belleville. Some ore is being shipped.

In the report of the Goldfield Consolidated for 1914 reference is made to its subsidiary, the Aurora Consolidated. About 60,000 tons of ore was treated since acquiring the property. This should have yielded a profit of $90,000, but left none, and about $200,000 has been spent in alterations at the mine and mill.

Nye County

The directors of the White Caps Mining Co., of Manhattan, are proposing to shareholders that the incorporation be changed from South Dakota to Nevada, the capital stock be made assessable, and increase the capital to 2,000,000 shares when necessary. The new arrangements generally should broaden the scope of the Company.——The Big Pine company's tube-mill plant is showing a daily capacity of 150 tons, and the recovery is above 90%.——The spring is responsible for many placer properties resuming sluicing.

Tonopah mines produced 10,940 tons of ore, worth $222,880, in the third week of March. Some February returns were as follows: Belmont, 14,397 tons, 2800 oz. gold, 257,369 oz. silver, and $91,453 profit; Jim Butler, 4255 tons, and $22,444 profit; and Tonopah Mining, 10,200 tons, 181,150 oz. bullion, with $47,800 profit.——Promising developments are recorded at 600 and 980 ft. in the Extension and Merger, respectively.

Storey County

According to the superintendent of the Consolidated Virginia Mining Co., T. F. McCormick, the principal work performed in 1914 was on the 2500-ft. level. From certain development there was extracted 1550 tons of $10.15 ore.——It is probable that the Yellow Jacket, Crown Point, and Belcher mines may be consolidated, and the old south end of the Comstock lode reopened. The output of these properties in 1914 was as follows: Yellow Jacket, 23,763 tons, $17,792 net; Crown Point, 10,776 tons, $42,000 gross; and Belcher, 8801 tons, $42,700 gross.

NEW MEXICO

Dona Ana County

The Organ Mountain copper claims have been acquired by the American Smelting & Refining Company.

Socorro County

A new treatment plant worth $150,000 was destroyed by fire at the Calumet in the Black Range district last week.

UTAH

Carbon County

The Ketchum Coal Co.'s mines at Castle Gate were sold to L. R. Eccles, of Ogden, last week, for $200,000. Development has opened about 1,250,000 tons of coal.

Juab County

At 1800 ft. in the Chief Consolidated a good shoot of ore has been developed. Prospecting is still being done by diamond drill.——Mules have been lowered into the Gemini mine to facilitate tramming underground.——Low-grade dumps at the Bullion Beck have been leased to D. R. Goodwin, V. Watkins, and W. L. Anderson, who will erect a plant of four jigs to treat the material.

Summit County

With a 35-ton Holt-Dern roasting furnace installed, the Park City Mills plant is to start on American Flag ore. Theodore P. Holt thinks that 50 tons may be reached with 90% recovery, 85% being guaranteed.

CANADA

Alberta

At 2774 ft. the Alberta Petroleum Consolidated Co. has found oil of high grade. There was 1000 ft. of oil in the well last week.

British Columbia

Early on March 22 a snowslide carried away about half of the buildings at the Britannia copper mine, north of Vancouver. About 100 miners were asleep in a bunk-house, and about 55 of these were killed, and their bodies cannot be recovered until the snow melts.

JEWEL-DENERO MINE AND MILL NEAR GREENWOOD, BRITISH COLUMBIA.

The Union Hydraulic Gold Mining Co. has completed its camp buildings near Vernon, and is installing the sluicing plant. Russell H. Hanauer is in charge.——Production of the Granby properties in January was as follows: Anyox, 1,304,353 lb. copper, 19,053 oz. silver, and 506 oz. gold; and Grand Forks, 775,786 lb., 12,223 oz., and 2019 oz. The net earnings approximated $100,000.

Ontario

Nickel ore shipments from the Alexo mine to the Mond Nickel Co.'s plant at Coniston amounted to 839 tons in February.——The North Thompson mine at Porcupine has been closed temporarily, and the plant has been leased to the Porcupine Gold Mines, whose mine is developing well. A Hardinge ball-mill is being installed in the mill.

The Canadian Copper Co., according to the president, A. D. Miles, will spend $500,000 on a new shaft-house, rock-house, eight workmen's homes, and equipment.

PERSONAL

R. A. F. Penrose, Jr., is at Denver.

A. F. Main, of El Oro, is in New York.

Thomas H. Leggett is at Los Angeles.

Franklin Guiterman is visiting Denver.

T. A. Rickard arrived in San Francisco today.

A. Chester Beatty sails for London on March 27.

Allen H. Rogers is going from New York to Burma.

H. C. P. Woolmer has arrived in London from Russia.

R. M. Atwater is inspecting copper mines in Arizona.

E. G. Spilsbury is returning to New York from Montana.

S. F. Peters, of La Libertad, Nicaragua, is in San Francisco.

H. Foster Bain will leave San Francisco tonight on his way to London.

Charles S. Haley has been at Ludwig, Nevada, on professional work.

John M. Nicol, mining engineer, recently of Mexico City, is in San Francisco.

William Newbrough is now at 229 Monterey avenue, Highland Park, Michigan.

James W. Malcolmson was in San Francisco last week and has returned to Kansas City.

Herbert C. Enos was married to Miss Caroline Nolan on February 16 at Salt Lake City.

P. D. Burt has returned from an examination trip to the Hassayampa district, Arizona.

E. L. Wolcott, assistant secretary of the American Mining Congress, was at Salt Lake City recently.

Utley Wedge has been elected president of the Tennessee Copper Co. to succeed James Phillips, Jr.

S. H. Brockunier, who has been in the East for several months on business, has returned to Nevada City.

Charles A. Banks, of the Jewel-Denora mine, Greenwood, B. C., is in Manitoba examining mining property.

William T. McDonald, formerly superintendent of the Chino mill, is now with the Ray Consolidated at Hayden.

F. S. Janney and D. C. Jackling are making a trip of inspection to Juneau to look over the Alaska Gold operations.

W. H. Bassett has resigned his position as foreman at the Engels Copper Co. at Keddie, California, and has returned to Oakland, California.

R. P. Rogers, of the Coniagas of Cobalt, has accepted the appointment of adjutant of the 37th Battalion, Canadian Overseas Expeditionary Forces.

Roswell H. Johnson, of the firm of geologists of Johnson & Huntley of Pittsburgh, was in Washington this week in connection with the Osage hearing.

A. A. Hassan is examining manganese deposits of Tennessee, West Virginia, and Virginia. Mr. Hassan's temporary address is care of Tennessee Copper Co., Copperhill, Tennessee.

William Campbell has been promoted from associate to professor of metallurgy in Columbia University. E. K. Judd has been similarly promoted to be assistant professor of mining.

E. S. Sheffield, formerly division superintendent of the General Petroleum Co. at Taft, is at present at Chungfu in Shensi, North China, drilling well No. 2 for the Standard Oil Company.

Israel C. White and W. L. Saunders have been appointed members of the Federal Trade Committee of the Chamber of Commerce of the United States, which is to co-operate with the Federal Trade Commission.

E. S. Sheffield, formerly at Taft and McKittrick, California, is now in charge of a crew of California drillers and tool-dressers that is engaged in putting down the first well on the Standard Oil Co.'s concession in the Yen-Chang oilfield, China.

E. E. Hampton, superintendent of the Bunker Hill mine, Amador City, is visiting the southern part of the state for his health. Bayliss C. Clark has taken his place temporarily. This mine has just paid its 105th consecutive monthly dividend.

The following nominations for officers for the year 1916 have been made by the Council of the Geological Society of America: for president, John M. Clarke; for first vice-president, J. P. Iddings; for second vice-president, H. F. Reid; for third vice-president, Rudolph Ruedemann; for secretary, Edmund Otis Hovey; for treasurer, William Bullock Clark; for editor, Joseph Stanley-Brown; for librarian, Frank R. Van Horn; for councilors (1916-1918), F. B. Taylor and C. P. Berkey.

OBITUARY

Peter Peck, one of the best known employees of the Calumet & Hecla Mining Co., died at Calumet, March 9. He was employed by the Calumet & Hecla in various positions for the past 45 years.

Emmanuel Stephens, a well known pioneer resident of the Michigan copper district, died at Osceola March 8. The late Captain Stephens was born in Cornwall, England, 80 years ago. He came to the Lake Superior region in 1857, settling first at the Cliff mine. He worked at various other mines in the copper district and for some years had had charge of mining operations near Ironwood.

Jacob Wilson, one of the pioneer Finnish mining men of Michigan, died at Hancock, March 2. He came to the Michigan copper district from Finland in 1874 and was widely known as a mining authority. For several years he was in charge of operations at the Orijarvi mines of the Finnish-American Mining Co., near Helsingfors, Finland, and returning from Finland only a few years ago, became connected with the Quincy Mining Company.

David W. Culp died February 24 at Rathdrum, Idaho, aged 84 years. He was one of the early pioneers of Deer Lodge county, Montana, going to California in 1853, and was in Idaho during the days of 1863. At the time of the vigilance committee of Montana he went down to Valparaiso, Peru, and arrested the murderers of Magruder; he was one of the guards during their imprisonment and execution at Lewiston, Idaho. He leaves a widow, three sons, and two daughters, and many friends.

Schools and Societies

On March 24, Horace M. Swetland gave the fourth of his lectures on industrial journalism at the New York University.

Affairs at the University of Utah are decidedly unfortunate. On March 18 fourteen professors resigned as the result of the attitude expressed by the board of regents (ten Mormons and two Gentiles) in a public statement regarding the recent dismissal of four professors, and the demotion of the head of the English department. Robert S. Lewis, mining and milling, and W. C. Ebaugh, chemistry, were among those who resigned. The alumni association is preparing a suit for the forfeiture of the charter of the University. The complaint, it is said, will allege that the institution has failed to fulfill the requirements of the act and has become a sectarian institution, dominated by the Mormon church. The Wall scholarship has been withdrawn from the institution.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, March 25.

Antimony	25 —25¾
Electrolytic copper	15½ 15¾
Pig lead	4.40— 5.35
Quicksilver (flask)	$80.00
Spelter	10¾—11
Tin	40 —41½
Zinc-dust, 100-kg. zinc-lined cases	15

EASTERN METAL MARKET

Owing to some delay in transmission our regular telegram of metal prices did not come to hand in time for insertion in this issue.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending	
Mch. 18	50.12	Feb. 10	48.20
" 19	50.50	" 17	48.42
" 20	50.25	" 24	48.70

June	56.43	....	Dec.	49.27	....

The silver market has been featureless during the past week. On March 20 about 230,000 oz. left San Francisco for the Orient. Up to March 4 about 13,000,000 had been shipped to India from London, against 10,000,000 oz. in the same period of 1914. According to Samuel Montagu & Co. of London, quotations neared 23d. several times this year, but as a considerable amount of metal is held back for prices about that limit, quotations receded. Owing to the $10 per $1000 insurance rate to England from Canada, the Nipissing is storing its product at present.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Feb. 24	62.50	Mch. 10	80.00

Tin is easier at 45 to 50c. In London quotations are £168 10s. per ton for spot metal. It is reported that the British government has issued an order forbidding the exportation of pig tin, chloride of tin, and tin ore except under special licenses; also that these permits would only be granted if the shipments were consigned to British consuls at ports of destination. Prices broke considerably on this news being published.

COPPER

Prices of electrolytic in New York, in cents per pound

The Rio Tinto Copper Co. of Spain has declared a dividend of $8.40 per share to cover the whole of 1914.——The Osceola will pay $2 per share on April 30.

Regarding the copper situation the National Conduit & Cable Co. says: "The general tone of the copper market lately was one of underlying strength, and demand from both domestic and foreign sources enabled holders to keep the situation well under steady control. International requirements were of sufficient volume to absorb free deliveries of the metal. The increase in domestic manufacturing operations is in particular evidence, and the home melting of large tonnages monthly is proving an effective factor in sustaining prices around the range recently established of 14¾ to 15c. for electrolytic. The curtailment of the output of copper instituted several months ago strengthened the argument for better market conditions. And on the basis of recent production it has been possible to lift the market to the plane on which it rests at present. It is hardly probable, however, that conditions are favorable enough for an early resumption of output at full capacity. There is more life and activity in business and industry, compared with the state of trade last fall, but more definite indications are necessary to demonstrate the permanency of these encouraging conditions."

LEAD

Lead is quoted in cents per pound or dollars per hundred pounds, New York delivery.

Date.		Average week ending	
Mch. 11	3.95	Feb. 3	3.80
" 12	3.95	" 10	3.80

" 12	8.00	" 10	7.75
" 13	8.00	" 17	8.24
" 14 Sunday		" 24	8.25
" 15	8.00	Mch. 3	9.05
" 16	8.00	" 10	8.00
" 17	8.00	" 17	7.92

Monthly averages.

	1914.	1915.		1914.	1915.
Jan.	5.14	6.30	July	4.75	....
Feb.	5.22	9.05	Aug.	4.45	....
Mch.	5.12	....	Sept.	5.16	....
Apr.	4.98	....	Oct.	4.75	....
May	4.91	....	Nov.	5.01	....
June	4.84	....	Dec.	5.40	....

During the week ended March 13, the Missouri-Kansas-Oklahoma output of ore was 5200 tons, but shipments amounted to 2800 tons, consequently a large surplus is accumulating. In the following week a wide range of price was recorded between high and medium-grade zinc orders, due to the relatively strong demand for the former. Prices were from $65 down to $55 per ton.

COMPANY REPORTS

HOMESTAKE MINING COMPANY

With its great mines, 1020 stamps, sand leaching and filter-pressing plants, and other extensive accessories, this well known South Dakota company in 1914 produced gold worth $6,160,161 from 1,587,774 tons of ore. Of this, $2,210,208 was paid in dividends. In September the Company lost through death its president, James B. Haggin, and superintendent, Thomas J. Grier.

The new superintendent, Richard Blackstone, reported as follows: "Operations of the Company for the year 1914 have been normal, there being no interruption of any kind to continuous operation. The property is in an excellent condition. Ventilation of all workings and safety of employees are closely looked after. The average number of employees was 2350. The principal betterments for the year consist of: A completely equipped central boiler plant of six 600-hp. boilers, an electric generating station having a maximum capacity of 4000 kva., consisting of two units of steam turbines, condensing, direct connected to generators; a compound condensing steam hoist, designed to handle two 6-ton skips from a maximum depth of 4000 ft., skips dumping direct into two No. 8 Gates crushers; and a compound condensing air-compressor, with a capacity of 3000 cu. ft. of free air; the Recreation building, containing a theatre with a seating capacity of 1000, a library, swimming pool, gymnasium, bowling alleys, billiard and amusement rooms, was opened to the public August 31, 1914. The B. & M. shaft was sunk from the 1550 to the 1700-ft. level, and the Golden Star shaft from the 1250 to the 1400-ft. level, while 17,809 ft. of driving was done during the year. Ore reserves in the mine are large and represent many years' supply for the present crushing capacity, and we are now saving 94% of the gold.

SOCIOLOGICAL CONDITIONS AT LEAD, SOUTH DAKOTA; HOW THE HOMESTAKE MINING CO. LOOKS AFTER THE WELFARE OF ITS 2350 EMPLOYEES. RECREATION HALL, BUILT BY THE COMPANY AT A COST OF OVER $250,000.

Assets and liabilities are as follows:

ASSETS

Mines and equipment, etc	$25,116,000
Balance in banks	1,086,530
With superintendent	18,660
Bullion in transit	280,870
Total	$26,502,060

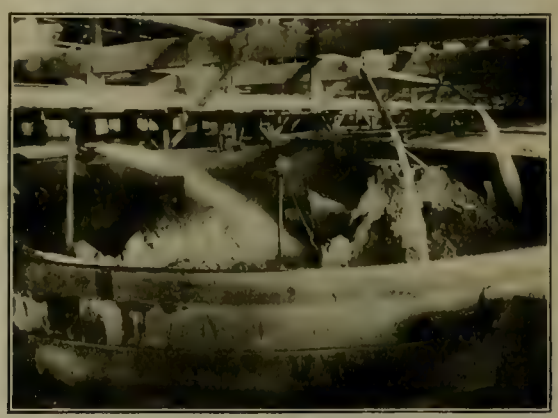
LIABILITIES

Capital stock, 251,160 shares at $100	$25,116,000
Outstanding drafts	$ 181,136
Unclaimed dividends	28
Profit and loss, balance account	87,296
Total	$26,502,060

An analysis of the financial statement would indicate that the full amount of dividends had not been earned, and this might be shown as follows:

Bullion, balance from 1913, and sundry income	$7,776,970
Balance from 1913	1,428,247
Revenue in 1914	$6,308,723
Operating expenses and dividends	6,839,374
Steam power-plant, recreation hall, property purchase, etc.	350,650
Expenditure fairly chargeable to operation	$6,488,724

The new revenue, $6,308,723, compared with the expenditure, $6,488,724, shows that the Company apparently went behind $180,001, although there may be other items of expenditure included in the operating cost which might be fairly chargeable to what is ordinarily carried as capital account.



SLUICING OUT TREATED SAND AT THE HOMESTAKE. THESE VATS HOLD FROM 600 TO 1250 TONS, AND ARE EMPTIED IN ABOUT THREE HOURS.

The year started with a balance of $1,428,248, and ended with one amounting to $897,596.

Costs may be stated as follows, being calculated from the total charges of the various departments:

	Total charge.	Cost per ton.
Aid fund, benefices, recreation hall, hospital, house, etc.	$ 185,466	$0.116
Assay office	30,627	0.019
Shafts	416,518	0.262
Deadwork, débris	51,364	0.032
Foundry, machine shop, smithy, etc.	98,836	0.062
Mine, principal items:	Per ton.	
Labor $1,641,807	$1.033	
Powder 198,321	0.125	
Timber 103,934	0.065	
Total mining charges	2,228,245	1.403
Mills (six)	378,406	0.238
Regrinding	24,289	0.015
Leaching sand	152,664	0.096
Filter-pressing slime	136,878	0.086
Central steam electric power plant (construction)	198,627	0.125
Freight on bullion	9,362	0.006
General expense	95,876	0.060
Legal	8,386	0.005

	Total charge.	Cost per ton.
Lime kiln	5,005	0.003
Office	17,121	0.011
Dividends	2,210,208	1.392
Property purchase	30,896	0.019
Salaries	28,291	0.017
Silver plating	3,768	0.002
Survey	32,579	0.020
Stable	24,857	0.015
Timber lands	83,498	0.053
Timber	9,412	0.006
Tramway	26,962	0.017
Water	66,878	0.042
Taxes	258,962	0.163

The 1,587,774 tons of ore treated averaged $3.879 per ton. Special note should be made of the heavy taxes, 16.3c. per ton.

At the Panama-Pacific Exposition the Company has arranged an exhibit showing a section of the mine, and has a large number of photographs illustrating its many activities.

Book Reviews

CARRANZA AND MEXICO. By Carlo de Fornaro. P. 242. Ill. Mitchell Kennerley, New York. For sale by the *Mining Press*. Price $1.25.

To the student of sociological problems, Mexico is possibly the most interesting spot in the universe. Her problem is so complicated that very few people claim to know what all the trouble is about, and of those opinions voiced as authoritative we are extremely skeptical. An effort, however, which holds up the mirror to even one facet of this extremely complex problem is worthy of note, and it is with this attitude of mind that the present work by Sr. Carlo de Fornaro should be approached. Don Venustiano Carranza, while well known to the Mexican public for many years, was an obscure character to the American people until two years ago when he espoused the cause of Madero and took up arms against the Huerta administration. Since that time his name has been continuously linked with the upheaval which Mexico has experienced, and bids well to continue for some time to come. Carranza, as the governor of the state of Coahuila, from which state the weak successor of Porfirio Diaz came, was the logical leader of the anti-Huerta forces. Although his military genius and peerless leadership were most in evidence at banquet boards in the wake of Francisco Villa's victorious army, he was accepted as the leader of the Constitutionalist cause. While the present work has the atmosphere of a Carranza subsidiary, it presents many interesting facts which are pertinent to the present crisis, and as such will interest the casual student of Mexican affairs. As a history of the present embroglio the work has its chief importance, and its references to Constitutionalist leaders other than those in sympathy with Carranza, and Francisco Villa in particular, are extremely biased. While the opinions of the author are those of the champions of Carranza, those who have followed the career of this first leader of the Constitutionalist cause will find many reasons to differ from Sr. Fornaro, and will note that those qualities and actions which have been so largely accountable for Carranza's decline in power and popularity have been totally neglected.

PETROLEUM INDUSTRY OF CALIFORNIA. Map Folio accompanying *Bulletin* No. 69. By R. P. McLaughlin and C. A. Waring. 17 plates. Issued by the California State Mining Bureau, San Francisco, March 15, 1915. The *Bulletin* is still in the press, and when published, a review of the whole of this valuable investigation will be given. Editorial comment on the Folio appears in this issue.

RECENT PATENTS

1,121,268.—ALUMINUM ALLOY. William A. McAdams, Bay Shore, New York. An aluminum alloy composed of aluminum, silver, zinc, and copper combined substantially in the proportion by weight of 100 parts aluminum, 20 parts silver, 10 parts zinc, and 5 parts copper.

1,121,226.—DRY TREATMENT OF ORES. Wilhelm Buddeus, Charlottenburg, Germany. The treatment of zinc-blende, ore containing blende, and similar metallurgical products, consisting in mixing the finely divided or disintegrated material with a binding agent such as calcium silicate, forming it into briquettes, and roasting the briquettes with fuel in the presence of an air current, and finally directing a burning gas current against the briquettes.

1,120,175.—PROCESS FOR RECOVERING PRECIOUS METALS. Frederick A. Wiswell, Oakland, California. The process consists in subjecting finely divided material containing precious metals in fine particles to the action of an aqueous solution of mercuric chloride, in the presence of a metal which is more readily acted upon by the mercuric chloride than the fine particles of the precious metal, while subjecting the mass to the action of an electric current having its polarity periodically reversed.

1,122,664.—ELECTRIC ZINC FURNACE WITH INTEGRAL CONDENSER. —Charles Victor Thierry and Michel Thierry, Paris, France. In an electric zinc furnace a longitudinally extending bed of carbon resister, a charging pocket or pockets disposed along one of the vertical sides of said resister, a plurality of transversely disposed tubes, filled with carbon which are arranged along the other vertical side of said resister and a space or chamber with which the said tubes communicate.

1,121,002.—MINING-MACHINE. Charles E. Davis, Chicago, Illinois, assignor to Goodman Manufacturing Co., Chicago, Illinois. A mining machine comprising a stationary frame and a movable frame, a motor associated therewith, a mechanism associated with the frames for removing them relatively, a propelling mechanism forming part of the machine for moving the entire machine from place to place, said propelling mechanism normally disconnected from the motor, and means for connecting said propelling mechanism with the motor under predetermined conditions.

1,114,372.—PROCESS OF ROASTING ORES. Frederick Laist, Anaconda, Montana. In the treatment of ores and other material, the process of subjecting a charge of the ore while traversing a treatment chamber to the action of hot reaction-supporting gases, introducing said gases in a direction conforming to the general direction of movement of the ore in said chamber to prevent overheating of the charge, removing the resulting hot calcines from the influence of the said gases, completing the treatment of the calcines thus removed, without further application of heat and conducting the gases from the final treatment to the charge traversing the treatment chamber aforesaid.

1,121,985.—PLACER-MINING MACHINE. Arthur E. Custer, Salt Lake City, Utah. In a placer-mining machine the combination of an inclined sluice-box; a plurality of pyramidically shaped tanks forming a bottom in said sluice-box; a screen in said sluice-box forming a foraminous covering for said tanks; a valve-controlled pipe in the bottom of each of said tanks; a riffle sluice suspended below and inclined in the same direction with said sluice-box; and a nose piece on the lower end of each of said pipes and spaced along said sluice-box, and adapted to deliver progressively finer grades of material at successive spaced parts of said riffle sluice from its head to its discharge end.

MINING DECISIONS

Possession of Minerals—Presumption

A possession under general warranty deed of a tract of land is possession of the surface and the minerals below the surface, unless the minerals have previously been separated from the ownership of the surface by prior conveyance.

Big Sandy Co. *v.* Ramey (Kentucky), 172 Southwestern, 508. January 20, 1915.

Coal Lease—Guaranteed Tonnage Clause Construed

A coal lease contained a provision for the payment of a flat rental for a stipulated number of tons of coal to be mined each year, and for making up deficiencies in such annual tonnage within six years after they should occur. Held, that the stipulated number of tons must be mined in a given year before any part of the tonnage mined in that year could be applied on the deficiency for preceding years, so as to stop the running of interest on the royalties due on such deficit.

Hodgdon *v.* Lehigh and Wilkes-Barre Coal Co. (Pennsylvania), 92 Atlantic, 752. October 5, 1914.

Oil Lease—Contract Vitiated by Fraud

Assignees of an oil lease who have induced third parties to enter into a contract for a part interest in the lease upon representations that the royalty under the lease was 20%, whereas a matter of fact said assignees were under obligation to pay the original lessees from whom they had taken their assignment an additional 10%, making 30% in all, have not acted in good faith toward such third parties, and the contract may be rescinded upon suit of the latter.

Glass *v.* Templeton (Missouri), 170 Southwestern, 665. November 27, 1914.

Trespass on Vein Owned by Another—Damages

In case of an innocent trespass in a mine where the trespasser sells the finished product of metalliferous ores, the measure of damages is the gross value of the ores in the mine before removal, and this may be ascertained by deducting from the gross proceeds or value of the finished product the cost of making the product at the time of conversion. Where the trespass is wilful, however, the measure of damages is the gross proceeds of the ore without any deduction for mining or milling.

Liberty Bell Gold Mining Co. *v.* Moorhead Mining & Milling Co. (Colorado), 145 Pacific, 686, January 4, 1915.

Alaska Coal Lands—Opening and Improving Mine

The discovery of an outcrop of coal on a tract of land does not constitute the opening and improving of a mine thereon within the meaning of Section 1 of the Act of April 28, 1909, providing "that any person or association of persons qualified to make entry under the coal land laws of the United States, who shall have opened or improved a coal mine or coal mines on any of the unsurveyed public lands of the United States in the district of Alaska, may locate the lands upon which such mine or mines are situated." No right of location and entry under said act is acquired by merely discovering an outcrop of coal, staking the claim, recording the notice of location, and applying for patent.

John L. Long (Land Department), 43 Land Decisions, 305. May 27, 1914.

Clay Deposits—Not Subject to Mineral Patent

In a placer patent application, where the land described was in conflict with a prior railroad grant, the only showing of mineral value was based on deposits of shale shown to contain varying percentages of silica, alumina, iron oxide, calcium carbonate, and limestone, whose only suggested use was for the manufacture of portland cement. Held, that on account of the wide distribution of this clay, the small proportion its value bears to the cost of manufacturing cement, and its dependence for being used on various artificial conditions, it is not a mineral deposit such as would warrant the withholding of a tract on which it occurs from disposition under a railroad grant or patenting it under the mineral laws.

Victor Portland Cement Co. *v.* Southern Pacific Railway Co. (Land Department), 43 Land Decisions, 325. June 6, 1914.

Extralateral Right Not Sustained

In a suit involving the ownership of certain orebodies lying within the vertical boundaries of a patented claim, the Ontario, the plaintiff attempted to prove an extralateral right therein covering said orebodies, basing its claim to such an extralateral on an alleged contact between the secondary vein in the adjacent Stewart Fraction claim and a well defined fault, causing the said secondary vein, which entered the Stewart Fraction through a side-line, to turn and pass out through an end-line. The court found, however, that the vein was cut off by this fault and did not turn and pass out through the end-line as alleged. Held, that this finding precluded complainant from basing any extralateral right on the secondary vein; in other words, a secondary vein, entering the claim through one side-line and terminating within the claim does not entitle its owners to an extralateral right on its dip. Hence, the orebodies lying within the vertical boundaries of the Ontario presumptively belonged to the owner of that claim.

Stewart Mining Co. *v.* Bourne (Idaho), 218 Federal, 327. November 2, 1914.

Placer Patents—Exception of Known Lodes

Where a placer patent was applied for on mineral ground near Butte, Montana, in 1879, and at the time when the application was made the only evidence of a 'known lode' within the boundaries of the claim was indications of a possible lode of possible mineral value in the form of prospect holes and float quartz and disintegrated outcrop, this evidence was insufficient to justify a decree excepting a lode subsequently discovered to be of value from operation of the placer patent. The general exception in a placer patent of "any lode known or claimed to exist when the patent was applied for," even though it be not defined is without warrant of law. The burden is always on the lode claimant seeking to locate subsequently to the grant of the placer patent to prove that his lode was known to exist at the time the placer patent was applied for. Such proof must show that at said time the lode was clearly ascertained and defined, and of such known extent and content that, in view of all circumstances and conditions affecting its worth, such as the importance locally attached to like lodes under similar conditions, ease or difficulty of development, facilities for ore treating, cost of mining and reducing ores, reasonable probabilities of development, and the like, it would then have justified location, development, and exploitation, and because of which it and the area attaching to or excluded with it were valuable, and more valuable than for placer mining purposes.

Clark Montana Realty Co. *v.* Ferguson (Montana), 218 Federal, 959. December 31, 1914.

Note.—This case goes further than most decisions in upholding the title of a placer patentee to lodes within his ground, and is difficult to reconcile with the theory that known lodes are altogether excepted from a placer patent and are subject to subsequent disposition by the Land Department under the lode law.

New Machines and Devices

Severe Tests for an Auto-Truck

Unusual demonstrations of load carrying and traction power have been given recently to dealers and visitors at the factory of the Thomas B. Jeffery Co., Kenosha, Wisconsin, where the new Jeffery 'Quad' or four-wheel drive truck is being manufactured. Some of these tests are very unusual, one of which is that of climbing a pile of lumber in which the heavy planks are arranged to provide steps respectively 4, 8, and 12 in. high. The angle of the slope is 49%, which represents an angle of 44.1°. The total weight of the truck, load, and operator used in this test is 8950 lb. The hay with which the truck is loaded weighs 3250 lb. Another severe test is given in which the truck has to pull itself out of a deep ditch.

Mine-Rescue Parties Telephone to the Surface

Devising ways and means for protecting human life in mines is probably the most prominent question before both mining operators and the government. The laws of practically every mining state now include statutes calling for regular inspections of all mines, and contain many safety regulations, which are being rigidly enforced. Not the least among these requirements is a law in a great many of the states compelling the use of telephones underground. The need of mine telephones is so obvious as not to require comment, and every important property in the world could not be operated conveniently without them.

During the past few years the Western Electric Co. has furnished several thousands of its No. 1336 mine telephones for use underground. Through this association with the U. S. Bureau of Mines and the prominent mining companies, attention has been directed to the urgent need for some means of communication between the advance or rescue party equipped with oxygen apparatus, and the rear party outside the mine. Careful consideration will convince anyone familiar with rescue work that a simple reliable equipment providing instant and continuous communication between the rescue party and the rear will be of great value. In the past many losses of life have occurred to members of rescue parties, which unquestionably could have been prevented if there had been some means of communicating with the rear, advising the need of aid, which easily could have been given. Another feature of importance is that such an intimate and constant communication with another human being on the outside encourages the rescuer far underground and prevents those sudden waves of overpowering fear that everyone more or less is subject to in times of great danger, particularly when in darkness and alone. Realizing the need of an equipment as above mentioned, the Western Electric Co. has, in spite of many difficulties, succeeded in producing a light, serviceable, and extremely simple telephoning equipment for use in rescue work. In developing this apparatus, the Bureau of Mines has been frequently consulted, and mine-rescue equipment can now be supplied which will fulfill every requirement of this specially severe service. As the man equipped with an oxygen helmet, which covers his mouth, cannot use the ordinary type of telephone transmitter, a special transmitter, known as the throat transmitter, has been developed, which is the only type of instrument that will satisfactorily meet the special requirements of rescue service. This transmitter is light and compact, and is provided with a soft rubber cup designed to be held firmly against the throat. A light pigskin harness is used to hold the receiver and transmitter firmly in position and in such a manner as not to interfere with any type of oxygen apparatus now on the market. The throat transmitter has been found by actual test to be entirely satisfactory, and to transmit speech practically as well as the standard Bell instrument.

The telephone equipment used by the man on the outside or at the rear, is a Western Electric standard switchboard operator's set, which consists of a chest-type transmitter and head-band receiver. The method of keeping the advance party connected up with the rear is accomplished through a small wire cable consisting of two copper conductors insulated with Western Electric black elastic enamel and two servings of silk, all covered over with a stout linen braid impregnated

MINE-RESCUE 'PHONE SET IN ACTUAL USE.

with a moisture-resisting compound. This wire is furnished in 500-ft. coils and is carried in a leather case fastened to the helmet-man's belt, and pays out as he advances. One end of this coil is equipped with an aluminum-encased plug and is connected with the head telephone equipment by means of an aluminum-encased jack. The other end of the coil is equipped with a similar jack, which connects with a plug and cord running to a battery and apparatus box. As the wire coils are of light weight (2 lb. 7 oz. each), several of them can be carried along by the rescue party, and as soon as one is run out, another can be connected in by means of the plugs and jacks, and the party proceed another 500 ft., and so on. Due to the special winding of these coils, it is not feasible for the mining company to rewind the wire once paid out, but as they are of comparatively low cost, a stock of them should be kept on hand by the rescue crew. The total weight of the equipment carried by the rescuer, including the head telephone apparatus, belt, leather coil, and one coil of wire, is only 5 lb. 4 oz. The battery and apparatus box is always a necessary part of the equipment and must be placed at the point where the person who is directing the rescue work from the rear, by means of the telephone, is stationed. It contains eight dry batteries mounted in a Patterson (screw type) battery holder, and a No. 466 key,

two jacks, and a battery gage mounted in a separate compartment fitted with handles and easily lifted out.

In many cases it will be found desirable to use cable for carrying the circuit down a shaft or into a slope mine up to the edge of the danger zone. For this purpose the large box and cable reel is furnished. It consists of a heavily reinforced, metal-bound, mortise-cornered box made of ash and containing an aluminum reel on which is 1300 ft. of special, stranded twisted paired, rubber covered and braided cable. The cable is flexible and strong. The rubber insulation is composed of 30% pure Para rubber.

The accompanying illustration shows the complete outfit, which is now a part of the U. S. Bureau of Mines exhibit in the Palace of Mines and Metallurgy at the Panama-Pacific Exposition. This particular one is the most advanced of others being tested.

In the 'mine' in the Mines Building, the Western Electric Co. has standard telephone equipments, and desk instrument in the superintendent's office. In the Varied Industries Building the Company has its main display, consisting of a complete lay-out of railway telephones and dispatcher's desk for trains, sectional-unit switchboards, bells and enunciators, riot bells, fire alarms, mechanical signaling sets, by which certain signals are given for each superintendent on a mine or mill wherever he may be, loud-speaking 'phones or announcers, and a variety of other apparatus, installed by A. G. Kingman, of the New York office, who was in charge from the end of December to March 8. Two prominent features of the exhibit are an immense telephone several feet high, and reels of armored cable.

Commercial Paragraphs

The Excavating Engineer for March contains varied information on the work of Bucyrus steam-shovels, such as basement excavation, construction of a reinforced concrete dam in Ontario, eight shovels at the Nevada Consolidated Copper Co.'s mine, and a lot of field notes.

W. C. Green, well known to the western mining trade for the past 25 years, and during the past six years representative of the mechanical goods department of the DIAMOND RUBBER CO., died February 13, from an attack of pneumonia. Mr. Green's work for the Company will be carried on by C. A. Tracy.

The HOLT MANUFACTURING CO., of Stockton, California, in its publication, *The Caterpillar Times*, for February, describes the firm's exhibit at the Exposition. In a future issue of the *Press* the display will be fully discussed. *Bulletin* H58 covers the Holt harvesters, specifications and cost of operation in the field.

T. A. Bennett, who for the past five years has had charge of the conveyor and elevator belt sales of the B. F. GOODRICH CO., Akron, Ohio, severed his connection with the Company March 1, to become the assistant to the general sales manager of the New Jersey Zinc Co., with offices in New York. Mr. Bennett will be succeeded by J. D. Mooney, formerly special mining representative for the Goodrich company.

The CALIFORNIA ORE TESTING CO., of San Francisco, has added a 2 by 6-ft. tube-mill to operate in combination with a battery of three 350-lb. stamps for all-sliming tests, or in combination with the five 1050-lb. stamps, or dry-crushing plant, for part regrinding. This unit has proved itself efficient in corroborating exact large-scale operations, and also in reducing tungsten ores on a fairly large scale.

The MARION STEAM SHOVEL CO., of Marion, Ohio, which manufactures railroad and revolving steam-shovels, electric and traction shovels, dipper, elevator and hydraulic dredges, scraper-bucket, clam-shell and orange-peel excavators, ballast and other unloaders, has published a 29-page booklet on 'Digging and Mixing Clay,' one operation. The work is well illustrated, and three blueprints give tables of specifications of standard models which are drawn to scale on these pages.

The WOOD DRILL WORKS, Paterson, New Jersey, has sent us several leaflets briefly describing its products. The new model No. 5 rock-drill is an improvement on the 3⅝-in. machine for large engineering undertakings, and has a capacity of 50 ft., finishing with a 4-in. hole, instead of 35 ft. and 3⅝ in. The machine has been thoroughly tested, being used in the hardest trap-rock for the past three years with great success. Some notes are given on hose couplings and menders.

In *Bulletin* E-35, superseding E-30, the CHICAGO PNEUMATIC TOOL CO. describes its 'Universal' electric drills operating on direct or alternating current. These were patented February 18, 1913. This feature of being able to use varied power is of great value to contractors and others, who may find it necessary to do work in districts which may be supplied with either current. Seven sizes of drills are made, adapted for drilling holes in metal from ⅞ to 1¼-in. diameter. No. 3 S S will drill up to 2¼-in. holes in wood. They weigh from 4¾ to 54 lb.—— The No. 11 Boyer riveting hammer is described on *Form* No. 212. This hammer is useful for expanding superheater flues and for other work. It will drive up to 1½-in. rivets.

Tests made on one of its 500-hp. Diesel-type engines are tabulated in a communication from the MCINTOSH & SEYMOUR CORPORATION, maker of Diesel-type oil-engines and steam-engines, at Auburn, New York. The oil used, from the Indian Refining Co., was of 33°B. gravity, having a heat value of 19,266 B.t.u. per pound. Five tests were made on January 11, showing the following results:

	No. 1.	No. 5.
Time of test, hour	0.5	0.5
Load, per cent	113.4	25.2
Speed, revolutions per minute	171	170
Brake horse-power	567	126
Oil consumption per hour, pounds	230	82.2
Oil consumption per b-hp.-hour, pounds	0.495	0.652

The LINK-BELT CO., of Chicago, in *Bulletin* 207 discusses its 'Link-Belt' electric hoist. This machine may be used where a slow hand-chain block, on a crank or elsewhere, only could be employed. The cut steel gears run in oil; a dynamic braking system is used, the descending load drives the hoist motor as a generator and uses it as a brake; a powerful solenoid brake automatically holds the load when current is interrupted, the hoisting cable can be replaced in 10 minutes; and the hoist is claimed to be quite safe. The whole is enclosed in a neat case. The one illustrated has a 4-ton capacity.—— In *Bulletin* 212 this Company describes its 'Wendell' centrifugal coal drier. Actual results at an Alabama coal mine show that 30 to 40% moisture in coal is reduced to 8% for the ovens.

The CAMBRIA STEEL CO., of Johnstown, Pennsylvania, has issued a 41-page bulletin on the 'Slick' mine ties. These were patented January 19, 1915, being the result of experiments to produce a metal cross-tie for mine and industrial railroads, as a substitute for wooden ties which are not conveniently available in quantity and at reasonable prices. The 'Slick' tie is of rolled steel section, light and strong, the necessary rail fastenings are always in place and cannot be lost. Track laying is quickly and cheaply done. A complete 36-in. gage medium-weight tie weighs about 10 lb. In dry places these ties should last 10 years, wet places not so long, but they may be coated for protection against water or sulphur. More head room in mine drifts is given than with wooden ties. They are convenient for extending tracks, and they are popular with miners in Pennsylvania. Twenty pages of the publication deals with weights and dimensions of ties and rails. At the Panama-Pacific Exposition the Cambria Steel Co. has an excellent exhibit of its steel products on view, including samples of the 'Slick' mine ties.

LEAVING CAMP

THE passing of the dog-sled and the coming of the railway means much to the great interior mining regions of Alaska. This railroad, to be built by the Government, will leave the coast at Seward and traverse the Susitna valley, across the Broad pass, to Nenana on the Tanana river, with a branch to Nulato on the Yukon. The subject is discussed in this issue.

ON THE VALDEZ TRAIL IN WINTER

MINING PRESS

Established May 24, 1860, as **The Scientific Press;** name changed October 20 of the same year to **Mining and Scientific Press;** shortened January 2, 1915, to **Mining Press.** Controlled by T. A. Rickard.

Published weekly at 420 Market street, San Francisco, by the Dewey Publishing Co., C. T. Hutchinson, manager. Entered at the San Francisco post-office as second-class matter. Cable address, Pertusola.

Branch Offices—Chicago, 300 Fisher Bdg.; New York, 1308-10 Woolworth Bdg.; London, The Mining Magazine, Salisbury House, E. C., London. Cable address, Oligoclase.

Price, 10 cents the copy. Annual subscription: United States and Mexico, $3; Canada, $4; other countries in postal union, 21s, or $5.

Issued Every Saturday
$3 per Year—10 Cents per Copy

ARTICLES

WHAT MINE SUPPLIES SHOULD COST.

By B. J. Silbert, with preface by the Editor....508-542

A comprehensive effort by the purchasing agent of the Tigre Mining Co., S. A., Esqueda, Sonora, to set forth the kind, amounts, and cost of the mine supplies purchased by that Company, as a preliminary step toward greater economy of effort by purchasers and sellers.

MINING NITRATES IN CHILE.

By John G. Beck..... 510

Methods pursued in Chile for the mining of *caliche* and the recovery of nitrates from it are in many instances crude. Notable improvements have been effected by the use of modern equipment at the property owned by the du Pont Nitrate Company.

ORIGIN OF OOLITES AND OOLITIC TEXTURE IN ROCKS..... 514

A summary of the investigations made by Thomas C. Brown on these interesting and important deposits.

SOME PROBLEMS IN COPPER LEACHING.

By L. D. Ricketts..... 515

Various methods have been studied, and Mr. Ricketts concludes that dilute sulphuric acid will give a high extraction from material less than 6 mm. cube. Precipitation can be done with iron at a profit, but electrolysis is preferable and practicable. The best method appears to be the use of SO_2 in electrolysis, without control of the iron content of the solution. Cost estimates are given.

SOME USES OF TRAVERSE TABLES.

By James Underhill..... 519

Traverse tables can be applied for a variety of purposes other than those for which they are ordinarily employed. A prominent authority on mineral-land surveying gives some examples of such uses.

AUSTRALIAN GOLD PRODUCTION IN 1914..... 520

MINING AT SANTA BARBARA.

By F. J. DeWilde..... 521

Shrinkage stoping is used in those veins of this part of the Parral district that are wide enough. In narrow portions of the veins underhand stoping is employed.

SWEDISH IRON ORE AND STEEL AT THE EXPOSITION..... 522

Sweden is an important mineral-producing country and has properly made an important exhibit at the Panama-Pacific International Exposition, in which the iron deposits, electric smelting industries, and the manufacture of steel products are well displayed.

FLOTATION: ITS SPHERE OF USEFULNESS IN GOLD METALLURGY.

By W. B. Blyth..... 523

Flotation has already become an important method in the metallurgy of the precious metals. Some of the considerations governing its use are here set forth.

PROFITABLE USE FOR OLD HAMMER DRILL..... 523

An ingenious way of making otherwise useless equipment serve a useful purpose.

CENTRIFUGAL *v.* RECIPROCATING PUMPS..... 524

A concise summary of the reasons why centrifugal pumps were chosen for the pumping plant at the Durban Roodepoort Deep mine instead of reciprocating pumps.

COSTS AT THE WASP NO. 2 MINE..... 524

Detailed figures as to operating costs at a new mine in the Black Hills, South Dakota, which has made an excellent record.

DEPARTMENTS

DISCUSSION:

Who Will Engineer the Engineers?
By Clyde M. Becker..... 525

A protest from a married engineer against opinions expressed by earlier correspondents.

Practical Points on Sampling.
By Wilson W. Hughes..... 525

A valuable suggestion as to how the cutting of a standard volume in sampling may be easily performed.

The Copper Beds of Coeur d'Alene.
By George Huston..... 525

A reply to criticism, including an attack on 'highbrow' geologists.

Electric Smelting at Tyssedal.
By Robert M. Keeney..... 527

A concise statement of the results attained in this interesting Norwegian plant.

OUR London correspondent apologizes for mentioning the matter of a dinner in war-time; that only applies to those not at the front.

OFFICIAL announcement has been made by the Bureau of Mines that the cost of production of the 300 milligrams of radium bromide it has so far made was at the rate of $60,000 per gram, a marked reduction from the prices formerly prevailing in the open market.

AMONG the casualties of the war, we have to record the death of Leon Chester Thresher, a passenger on the steamship *Fabala*, which was sunk by a German submarine on March 29. Mr. Thresher was an American engineer on his way to the Broomassie mine, in West Africa; born in Massachusetts, he was well known on the Pacific coast, where he was educated.

FORCED loans are being assessed by the Villa government. Among companies recently mulcted may be mentioned, with the amounts, Amparo Mining Company, ₱150,000; Cinco Minas, ₱100,000; El Favor, ₱20,000; Mololoa, ₱10,000; Espado, ₱2000; Casados, ₱5000; Chapala Electric Company, ₱250,000; Bank of Londres & Mexico, ₱150,000; Bank of Jalisco, ₱100,000. While this is only an incomplete list from one locality, it will serve to indicate conditions fairly common in Mexico at present.

SNOW-SLIDES are an ever-present menace to mining operations in regions of heavy precipitation. This is recognized by operators, who take care usually to place their buildings and mine openings in situations where the topography of the surface renders slides improbable. The great danger lies in the circumstance that under unusual conditions slides sometimes take place at points where they have never previously been known to occur. The great slide which occurred at the Britannia mine, in British Columbia, a short time ago, causing the loss of many lives, was of this nature. More details of the catastrophe are given on another page.

RUMOR says that Carranza is to evacuate Mexico City and that Obregon is to re-occupy it. Apparently the contents of the treasury have ceased to be interesting and pickings are better outside the capital. Carranza and Villa are fighting over Matamoros, to the imminent danger of peaceful spectators across the international border at Brownsville. The military operations are on an insignificant scale, but it is possible that the immediate result may exert a wide political influence. It looks as if Mexican affairs would have to become worse before they can be better.

AN unusual phase of the present period of prosperity in the Joplin district is the circulation by the Lyon Investment Company, a local concern, of a letter cautioning investors against a repetition of the wild-cat speculation and over-capitalization period that followed the high prices of 1899. Anyone who was familiar with the district in the years succeeding that orgy of high prices will hope that the warning will be heeded. There is much money to be made out of zinc mining. It is a most excellent business when approached in a business-like manner, but the small uncertain mines from which much of the money made at Joplin has come, are not suited to stock ownership, and periods of exceptional prices, such as the present, are inevitably followed by others of depression.

STATE-MANAGED liability insurance has been a success in California, according to a report which the State Insurance Fund has just made public. The operating expenses of the Fund, other than claims, amounted to 8 per cent of the total premiums during 1914, the lowest record ever made in state-managed insurance, and 15 per cent of the premiums collected is being returned to all policy-holders, except those who paid the minimum premium. During the year the Fund wrote net premiums amounting to $547,000, and now has an unapportioned surplus of 28 per cent, that will be returned to the policy-holders when the excess of legal reserves over actual losses has been determined and withdrawn. The officers of the Fund deserve great credit for the capable way in which they have managed its business.

ALASKA RAILROAD

At the time of writing, no official announcement has been made regarding the proposed route for the Government railroad linking the Yukon basin with the Pacific coast, or 'the outside,' as the 'sourdoughs' call it. The interest of the subject, however, warrants us in making a forecast based on unofficial surmises. It appears likely that Seward will be the terminus on the coast and that the line will run across the Kenai peninsula to Knik, on the estuary of that name, thence along the Susitna val-

ley, across the coast range at the Broad pass, down the Nenana river to its confluence with the Tanana, at the settlement of Nenana, situated a short distance below Fairbanks, the chief distributing point for the Tanana watershed. A branch railroad will be extended from Knik to the Matanuska coalfield and a longer extension will be made from Mile 187 through the Kuskokwim mining district to Nulato, the old trading-post on the Yukon itself. This will involve the purchase by the Government of the Alaska Northern Railroad, from Seward to Knik, about 70 miles, the price stated being $1,150,000. On the other hand, it would appear that the Copper River & Northwestern Railroad, owned by the Morgan-Guggenheim interests, is not to be acquired. The latter railroad has been the subject of a lurid chapter in Alaskan history and a cause of contention from its very inception. Apparently the engineering commission advising the Government has found the line unsuitable, on account of the long stretch of threatening glaciers along which it makes a precarious way into the coast range. Our own knowledge of the region indicates that the route selected by the Government commission is the proper one. We hope that the selection presages an immediate construction of the railway itself, which will serve several important mining districts, producing coal, copper, and gold, and will become the main artery of commerce to a vast mineral region in the North.

The ordinary man does not realize the bigness of this region because he sees it on small-scale maps, usually that of North America. Alaska covers an area of 590,000 square miles. From Skagway to Nome, by the Yukon, is 2275 miles. So far, only the rim of this territory has been tapped by two or three little railways, the bulk of the traffic going by water along devious routes. As a mineral region it is of growing importance, having long ago made ridiculous the price of $7,200,000 paid for it in 1867 by the United States to Russia. The annual output of gold alone exceeds twice the original price.

COPPER

The predominant feature of the copper metal-market during the past two years has been the excellent control of the producers. To this there has now been added the complete control of the export trade by the British Government. The exporters of copper have been exceedingly busy men, not only during the months preceding the war, when demand was at a high level, but since hostilities began, when it became necessary for them to enter the field of international diplomacy. The right of search, which Great Britain has always claimed to hold, sprang into immediate importance when it became a part of Britain's campaign to keep copper from finding its way into Germany. Today practically every shipment of copper is approved by representatives of the English government before it leaves our ports. In consequence, England and the neutral nations of Europe are taking all of our export copper. Theoretically, Germany can import copper on the same terms, whenever it can secure such control of the sea as will make it possible for shipments to get through to that country. The striking thing about the recent arrangements as to copper shipments is the fact that the State Department was apparently unable or unwilling to help the shippers out of their dilemma and, as an alternative, consented to the shippers taking the matter up directly with the English representatives. All of which goes to prove the statements that have been made as to the versatility of the men who handle the producers' end of the copper metal-market. Exports are now moving smoothly and without a hitch. In the meantime domestic deliveries have moved up to record figures, though it is impracticable to get at them with the same exactness that was possible when the Producers Association gave out its compilations. Wire-mills are said to have come into the market in the past two weeks, while the demand for brass, for war munitions of one kind and another, grows larger as plants are getting into operation. Many of the factories in the Connecticut valley are just beginning to turn out work under new contracts, and the whole of the lower part of New England is busy making war supplies. It is said, although it cannot be confirmed, that sales of Lake copper were made last week at 17 cents; electrolytic was quoted at 15¼ cents, with a tendency toward further advance.

THE PASSING OF THE PIONEER

In 1914 the mining profession lost by death five men who had been peculiarly influential in the great development of mining in the Western States that has marked the period since the close of the Civil War. They stood as the representatives of two great currents of capital that were at once the cause and the effect of the large-scale gold-silver mining which has characterized the period and region. Associated with them were others, most of whom had gone before, and a few hale and hearty veterans who seem to have found the secret of perpetual youth. Of the five who died in 1914, three were native-born Americans and two were immigrants, one from Prussia and one from Canada. All were staunch in their Americanism, but cosmopolitan, as befits a miner, in their technology. James B. Haggin was a country lawyer who became a great mine-owner. Louis Janin was the trained engineer on whose judgment the capitalist took or refused properties. Thomas J. Grier was a telegraph operator who became a great mine-manager working for the Haggin-Hearst group. Samuel B. Christy was an instructor in chemistry who became the head of a great mining school, largely supported with money from mines approved by Janin, managed by Grier, and owned by the widow of Haggin's business partner. These men were bound together by personal and professional ties, and they represented a typical American group; the shrewd trader who foresees and stimulates the development of natural resources but confirms his judgment with the best the profession affords, the practical operator who builds

up a great enterprise, and the scholar who passes on to the succeeding generation the best of the technology developed in connection with this work. The Haggin-Hearst combination was one that made its money out of the ground. The men at the head were primarily miners of ore, not manipulators of stocks. They took the legitimate chances of mining boldly for themselves, sharing risks and profits honestly with a few friends; they scored many successes and had their share of failures. All over the West the scout of today finds the marks on the trail made by these pioneers. It is interesting to note that, in the difficult market-days of last August, shares in the Homestake Gold Mining Company were among the few that scored a rise, and that, with the same dividend rate, the shares have recently sold above United States Steel preferred. These pioneers not only hunted out the best opportunities, but they built well on what they found.

The second group represented among the men who died in 1914 was the Exploration Company of London, of which Henry Bratnober was long a field-agent. Associated with him were Alfred Wartenweiler, who died in 1912, and, less closely, Mr. Henry Callahan, who fortunately is still among us with judgment keen as ever and spirit untouched by age. At the head of this group was first Hamilton Smith and later Mr. R. T. Bayliss, who still, in London, maintains an honorable and influential tradition in mining. Of the many others affiliated with these men, there is not here space to speak. It was a notable group, changing from time to time as such groups do, but through long years Bayliss stood at the head and Bratnober scouted the field. In contrast with the Haggin-Hearst combination, the Exploration company worked with public capital and depended on the market. It, however, put money into mining, developed successful mines, and made large and legitimate profits. In the United States it was the pioneer in bringing foreign capital to mining which previously had been considered too speculative.

We have already printed brief sketches of Wartenweiler, Bratnober, Haggin, and Grier, and editorial references to Janin and Christy. The group as a whole was a notable one, and any complete account of their careers would resolve itself into a history of mining through the last half-century. It would be difficult to say which among the men listed played the most influential part. Bratnober, as superintendent at the Drumlummon, gave English investors faith in the stability of American mines, and his memorable tramp alone from Dawson City to bring news of the Klondike is part of the history of the Far North. Louis Janin, perhaps the most distinguished of the distinguished brotherhood of Janins, brought sound learning from Freiberg to the Comstock, and to various other districts in western North America. He was the engineer on whose report Haggin and Hearst bought the Homestake mine, and he scored other great successes as well. One of the gay Bohemian crowd of the old San Francisco, he valued life more than money, and while always hardworking and sound in his technology, never was drawn into the scramble for dollars. Haggin amassed a large fortune and to the day of his death was an active factor in many widely scattered enterprises. Grier worked long years faithfully, and he built unobtrusively but well. It was our great pleasure shortly before his death to record the singularly strong commendation passed upon his work by the Commission that has been investigating industrial conditions throughout the United States. This was all the more welcome, since bitter partisan criticism had been heaped upon him; the not unnatural result of the fight that he waged, without troops, without riots, and almost without accidents, against the Western Federation of Labor and which resulted in the marked defeat of the Federation.

Christy stood somewhat aside from the active field in which these other men worked. With the rare exception of the few times when he advised regarding metallurgical matters in law cases, he devoted his long career exclusively to the College of Mines of which he was the head. From the time that he graduated in 1874 to the day of his death he was connected with the College. He was placed in charge in 1879, and it was his good fortune to have the planning and furnishing of the Hearst mining building, the granite structure that commemorates the pioneer miner whose name it bears. Christy was devoted to teaching, but found time for investigation of the genesis and treatment of quicksilver ores, for studies of chlorination, and for original work in cyanidation. Most of his time, however, was devoted to his students, and no one can read the long roll of names of men who have made good in mining around the world without feeling that his influence was deep and far-reaching. Mr. Charles Butters, who was in the first class graduated under Christy's instruction, has said: "If I were asked to name the most prominent quality in his character, I should say it was his deadly earnestness." He has also related, as illustrating his helpfulness to former students, how Christy made an all-night journey to Kennett to take Butters from laying a pipe in a ditch in the midst of rain and mud, and sent him off to Africa and the brilliant career that we all now know.

The pioneers are passing. Hard-headed, rough-handed, practical men who became great leaders of industry; scouts, capitalists, engineers, and teachers; they are going one by one. Soon the early days of mining—and Mr. Hennen Jennings has made it clear that mining as we now know it is essentially modern—will be known to us only by tradition and through writings. Already the young men are becoming old men, and the radicals of yesterday are the conservatives of today. But mining itself is always young. Always there are veins to be explored, orebodies to be found, and mines to be opened; always problems to be solved and processes to be developed. Our predecessors did their part. It is left to each generation in turn to pioneer for the next.

What Mine Supplies Should Cost

By B. J. SILBERT

[In order that the full significance of the data that Mr. Silbert has compiled with great care shall not fail of appreciation, it will be well to point out in some detail the reasons why such a compilation as this is of great value to both the seller and the buyer. Each of them is apt to fail to appreciate how closely his own interest is linked with the interest of the other. Every man knows that a special job is exceedingly expensive, and that whenever an article becomes standardized its cost is greatly decreased, but the full ramifications of this idea are not generally appreciated. The great variety of materials which a mining company purchases is well brought out in the cost sheets given farther on, and may be indicated by the fact that purchases were made from 361 firms, including such diverse industries as makers of billiard tables, tent manufacturers, book publishers, optical instrument makers, and paint manufacturers. Many of these purchases only involve comparatively small sums and may not therefore be regarded as of importance. Nothing could be farther from the truth, for the aggregate of these purchases amounts to a large sum and is of importance. Every purchaser is anxious to save $500 on a single $5000 order; it is just as profitable to save $500 on a multitude of orders aggregating $5000. The reply will at once be made that the amount of attention and correspondence required to save a dollar on a small order is not worth while, but the point is overlooked that with a proper co-ordination of buyer and seller the necessity for most of this trouble on the part of the purchaser would not exist. With any company this situation is constantly arising: "We need a few dollars worth of this or that, where can we get it?" Nobody knows, but after some effort a firm is found that can supply the needed article, and the purchase is made. In many cases a slightly different article, at perhaps half the cost, would have met the need just as well; or it might have been bought of some nearby firm, instead of a distant one, at a corresponding saving in transportation cost. The lost motion arises from the fact that each purchasing agent breaks a fresh trail for himself in the making of minor purchases. If the buyer and seller can be brought together in such a way that the necessity for this useless work does not exist, both will be the gainers thereby.

Sellers of goods are also subject to lost motion. They endeavor to get in touch with possible purchasers through the medium of salesmen, direct correspondence, and advertising. Where there is a reasonable possibility of securing a large order a salesman can be employed, on a small order his traveling and other expenses consume all the profit on the sale, and it is only in so far as his visit leads to later unsolicited orders that it is profitable. Correspondence is also expensive, unless well directed; in the average office a personal letter costs about 10c. to send, if all cost factors are included. Advertising is a means of reaching a wide public at a low cost per individual, but with it also the effect must be permanent to be profitable. A cigar-maker does not advertise his brand of cigars in the hope that everyone who sees his advertisement will at once buy a box. He advertises continuously and judiciously with the expectation of impressing his name on the memory of the public as a maker of goods of the quality he represents them to be, in the hope that from time to time those who have received this impression will purchase his product, that will thereafter sell itself to that buyer. The lost motion arises because the seller does not know exactly where all his buyers are to be found, and therefore he usually concentrates his efforts on one or more fields that he arbitrarily assumes will yield the best returns, and totally neglects the fields which will yield some, though less returns. In certain lines of products the mining industry has highly specialized needs, such as are now being covered by the advertisements appearing elsewhere in this journal. But, as shown by the cost sheets given by Mr. Silbert, rock-drills, dynamite, mine-cars, and metallurgical equipment do not circumscribe the whole field of a mining company's activity. If this list were to be extended to cover the whole mining community an even greater diversity would be found. As to many of these products the needs of the mining community are to some degree special, and the seller does not know how they differ from the ordinary, nor does the buyer know to what degree the seller can meet his needs. Mining companies build many houses, usually in regions where careful attention to heating requirements is necessary, but no maker of heating equipment seems to be aware of the fact, and the superintendent who is charged with building houses for his men is at a loss to know what kind to choose or whether it will prove satisfactory. The mining company needs typewriters, filing cases, card indexes, and so on; where shall it buy the most satisfactory article at the best price? The mining community needs automobiles, insurance, life, fire, and accident, phonographs, player pianos, books, gasoline, kerosene or gas stoves, household electric equipment, and other things too numerous to mention. Where shall it buy them to the best advantage and get what will give the best service. Here is where the lost motion now exists. The following article is the first attempt to make the needs of the purchaser clear. If the seller can obtain a clearer and more accurate idea of what the purchaser wants, and the purchaser of what manufacturers have to sell, both will profit by it. It will be our endeavor to devise a means by which this may be brought about.—EDITOR.]

The accompanying forms and data are offered as a contribution to the rather negligible portion of the literature hitherto devoted to a somewhat important branch of the industry—that relating to the purchases of sup-

plies. It has long seemed to me that but little of concrete interest to the many concerned with this phase of mining, has found its way into the pages of the mining journals. That which has been written has been of an extremely cursory nature.

Naturally, from the inception of operations, every operator must purchase supplies. Generally, until a producing stage has been reached, attempts by small operators at maintaining a well organized and dependable system of records for the guidance of those who make the purchases, are somewhat abortive. The invoices, as they accumulate, are plastered in invoice books or stuck away in files. Not until card systems are installed is there a well ordered method of quickly arriving at comparative costs.

Except in going concerns—where the services of a purchasing agent are available—the person who buys has rather vague ideas of what the first cost of supplies should be upon which he has not received quotations beforehand, and the like of which he has not theretofore purchased, since the vacillating tendencies of supply house-discounts, governed by the size of the order and the standing of the purchaser, preclude the possibilities of any accurate knowledge of costs being obtained from the catalogues. It is for the particular interest of these small operators that these forms are offered. Those in Mexico will find of especial service the columns devoted to Mexican duties. Those in the Southwest may see in the first costs at the large supply centres of Denver and El Paso information of some value to them. To engineers in these localities, planning construction work, and to operators figuring on additional installations, some helpful figures may be seen in these data.

The costs herewith shown are compiled from the purchase cards of the Tigre Mining Co., an operator, the extent of whose purchases may be learned from the list below:

Cyanide (100%)	700,000	lb.
Flint pebbles	1,000,000	lb.
Zinc dust	120,000	lb.
Muriatic acid	160,000	lb.
Litharge	20,000	lb.
Borax glass	20,000	lb.
Bone ash	6,000	lb.
Bi-carbonate of soda	6,000	lb.
Fluorspar	4,000	lb.
Silica	16,000	lb.
Soda ash	16,000	lb.
Crucibles	500	
Gas oil	25,000	gal.
Mixed oil and greases	2	carloads
Carbide	100,000	lb.
Carbide lamps	1,500	
12-lb. T-rail	150,000	lb.
Black pipe	60,000	lb.
Iron and steel	2	carloads
Cement	200,000	lb.
Blacksmith coal	200,000	lb.
Blasting powder	150,000	lb.
Fuse	1,000,000	ft.
Caps	300,000	

To L. R. Budrow, general manager for the Tigre Mining Co., I gratefully acknowledge my obligations for permission to publish this material.

The first costs on most of the articles enumerated are generally as low as careful buying and keen competitive bids can make them. In the delivered costs, no handling charges are included; the figures stand for the original cost, freight to mines, expenses of crossing at border, and the duties. For the guidance of operators in Mexico, who seek a basis of comparison in these figures, it might be well to mention that beyond the border (Douglas, Arizona) aside from duties and commissions, the following costs are accrued:

	Per 100 lb.
*Railroad freight to Esqueda	₱0.50
Wagon freight to mines	1.20
Total	₱1.70

*Carload rate is about ₱0.25 (Mex.) per 100 pounds.

Those operating farther in the interior, whose freight cost from the border is, say ₱5 (Mex.) per 100 lb., need but to add ₱3.30 per 100 lb. in order to arrive at the comparative figure.

There is no attempt in mind in these pages to direct attention to particular supply houses or manufacturers, as indicating those from whom the best prices may be obtained. Several other firms in the locality may have supplied the article at an equally low cost at various times. Nor is it the intention that any information given herewith be construed as pointing out the most desirable supplies from the consumers' standpoint. For instance, many brands of rubber belting are listed. Some have been found more satisfactory than others by the Company. Some brands have been entirely dropped, while others are favored. It must not be assumed that the prices shown are those available at the present time, for the reason that a period of three years is embraced in this compilation. Furthermore, fluctuations and constantly changing market conditions during that time have probably altered the present complexion of some of the figures beyond recognition. Also, an error may be found here and there. In the main, however, the data are dependable, and it is hoped the publication of same may serve the purpose of encouraging those whom it interests in making further contributions to the literature on the subject.

All figures herewith shown are in Mexican currency at an equivalent of ₱2 Mexican money for $1 in U. S. currency. The present rate of exchange is much higher. In the table 'Frac.' refers to the schedule of the Mexican tariff under which the article is quoted. 'K.b.' is an abbreviation for *kilo bruto* or gross kilo; 'k.l.' stands for *kilo legal*, or net kilo.

(Continued on page 542)

GOLD PRODUCTION of the Homestake Mining Co., to December 31, 1914, totaled $134,181,596, of which $33,405,700 was distributed in dividends. These totals include production and dividends of the mining companies which have from time to time been absorbed by the Company.

Mining Nitrates in Chile

By JOHN G. BECK

On the west coast of South America, bounded by the still unexplored Andes on the east, is one of the richest lands of the world. It is also one of the most desolate and barren of regions. It is devoid of all vegetation. Not a plant, a tree, a blade of grass, or anything green is to be found. It is a land where the rain never falls, and is absolutely waterless except for that brought down by pipe-line from the adjacent mountains. It is a land of salty particles that reflect the sun's rays, inflaming the eyes and parching the skin.

Such a land is the great nitrate field of Chile that runs through the desert up the west coast from Taltal at the south to Pisagua at the north. This district, all of which is in the *provincias* of Atacama, Antofagasta, and Tarapaca, extends practically parallel with the Pacific shore-line. Bounded by the Pacific Coast range of hills on the west, which extend inland approximately forty-five miles, and by the foothills of the Andes on the east, which are from 25 to 30 miles farther inland, it consists of a plateau from 2600 to 7500 ft. above sea-level and 600 miles long. To the east, towering above the foothills, can be seen some of the majestic peaks of the Andes, one of which, Llullaillaco, is said to be 22,000 ft. high.

POWDER MILL.

THE RESULT OF A BIG BLAST.

While the mineral deposits in the mountains bordering the district have been a source of wealth for hundreds of years, being rich in gold, silver, copper, and tin, the greatest are the nitrate deposits, that for a generation and more have made Chile richer than any other South American country, and today are paying from 75 to 80% of all the government expenses and in addition are yielding fortunes to those who exploit them. Since 1889 many thousands of workmen have been employed on the *pampa* (nitrate fields) in the extraction of *caliche* or nitrate-bearing rock, from which the nitrate is obtained by the leaching process. During this time the total revenue from nitrate export duties has been over $400,000,000 in gold.

The nitrate beds are found in the desert, known as the *pampa*. The *caliche* is not regularly and evenly distributed, as much of it is found in pockets. Often a *pampa* comprises an area of several square miles, but there are others where the beds of good *caliche* are confined to a few hundred acres and less, and the nitrate content varies greatly. As a general thing the *caliche* is close to the surface. It crops out here and there and seldom extends more than twenty feet below the surface. There are places, however, where the beds carry an overburden of several feet of waste material, consisting of sand and *pauqueque*, which is a hard, dry clay. Such a condition exists on the *pampa* of the du Pont Nitrate Co., at *Oficina* Delaware, which is about 90 miles inland from Taltal, Chile. For a long time past it has been apparent that the present methods were far too costly at the present rates of labor. Though at different times experiments have been made by different producers to extend mechanical treatment to those processses which have always been carried out by hand, the results have not been satisfactory. Little was done to improve upon the primitive hand methods employed when nitrate was first worked until the new Delaware came under the ownership and management of the du Pont Nitrate Co., that with the usual Yankee initiative and vigor is installing costly machinery for an entirely new process.

The *caliche* lies in irregular beds or strata at some distance under the surface; and the method of getting it out is to bore a round hole, about one foot in diameter, from the surface through the sand, *pauqueque*, *costra*, and *caliche* to the *choro* or waste material which underlies the *caliche*. A large pocket is worked out in the *choro* under the *caliche*, and this enables the driller to pack practically all of the powder, used in blasting, at the bottom of the hole. Very often it takes several days to complete one of these holes, as the material is very hard and has to be drilled and blasted. The powder used is made at the *oficina* out of nitrate, charcoal, and sulphur. It is a slow-burning powder, but it has been proved that this low-grade

DRAG-LINE SCRAPERS OPERATING ON A 6 PER CENT GRADE.

powder is much more effective than the faster powders. The explosion breaks up the earth for a radius of 40 ft. around the charge, mixing the *caliche* with the waste material. All of this has to be separated, the waste material thrown to one side and the *caliche* broken up into lumps of such size that they can be loaded by hand into the cars or carts that transport it to the *maquina*, or factory, where the nitrate of soda is extracted as later described. It can easily be seen that this primitive method of getting out the ore is not only slow but costly, as the increased production of the past few years has created a greater demand for labor, with a corresponding increase in wages.

The du Pont company has installed a Bucyrus class 14 drag-line excavator, mounted on a caterpillar tractor, which is being used with great success for stripping the overburden, and it is expected that the machine will later be used for loading the *caliche* into cars. This machine is equipped with the standard 60-ft. boom and carries a 2-yd. scraper bucket, fitted with forged teeth, the points of which are made of tool steel, hardened. In view of the high wages paid, the average being 10 pesos (about $2 gold) per day, and the fact that practically all of the workmen are imported from outside the district, a machine such as the drag-line excavator, which is capable of handling without blasting, 1000 yd. and more per day and of doing the work of a hundred men, will revolutionize *pampa* operations and materially reduce the cost of production. Not only will it reduce the cost of operations, but it will make it possible to work isolated and abandoned places, where the cost of removing the overburden was prohibitive. Very often thin veins of almost pure nitrate of soda, from 50 to 75% pure, are found, but cannot be worked on account of the high cost of removing the overburden.

The material encountered is probably the hardest ever dug with a scraper bucket without blasting. The *pauqueque* is especially hard, consisting of dry clay and conglomerate, cemented into a solid mass with salts; in fact, this *pauqueque* is so hard that it is often mistaken by the inexperienced for *caliche*. The machine makes a cut about 100 ft. wide, removing the overburden to one side in a pile. All of the waste material is removed and the *caliche* left in a clean state ready for the drillers. After the ore has been taken out, the machine is moved back to the place where the cut was started and a new cut

OFICINA DELAWARE, OWNED AND OPERATED BY THE DU PONT NITRATE COMPANY.

taken out. The waste material in this second cut is deposited in the trench, from which the *caliche* has been previously removed. This operation necessitates the rehandling of the first spoil pile, but any number of cuts can be taken thereafter and the waste material deposited in the worked-out area, without rehandling.

As previously stated, the *caliche* beds are scattered over a large area. It is necessary to do a great deal of moving from one part of the *pampa* to another. For this reason the machine was equipped with a caterpillar traction, which enables the machine to be moved over very rolling ground at the rate of about ½ mile per hour, often climbing grades as steep as 10%. The excavator was not put to any very severe tests while I was at the *oficina*, but up to the time I left, it had done enough work to prove that it would meet every expectation of the purchasers, in fact it handled material without blasting that the purchasers had fully expected it would be necessary to blast before the machine could dig it.

The *caliche* as delivered at the *maquina* is in rough lumps and is crushed in an 18 by 20-in. crusher. It is dumped from cars—usually of the Koppel side-dumping design—into a bin that roughly holds 125 carloads of *caliche*. From the bin it passes through doors at one side to the Blake crushers which deliver the crushed *caliche* upon a short belt which discharges into a bucket elevator. The crushers are set to break the ore into pieces about the size of a man's fist, but because of the earthy nature of the material there is a considerable quantity of dust and smaller pieces. The elevator discharges above in the *maquina* into a chute, which in turn discharges into cars of a capacity of approximately one cubic metre or two tons, these cars being on tracks running over the boiling-tanks.

The solution of the nitrate and its extraction from the ore takes place in the boiling-tanks, the system being simply a counter-current solution treatment. In the various *oficinas* the number of boiling-tanks of course differs to a great extent and the minor details of operation may vary, but in the main it may be said that practically every *oficina* uses the same general methods in the treatment of its *caliche*. The *cachuchos* or boiling-tanks are usually about 40 by 7 by 8 ft., fitted with steam coils connecting to a main header running the length of the *maquina*. Each tank is connected with the tanks on each side of it by a valve which allows for the passage of liquor from one tank into the next. On each tank there are also two valves opening into a pipe below the tank, leading to the pumps, by which the liquor in any tank may be pumped into any other tank; also valves by which the *relaves* or wash waters may be drawn off to a storage tank below, and the valve from which the *caldo* or hot saturated solution of nitrate is run. In the bottom of each *cachucho*, 9 in. from the floor, are crinoline plates, perforated with ½-in. holes, beneath which the *borra*, or fine mud, collects. Along one side of the boiling-tanks run canals, through which the liquor, discharging from the pumps when pumping from one *cachucho* into any *cachucho* in the series ahead of it, flows, and through which the wash waters and *aqua vieja*, or mother liquor, are delivered to the proper tanks, these canals opening through plugs into each *cachucho*. Below this boiling-tank floor is the *ripio* floor where the *ripio*, or tailing, is discharged through two or three doors in the bottom of each boiling-tank into the dump cars which are drawn by mules to the dump.

The remainder of the apparatus consists simply of centrifugal solution pumps, a pump for water and *aqua vieja*, *relave* pumps, and various tanks for the storage of *relave* and *aqua vieja* and water. In many *oficinas* the *aqua vieja* and *relave* are preheated by the exhaust steam from the boilers supplying the power. There are also settling-tanks, in which the muddy *caldo* is allowed to clarify, and the crystallizing pans. Of settling-tanks there need be only four, of about 500 cu. ft. capacity each, for an ordinary sized *oficina*, and of crystallizing pans anywhere from 90 to 200, depending on the time which it is desired that the hot crystallizing liquor should stand. These crystallizing pans are usually of a capacity of 450 to 600 cu. ft., and of a size about 17 by 17 ft., having a sloping bottom, being 2 ft. deep at one end and 2½ ft. at the other. By the side of each line of bateas is a *falca* or draining platform, on which the wet nitrate when shoveled from the batea is allowed to drain before it is unloaded into the cars which carry it to the *caucha*, the final drying and sacking floor. The settling-tanks are connected to the *cachuchos*, and the crystallizing pans to the settling-tanks, by canals through which the hot liquor to be crystallized finally finds its way to the batea.

For the sake of conciseness, assume an *oficina* having 18 boiling-tanks in two sections of nine each, and operating on a basis of ten *fondadas* per day, that is to say, filling, treating, and discharging ten tank loads of *caliche* per day. This is a production of roughly 50,000 quintals per month (a quintal is 100 lb.). The object of the operation is, of course, to extract from the ore all the nitrate possible in the time allowed. For different classes of *caliche* different periods of steaming, steam pressure, and washing are found necessary, but the main operations remain practically the same. The *oficina* assumed will therefore make five *fondadas* per day from each section of nine boiling-tanks. Looking at the system at the time, say, when the hot saturated solution is being drawn off of the first tank in the series, we find this: Five tanks will be under steam, the liquid in them boiling or steaming. From the first tank under steam the *caldo* will be flowing through the *caldo* valve to the settling-tanks. The liquor in the tanks back of this *caldo* tank will be passing through the valve into the *caldo* tank, and correspondingly the liquor in each tank back as far as the sixth will be passing into the tank ahead, so that there is a difference of level from the height of the liquid in the sixth tank to the first tank. The sixth tank is filled with *relave*, not under steam, and this tank in turn is kept full, in order to maintain a head and force the liquors in the tanks ahead of it

THE MAQUINA DELAWARE.

through to the *caldo* tank, by pumping *relave* from the *relave* storage tanks. The seventh and eighth tanks will be soaking under fresh water, which, when it has stood for a sufficient length of time, is drawn off to the *relave* storage tanks, since it has taken up nitrate and salts. It is this liquid which is pumped to maintain the sixth tank full. The ninth tank will be empty, charging with *caliche*, or discharging *ripio*.

All densities of liquors are taken by a Twaddell hydrometer. The *caldo* is usually started to run when it has a density over 100°T., and is cut at about 95°. Between these two densities it will run perhaps for two hours. From each tank to the tank behind there is a drop in density of about 10°, since the tank farther back has had more extracting and therefore has less nitrate to pass into solution than the tank ahead of it. Imagine, then, that the *caldo* has dropped to 95°T. and has been cut. By this time tank number nine is charged with *caliche*. The liquid from the last *caldo* tank passes upon the fresh *caliche* in number nine; from which in turn, when the liquid has reached the proper density, the next *caldo* will be run. No. 2 passes into No. 1, No. 3 into No. 2, and so on. The steam on No. 5 is turned off and the steam on the fresh tank-load of *caliche* turned on. No. 5 is then filled with *relave* and now holds the same relation to the rest of the system as No. 6 did when *caldo* was running from No. 1. No. 6 and No. 7, of course, now become fresh-water tanks, and No. 8 is discharged or filled. It is at this time when the pass is being made upon a tank-load of fresh *caliche* that the *aqua vieja* or mother-liquor from the crystallizing pans, liquid rich in nitrate but which will no longer crystallize in the batea, is worked into the system. It will have a density of from 75 to 90°T. and is run into the tank under steam having the nearest density to its own.

It will be seen then that the strongest liquor passes into the least extracted *caliche* and the weakest liquor into the most extracted *caliche*, each tank-load of liquor, as it takes up more nitrate and increases in density, passing on to the tank ahead. The *caldo* drawn off from the boiling-tanks flows through a canal to settling-tanks,

ANOTHER VIEW OF THE REDUCTION PLANT.

where it is allowed to stand for about two hours. The mud and considerable of the salt and impurities here separate, and the settled *caldo* is then run directly to the batea, where, upon cooling, the nitrate is deposited. Of nitrate about 25 lb. per cubic foot of *caldo* is deposited. After cooling to air temperature, which requires from 5 to 10 days, depending upon the season of the year, the mother-liquor is drawn off through a canal to a storage tank, and the nitrate deposited in the batea is ready to be thrown on the *falca* to drain off as much of the *agua vieja* as possible. It is then carried in cars to the drying floor, where after standing for about a month it is sacked and shipped.

To supplement the above the following analysis may be of interest:

Caliche.	Per cent.
Sodium nitrate	15.00 to 30.00
Sodium chloride	2.00 to 15.00
Sodium sulphate	5.00 to 20.00
Magnesium sulphate	0.50 to 5.00
Magnesium chloride	0.00 to 5.00
Calcium sulphate	0.50 to 5.00
Sodium	0.04 to 20.00
Ripio.	
Sodium nitrate	3.00 to 7.00

Origin of Oolites and Oolitic Texture in Rocks

In a paper presented before the Geological Survey of America and recently published in volume 25 of the *Bulletin* of the Society, Thomas C. Brown gives the results of detailed studies upon oolites. The matter has considerable bearing upon the genesis of such widely different materials as the Clinton iron ore of the East and the phosphate beds of Idaho and Utah in the West. The paper is too long for reproduction, but Mr. Brown's general summary is presented below:

"From the observations here recorded it seems evident that the recent oolites now forming in Great Salt Lake and Pyramid lake are like those now forming in hot springs and in the open ocean, composed of calcium carbonate in the mineral form aragonite, and they frequently contain sand grains or nuclei of other foreign material. They probably are due to direct chemical precipitation caused by a reaction of sodium carbonate on the calcium sulphate held in solution by the water. The sodium carbonate in Great Salt Lake may be due to the decay of the dead minute algæ found so closely associated with these oolites below the limit of wave action. The argument in favor of these oolites having been derived from solutions of calcium sulphate is greatly strengthened by the fact that the great deposits of the oolitic sand along the shore of the lake are confined to a stretch near the mouth of the Jordan river, and this river until two or three decades ago carried calcium sulphate in solution in excess of any other salt. This salt is now exceeded in amount by sodium chloride, due to the effects of irrigation along the course of the river, but it is still the most prominent calcium salt.

"The older oolitic beds of Pennsylvania were probably all originally laid down as beds of calcareous oolites composed of the mineral aragonite. This mineral, being unstable under ordinary rock forming conditions, soon began to change. Where the beds were not affected by waters bearing other minerals in solution they simply changed to the more stable mineral calcite, and in doing so they often retained their original fibrous radiated and concentric structure. Sometimes, however, they became more or less completely changed into crystalline calcite, occasionally with twinned lamellæ.

"When the circulating waters contained magnesium salts in solution the oolites became altered to dolomite, and in doing so lost their concentric and fibrous structure. The oolitic structure is then only shown by the faint outlines of the original oolites, sometimes accentuated by a ring of rhombohedral crystals around their margin, developed when the process of alteration first commenced.

"When the circulating waters contained silica in solution the oolites were frequently replaced by silica. If the oolite had an original nucleus consisting of a quartz sand grain, this was frequently secondarily enlarged by the deposition of silica around it and in optical continuity with it. In other oolites the replacement was accomplished either by the deposition of granular quartz or of finely fibrous chalcedony. In any case minute rhombs of calcite are frequently inclosed in the replacing silica, showing clearly that the aragonite had in part changed to calcite before replacement by silica began. With the silica is often deposited minute quantities of iron oxide intimately mixed with the fibrous chalcedony.

"At the Clinton horizon in the Silurian, in Pennsylvania, and in other states along the Appalachian Mountain belt, one or more beds of iron ore occur which are either fossiliferous or oolitic. Oolites are present to some extent in all of these ores. They were evidently formed originally as aragonite oolites and later changed, together with the associated fossils, by ferruginous solutions, into oolites composed of iron oxide and silica intimately mixed, but with the iron oxide greatly in excess.

"It is very probable that the silica replacing the oolites of the Ordovician, and the iron and silica replacing the oolites of the Clinton, came from material already in the beds and at no great distance from where it now occurs. The silica probably came from sponge spicules and diatoms, and the iron (with its associated silica, perhaps) from green sand or glauconite."

RE-TREATMENT of residue at the Lake View Consols mine, Kalgoorlie, Western Australia, was started in May 1908. A vacuum-filter plant was used, and 826,084 tons was treated yielding 94c. per ton, at a cost of 62c. per ton. The December output of 56c. per ton resulted in a loss of 4c. per ton. This old material was a mixture from oxide and sulphide ore treated by a variety of processes in the experimental stage of the district before the best metallurgical methods had been determined.

Some Problems in Copper Leaching

By L. D. RICKETTS

*In recent years the metallurgical field of the copper industry has expanded greatly, the copper ores have become lean and diverse in character, and we are obliged to treat such ores on a very large scale. On the commercial side, the operating and consulting staffs of the great mining companies have been enlarged and organized, and no great capital expenditure is decided upon until it has been investigated and recommended by a highly organized force of specialists as a committee.

I believe that in the scientific field and in the most valuable proceedings of our various societies the old idea of one-man point of view and one-man treatment of principle and detail together has been splendidly developed and should continue, but for the advancement of our art we should deliberately discuss subjects among ourselves in order to do away with the idiosyncrasies of the individual and to gain a composite view representing the best thought of many men.

In the development of new ideas leading to the introduction of new methods, the societies could enlarge their present great field of usefulness if such discussion be had, and in my opinion further great good could be done if a number of men of different qualifications and experience would join in preparing a joint book, each dealing with his particular problem, but consulting the other men. In this way individualism would be preserved and various processes would be described, and if properly reviewed the paper would be palpably capable of analysis, and the student would have at his command the associated efforts of a group of qualified engineers.

I have neither the time nor the qualifications to make an investigation and study in detail of hydro-metallurgical processes, but for some years I have foreseen the development of such processes, and I have a deep interest in the subject and have given it in some of its phases careful consideration from a long-distance viewpoint. I have assisted in directing many experiments and in reviewing the merits of many processes, and am glad to make some introductory remarks with the understanding that other gentlemen present will freely and candidly enter into the discussion and help to fill out the few bare bones that I can uncover. You will see in my remarks that I am controlled very largely by operating demands. No matter how beautiful the process, simplicity and cheapness of operating costs are the main features that appeal to me, and complexity and increased costs only appeal to me if they definitely promise an increased yield that will more than offset the increased expense; for, given the grade, the maximum profit per ton is demanded.

As you all know, there has been a very large development of deposits of lean copper ores in the Southwest in recent years, and this region has rapidly developed until in the aggregate it produces more copper than any like area in the world, and it still has a large increase of output ahead of it. The vast mass of these lean deposits consists of sulphide ore, and until recently these sulphides alone have attracted serious attention. It is well known, however, that there are large deposits of oxidized copper ore associated with the lean porphyries.

A few years ago the Calumet & Arizona Mining Co., upon the recommendation of J. C. Greenway, took an option upon a majority of the stock of the New Cornelia Copper Co., whose mining properties are at Ajo, in southwestern Arizona. Mr. Greenway directed systematic drilling upon this property, followed by the sinking of some 70 shallow shafts for test purposes and the sinking of two deeper shafts, with considerable underground development, for the purpose of testing and checking the grade of the sulphide ore. The stock was purchased.

The matrix of the ore is eruptive granite. There is no overburden. The chalcocite has been oxidized nearly as fast as formed. The zone of transition from oxidized minerals to primary sulphides is narrow. The oxide and sulphide ore is remarkably uniform in grade. Ira B. Joralemon's paper, in the *Transactions*,[1] described this deposit. He shows that there is about 40,000,000 tons of ore containing 1½% copper, and the tonnage is divided into about 12,000,000 tons of 1½% oxidized ore and 24,000,000 tons of sulphide ore, with about 4,000,000 tons of mixed oxide and sulphide between. If the grade be dropped to an average of less than 1½%, these tonnages would rapidly increase.

In parallel with this development, oxidized ore in notable tonnage has been found in the Globe mining district. This ore is more scattered, and, on the whole, is leaner than the Ajo ore, and frequently has a large capping of overburden. In the aggregate, the Inspiration Consolidated Copper Co. alone now has over 15,000,000 tons of oxidized ore running about 1.3%, and a probable tonnage in addition. There are other mines in other districts containing oxidized ore, notably in Utah and Montana, and there are also oxidized ores at other points in Arizona and a vast deposit in Chile. The treatment of such tonnages is of prime importance.

The Ajo ore has a matrix of granite with a large percentage of secondary quartz replacing feldspar. There is little calcium present in soluble form, and the oxidized ore seems to be best adapted to a leaching process. Preliminary laboratory tests showed that the ore crushed with the production of remarkably little slime and that the copper will dissolve in dilute sulphuric acid quite freely when the crushed ore contains fragments no larger than 6-mm. cubes. Tests also showed that a little cuprite is present, which is only partly soluble in sul-

*Excerpt from a discussion at a meeting of the New York Section, A. I. M. E., January 6, 1915.

[1] *Bulletin* A. I. M. E., August 1914, pp. 2011 to 2028.

phuric acid. There are also other soluble salts, notably salts of iron and aluminum. It was decided to investigate a leaching process for the oxidized ore, and since the ore made but little fine and could be leached with comparatively coarse crushing, we decided that we would try to leach in tanks by percolation. The amount of silver in the ore is small. Salt is apparently expensive, and it was decided that, other things being equal, the use of chlorine compounds as solvents was not desirable. I know, of course, that chlorine compounds may have a great future in leaching, but in this particular case, and in the early development of a process, it was considered that sulphuric acid offers fewer difficulties as a solvent.

To me the hydro-metallurgical problem divides itself naturally into two nearly separate divisions—the solution of the copper, and the recovery of the copper from solution. We were obliged, however, to study the problems of solution on the basis of getting the copper into solution in the form most convenient for its ultimate recovery.

At the start we employed Stuart Croasdale to undertake a study of the solution of the copper, and we also delegated to him experimentation upon the precipitation of copper by iron. Mr. Croasdale ably conducted a long series of most valuable experiments and published a paper upon this subject which you will find in the *Transactions* of the Institute.[2] At the same time we were fortunate enough to obtain the advice of Utley Wedge upon the manufacture of sulphuric acid direct from calcining-furnace gases.

Mr. Croasdale demonstrated that the ore crushed to an 8-mm. cube, or smaller, would yield over 80% of its copper when treated with a dilute solution of sulphuric acid. He demonstrated that slime presented no difficulty if the ore was distributed in the tanks uniformly, and that by finer crushing 85% of the copper could be obtained in solution if treated for a sufficient length of time with an acid solution. He demonstrated not only that the ore was permeable uniformly, but that with comparatively small tanks the height was not a matter of great consequence, and he was easily able to use a column 12 ft. in height, and could probably use one much higher. Later on we found upward percolation preferable.

Mr. Wedge showed us that with care in calcining the sulphide fines for reverberatory furnaces at the Calumet & Arizona smelter at Douglas, sulphuric acid of 55 to 60° B. could be manufactured with a low operating cost, and a construction cost of not to exceed $3000 per ton of daily capacity. The point of manufacture is about 300 miles, more or less, according to the route, from the mine. Mr. Wedge also undertook a study of sulphating and chloridizing roasts. His requirements were that the ore be crushed to pass a 1½-mm. screen. He showed that if the sulphide ore could be mined in parallel with the oxidized ore, and in proportion to their respective tonnages, there would be sufficient sulphur for his purposes and that a very high extraction could be obtained. He also showed that sufficient advantage could not be had in using salt to offset its cost and the difficulties that might arise later. Mr. Wedge also showed that a small amount of heavy sulphides from the Bisbee mines crushed and mixed with the oxide ore would give a very high percentage of extraction after the mixture had been subjected to a sulphating roast. He also introduced the idea that a preliminary water leach would give a perfectly pure sulphate solution from which the copper could be recovered electrolytically and that the acid thus regenerated would be sufficient to complete the leach.

Frederick Laist in the meantime was conducting a number of experiments governing processes in a like brilliant way, and among these processes was the development of an oxidizing roast on Anaconda tailings. Like Mr. Wedge, Mr. Laist found that by calcining sulphides or mixed sulphides and oxidized ores a high percentage of the copper could be extracted by leaching. Temperature control was vastly important, as the developments of both Messrs. Wedge and Laist showed. If too high a temperature is used a large amount of the copper becomes insoluble in the strongest acid, but in both cases temperature control was demonstrated to be simple and practicable, and under these circumstances practically no insoluble copper compounds were formed. In Mr. Laist's case, however, the use of salt is essential on account of the silver content of the charge, but he finds that it is not necessary to use this in a chloridizing roast and that a solution of salt with sulphuric acid gives him the desired extraction on the product from the oxidizing roast.

The manufacture of sulphuric acid by the chamber process, while simple, requires a very large investment, and in this case the transportation charges would amount to more than the cost of the acid. The chamber and the contact processes, of course, are the two important manufacturing processes, but even a casual study of wet methods of copper recovery shows that there are other methods of acid manufacture involving a principle similar to the chamber method, that might be used in parallel with the recovery of the copper from solution with less investment for plant and with a saving in energy that is important.

The McKay process includes a sulphating or an oxidizing roast, as is desired, to get sulphide of copper into soluble form, and he adopts the same process for this purpose as followed by Messrs. Wedge and Laist.

The Slater process and the Midland process deserve study. They depend upon the use of a complex series of chlorides and hypochlorous compounds that will dissolve many salts of copper that sulphuric acid will not touch. They will attack, among other things, chalcocite, and they deserve serious consideration in many important but special cases, as they avoid the necessity of a preliminary roasting operation. I regret that I am only slightly familiar with the very important work in the development of a process by E. A. Cappelen Smith for the beneficiating of the Chuquicamata ores.

[2] *Bulletin* No. 92, August 1914, pp. 1881 to 1929.

Recovery of Copper From Solution

At the beginning of our investigation we seriously considered what I called the 'brutal method' of leaching, namely, the manufacture of sulphuric acid, the solution of the copper from the ore with such acid, and the precipitation of the copper by metallic iron, with the resultant complete, or nearly complete, destruction of both acid and iron and the production of an impure cement copper that will have to go through the process of smelting and refining. The results of Mr. Croasdale's tests and Mr. Wedge's cost figures indicate that such a course was commercial, and we concluded that the 1.5% Ajo ore, with no overburden, mined by steam shovel and crushed coarse, would yield a profit on a 12c. copper market if a cheap grade of Alabama pig iron were used.

But it occurred to me, as it had occurred to many engineers, that oxide of iron could be reduced to metallic iron without fusion, and if so we might bring Bisbee sulphides to the mine, calcine them for the manufacture of sulphuric acid and then metallize the available iron in the impure calcine, already containing metals requiring recovery, and use this for a precipitant. I found at the start that metallic iron was being produced by this method with an inferior fuel from high-grade iron ore by an intermittent process; that is, by first heating to the desired temperature by internal combustion of a part of the excess coal in the charge and then allowing the heated charge to stand without the admission of air, but allowing the gases formed to escape freely.

After consulting with friends, we concluded to try the experiment of a multi-hearth furnace, and at first my idea was that possibly calcining could be done on the upper hearths and the hot calcine could then pass to the lower hearths, where it could be further heated and submitted to a reducing action. We erected a small Wedge furnace, but only tried to metallize, and not to calcine in it. Some of the iron oxide was reduced to metallic iron, but on the whole our experiment was a failure because in keeping the charge hot the percentage of carbonic acid gas produced was sufficient to retard and reverse the action of carbon monoxide in reduction. In parallel with this, we also made experiments in revolving cylinders, aiming to reduce the iron to the metallic form with illuminating gas and with fuel oil by a continuous process. These also were failures.

Mr. Laist conducted similar experiments on a continuous process for making sponge iron at Anaconda, and ended with a like failure. He has, however, demonstrated that he can make sponge iron by an intermittent process in a revolving drum. It had become evident to me, even in my limited environment, that the simple use of iron, with the destruction of both iron and acid, to the production of an unfinished product, while apparently commercial, was in our extremely simple case preposterous, and investigation showed the splendid work done on other lines and convinced me that if considered from a commercial viewpoint better methods were bound to develop a process that would fit our requirements, and very much cheaper copper would result.

At the start we decided to investigate the electrolytic deposition of copper from solution, but a little later on we took up the subject of the direct precipitation of the copper by sulphurous acid gas. I prefer to discuss the latter subject first for the purposes of this paper.

In the precipitation of copper by sulphurous acid gas, temperature and consequent pressure must be considered. If the copper is precipitated in metallic form this temperature and pressure are very high, but if a subchloride of copper would satisfy us, the temperature and pressure may be moderate. In both of these processes the reactions we are familiar with in the formation of sulphurous acid by treating copper turnings with concentrated sulphuric acid are reversed by heat. For the production of metallic copper the action depends upon getting sulphurous acid dissolved in the sulphate solution in sufficient amount to precipitate the copper and then heating the mixture under proper control to about 150°C. The question of the use of an abnormally rich gas is involved. Under proper regulation pure copper is produced, which only needs melting for the market, and a large excess of sulphuric acid is formed. Mr. Van Arsdale has done valuable original work on this process, followed by the work of Weidlein and others in its commercial development. Laist has studied precipitating subchloride of copper. A soluble chloride is added to the sulphate solution of copper and the proper amount of sulphurous acid is added. Moderate heat under pressure—90°C. of heat—precipitated almost all the copper as subchloride. The subsequent process of obtaining the copper without volatilization and the recovery of the chlorine offered difficulties. Messrs. Van Arsdale and Bacon have valuable experience on this subject.

This process needs further development and is most interesting. It is with no disparagement of the process that we have abandoned it in our case. I simply feel that the method would be a complicated and an expensive one, and I fear working with heat and pressure where fuel is dear and a corrosive solution is used. To me and my friends the electrolytic method seemed best adapted to our condition and the simplest and most certain of commercial application.

Of course, the first difficulty was the solution of other oxides than copper and the danger of some loss of acid thereby, and, what was more important, the susceptibility of some of these dissolved neutral salts to oxidation by nascent oxygen to the production of acid salts, which in turn will dissolve copper from the cathode. It seems that such salts are most valuable as depolarizers, but must be held under control.

After investigating the subject I advised Mr. Greenway on behalf of his company, and we employed F. L. Antisell to make and direct a series of tests and experiments covering the precipitation of copper in the presence of iron and aluminum sulphates. For some time previous I had been familiar with experiments tried by Messrs. Pope and Hahn, and these gentlemen were employed to investigate in parallel the practicability of removing enough of the iron and alumina from the solu-

tions as they foul, to keep them below the danger point in electrolytic work. Both Mr. Antisell and Messrs. Pope and Hahn began their experiments upon a laboratory scale at the Raritan Copper Works. Messrs. Pope and Hahn found the leaching could be so conducted that the rate of increase of iron and alumina was slow. They therefore decided to leach in a certain way and to treat a certain high iron and aluminum neutral solution with copper oxides by agitating, heating, and injecting air. This is a rejuvenation of the old Hoffman process applied to a new purpose. The iron and aluminum sulphates in such foul solution, together with arsenic and other impurities, are precipitated as insoluble oxides and the acid previously combined with these salts is taken over by the copper oxide and forms sulphate of copper. The clarified solution, with these impurities removed, is then mixed with the remainder of the solution, thus keeping an iron content of, say, less than ¾ per cent.

Mr. Antisell began his experiments by using a patent anode. This anode was a narrow, rectangular wooden or lead frame with thin wooden sheets as diaphragms, forming a long and deep but very narrow box. It was packed with clean coke in lumps crushed to pass a 1-in. ring, and contact was given by carbon rods imbedded in the coke. A solution of sulphate of iron and aluminum in great excess was made up and sulphuric acid added. This was used as a solvent for the copper. After the solution came from the ore it was at first passed to an absorption tower, where sulphurous acid gas was absorbed, and then it passed to the electrolytic tank. I go into no detail in describing Mr. Antisell's flow-sheet and his process, as he himself is present. After promising results had been secured in the laboratory tests at Raritan showing the possibility of high extraction and low power costs, Mr. Antisell sent Mr. Jamieson to Douglas, where tests were made with full-sized anodes. Excellent results were obtained here, but difficulty was had with the complete absorption of sulphurous acid. Also, the anode was cumbersome and not adapted to operating conditions, but, notwithstanding, excellent results were obtained experimentally and he ran for a long time with a recovery of nearly 2 lb. of copper per kilowatt-hour, an extraction of 80% of the copper content of the ore, and the production of nearly the theoretical amount of sulphuric acid from the SO_2 gas.

Messrs. Pope and Hahn later went to Douglas and began experiments, and also later conducted a most valuable set of experiments on the manufacture of acid-proof coatings for concrete that will neither crack nor soften under the high temperatures of the Arizona desert, and which will adhere closely to the sides of the tank. This work is very important and needs mention.

Mr. Greenway discovered that if a certain copper solution containing salts of triad elements is treated in a simple way, the iron or aluminum triad salts may be removed. Dyad salts are not affected. He was led to the belief that such oxides thus precipitated were in large part insoluble in dilute acid and that therefore he had a very simple method of removing iron and aluminum from solution. Against my prediction, laboratory tests seemed to show his contention was correct. Having used up about 300 or 400 tons of Ajo ore at Douglas for the Croasdale, Antisell, and Pope and Hahn experiments, and having promising results, the engineers moved to the mine of Ajo. Mr. Greenway erected a small plant of his own, and a Pope and Hahn plant was built and the use of sulphurous acid was temporarily discontinued. As for the Greenway process, I am not yet at liberty to discuss it further. But I may say over 100 charges were run with this process. The iron content in the solution was kept down to less than 1%, and we obtained an average of slightly over 1 lb. of copper per kilowatt-hour, but the extraction was low. We then extended the time of the leach and obtained a higher extraction, and finally we began to crush the ore finer, which at that time had been crushed only to ½-in. ring, and found that if crushed to pass ¼-in. mesh percolation was not retarded and an extraction of over 80% was practicable. The iron has reached as high as 1.2%, but we are still getting a pound of copper per kilowatt-hour from the electrolytic tanks.

These experiments have been so successful that we are proceeding with the erection of a 40-ton plant, where tanks will be used that will hold 60 tons, if necessary, and will be abundantly large to permit of a study of the comparatively even distribution of crushed ore, and we shall proceed with these most interesting experiments, using first, as we have in the smaller tanks, the Greenway process. In the meantime, the 1-ton plant will be liberated and we will immediately proceed with the continuance of a modified form of the Antisell system of leaching. He finds that with the construction of better absorption towers we can absorb the necessary amount of SO_2 gas, and he has demonstrated that with the use of SO_2 gas, using dyad iron as a depolarizer and triad iron as an oxidizer, he can manufacture sulphuric acid. We can, if successful, obtain 1½ lb., and possibly more, of copper per kilowatt-hour, and at the same time manufacture sufficient acid to replace wastage. The electrolytic copper in all cases has been fully up to the trade standards.

Conclusions

My deductions from a study of the work of the able engineers engaged in these extensive operations are as follows:

1. Dilute sulphuric acid will give a very high extraction on oxidized ores of the Ajo type. Time is a more important element in extraction than strength of acid. A maximum size of 6-mm. cube is required. Such ore crushed to the maximum size permits percolation and the production of a clear solution because the slime content in the ore so crushed is very small.

2. Where such ore is mined at a cost of between 25 and 50c. per ton, it is commercial on a 12c. market, even if leached with sulphuric acid and the copper precipitated with pig iron to the waste of the acid and iron and the production of an impure cement copper that requires further treatment. Metallized iron from calcine

can be made and will prove a little cheaper than pig iron if it is marginal.

3. An electrolytic method for the recovery of pure copper from sulphate solutions is far preferable and will produce cheap copper. In all cases a low current density is required. Hard-lead anodes or composite anodes of hard lead and coke of uniform thickness will be used.

4. Such electrolytic method, with control of the amount of iron and aluminum in the electrolyte, and without the use of sulphurous acid gas, is practicable. An acid loss of about 1.5 lb. per pound of copper will be sustained. Chamber acid will be required.

5. I believe there is a decided probability that the cheapest and best method will be the electrolytic deposition from sulphate solutions without iron control, and the use of the requisite quantity of sulphurous acid. The sulphurous acid will be absorbed without the tank house and in quantity that will not cause annoyance. Iron and aluminum will act both as depolarizers and catalytes. This process promises a high yield of cathode copper per unit of power and the manufacture of sufficient sulphuric acid to replace the waste.

6. While these remarks apply to the Ajo oxidized ore and ores physically and chemically similar, they need not apply to ores of a different composition. Mixed oxide and sulphide ores, be the sulphide chalcocite or chalcopyrite and bornite; ores containing great quantities of clay, or presenting other difficulties, have to be considered separately, and there is beyond question a great field for other processes and for other methods, both for obtaining the copper in solution and obtaining the copper from the solution. And now I end my theme as I began. Notwithstanding the importance of this subject, it covers but a corner in the metallurgy of one metal. There are many other subjects which if discussed in committee and with an open mind will lead to the advance of ourselves and of our institutions.

Some Uses of Traverse Tables

By JAMES UNDERHILL

Traverse tables may be used in many ways not ordinarily taken up in books on the subject. Besides being used to determine quickly the sides of right triangles, they may be used with a little trouble for oblique triangles, as a table for stadia reductions, and also in place of a slide rule for many calculations.

Traverse Tables for Right Triangles.—The chief use of the traverse table in surveying is to calculate the horizontal distance quickly in the field, where a transit and long steel tape are used. For this purpose a traverse table to 15 min. is accurate enough. Example:

Vertical angle.	Distance.		Horizontal distance.
16°	275.9 = 270	=	259.5
	5.9	=	5.6
	275.9		265.1

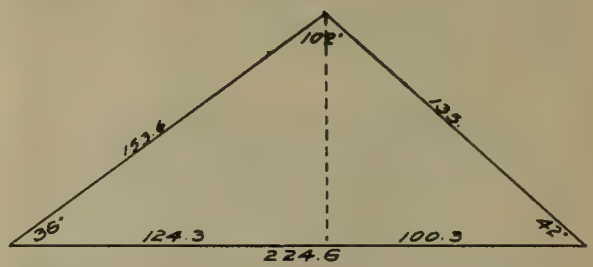
Under the angle 16° first find distance 27, and then 59. Point off properly as above. The horizontal distance is found to be 265.1.

To find the slope distance, the horizontal being given, reverse the above. To lay off 264.4 with an angle of 18°:

Vertical angle.	Slope distance.		Horizontal distance.
18°	270	=	256.8
	8	=	7.6
	278		264.4

Find under 18° the nearest horizontal distance to 264.4. This is 256.8 and gives a slope distance of 270. This leaves 7.6 horizontal (264.4 − 256.8 = 7.6), which equals 8.0 slope. Total distance, 278.0. Vertical distances or departures may be handled in the same way.

Oblique Triangles.—Given three angles and one side. Divide into two right triangles.



Angle.	Vertical.	Horizontal.	Hypothenuse.
42°	130.0	96.6	87.0
	5.0	3.7	3.3
	135.0	100.3	90.3

from this

Angle.	Vertical.	Horizontal.	Hypothenuse.
36°	88.2	121.4	150.0
	2.1	2.9	3.6
	90.3	124.3	153.6
		100.3	
		224.6	

Traverse Table for Stadia Reductions.—There are several methods of reducing stadia measurements. As the horizontal distance equals 100 multiplied by the rod reading multiplied by the cosine squared of the angle read, if we wish the horizontal distance we simply make the calculation twice. For example, 2.4 feet is read on the rod and angle is 14°:

14°	240 ft. = 232.9	230 = 223.2	
		2.9 = 2.8	
		Horizontal distance required	226.0

From an ordinary stadia table the distance would have been 225.96.

For vertical distances, double the angle, and then take half the result.

For 14° and 2.4 feet take angle 28°, 240 = 112.7 by $^1/_2$ = 56.3, which is exactly what the stadia table gives. When both horizontal and vertical are required at once, proceed as follows:

14°	240.0	232.9	
		Horizontal.	Vertical.
14°	230.0	223.2	55.6
	2.9	2.8	0.7
		226.0	56.3

This is much quicker than the multiplication necessary with a stadia table. An even quicker way where many stadia calculations are to be made is to place the angle for stadia readings over the proper column in the traverse table. For example, the results obtained above may for horizontal measurements be found directly in the column under 19° 45′, as the cos. of 19° 45′ is the square of the cos. 14°:

19°45′	240	225.9

This is a little out because 14° 02′ really equals 19° 45′, but the results are accurate enough for ordinary work. In the same way we place the figures representing the stadia angles measured over the proper vertical or departure columns in the traverse table.

made from a traverse table. As an example, take 1 centimetre = 0.3937 inch. Under 23° 11′ in a large traverse table 100 = 39.3675, but in a smaller table 100 = 39.47 under 23° 15′. By properly pointing off, we get 1 centimetre = 0.3947 inches, or for example 81 centimetres = 31.97 by inspection, and any other length by addition and proper pointing as in previous examples. With a large traverse table, 81 = 31.8876 as against 31.8897 by arithmetic. This is nothing more nor less than a multiplication, and any other multiplication or division may be made as well.

Tables of several columns may often be prepared for rapid calculation. Pyrite, FeS_2, contains 46.60% Fe and 53.40%S. Therefore, 100 = 46.60 + 53.40 at the end of the columns, and a rock containing 46% pyrite can be seen at a glance to contain 21.44% Fe and 24.56% S. If the remainder of the rock was, for example, limestone, its elements could be calculated in the same way. Thus mineral tables may be constructed having any number of columns, one for each oxide or element, as the case may be.

Australian Gold Production in 1914

Returns from five of the six states of the Commonwealth are now available, being as follows, in fine ounces:

State.	1914.	1913.
New South Wales	124,507	149,657
Queensland	248,395	263,343
Tasmania	27,320	33,400
Victoria	409,706	434,932
Western Australia	1,232,977	1,314,043

Mining at Santa Barbara

By F. J. DeWILDE

Santa Barbara is situated in the Parral mining district, in the southwestern portion of the state of Chihuahua, Mexico. Parral is about nine kilometres to the west. The mines are situated in the foothills of the Sierra Madre range, the elevation of the shaft collars being approximatly 2500 metres above sea-level. Production from this district is confined mainly to lead, silver, and zinc, although the ores contain some gold and a small amount of copper.

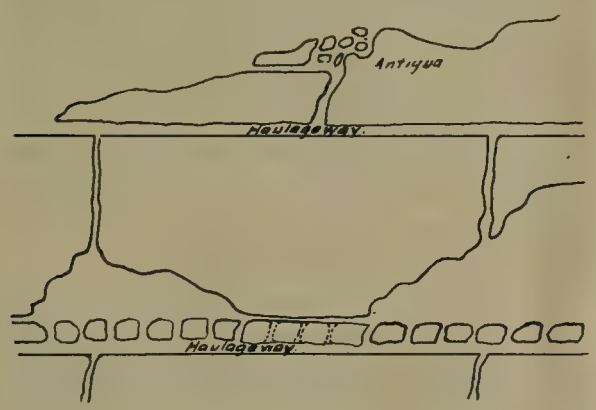
The geology of the district is quite simple. Large veins occur in a flat dipping series of impure limestones, shales and slates. The veins dip west at angles varying from 45° to 75°. Rhyolite and alaskite intrusions are contemporaneous with the mineralization. One large intrusive stock of alaskite divides the vein systems into the northern and southern portions.

The Los Angeles mine and other openings of the Montezuma Lead Co., have prospected the veins in the northern group; those to the south are being developed by the American Smelters Securities Co. at the Minas Tecolotes. The length of the prospected zones is approximately four kilometres; however, only a small portion of this zone was producing while I was employed in the district.

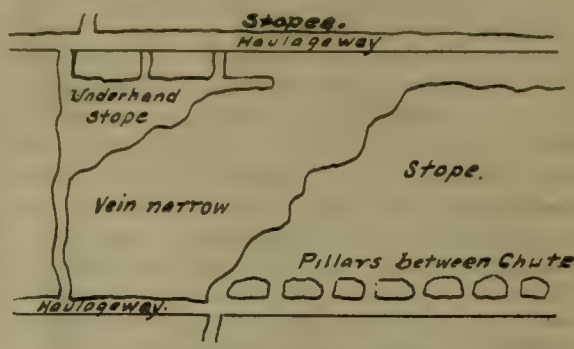
The Tecolotes mine has developed three veins, La Seca, Cabrestante, and Tecolotes, to a depth of about 150 metres below the collars of the shafts. During the early days, numerous adits were driven into the various veins and the richer oxidized ores mined. Antiguas worked by the Spaniards still contain some rich ores. The present Tecolotes shaft has cut the sulphide zone. Galena and sphalerite (associated with pyrite and chalcopyrite) were found in a disseminated form.

Stoping Methods

Because of the great length and width of the veins at the Minas Tecolotes, the shrinkage system of mining has been applied with excellent results. Where a vein has been properly developed by a system of rises and haulageways, stopes are started by driving small subdrifts off each side of a rise about 3 metres above the level. Short rises driven to the subdrifts and spaced about 7 metres apart, form the chutes whereby the ore may be drawn from the stope at various points. As the stope is enlarged, the subdrifts are kept in advance from 10 to 15 metres. Floor pillars are left for the



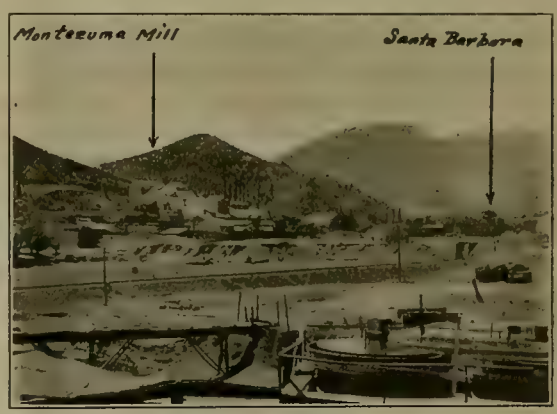
METHOD OF STARTING SHRINKAGE STOPES.



UNDERHAND SHRINKAGE STOPES.

level above and the stope gradually lengthened on each side of a rise until its length is defined either by a contracted portion of the vein or by a rise farther on. (See accompanying illustrations.)

Where a vein contracts and is too narrow for its economical stoping by shrinkage, the ore is mined by underhand methods as follows. Subdrifts are driven off a rise, about 3 metres below a level, and short rises



SANTA BARBARA.

driven to the level at 15-metre intervals to make the stope accessible. As the stope deepens and lengthens, the subdrifts are kept in advance from 10 to 15 metres. The levels are driven at 50-metre intervals and all the drifts are made large enough to permit of electric haulage. No timber is required either for the stopes or rises. The ore chutes are lined with 3-in. plank and open out above the tracks.

At the Los Angeles mine of the Montezuma Lead Co., the veins, although undoubtedly a continuation of the zone to the south, are narrower and therefore are better adapted to the room and pillar system, which has been extensively employed.

Swedish Iron Ore and Steel at the Exposition

Sweden is a busy manufacturing country, and a great deal of its wealth lies in its deposits of iron ore and the water-power available for various industries. The reserves of ore total many millions of tons, and water-power at 6,205,000 hp., of which 750,000 hp., or 12%, is being used. Most of the iron ore mined is shipped to England and Germany, and some to the United States, exports in 1913, a year of normal output and increase, being 6,459,950 tons. There were 104 blast-furnaces, 210 puddling furnaces, 62 open-hearth furnaces, and 17 bessemer converters operated in that year, producing 735,000 tons of pig iron, 153,400 tons of wrought iron, and 582,800 tons of steel. About 30% of this metal was exported. According to the Swedish Iron Workers' Union, which met at Stockholm on February 9, the war and lack of water for power have almost paralyzed their business to all countries. Iron ore exports decreased 1,472,000 tons compared with those of 1913. Only about 50% of the furnaces are in blast. Owing to the lack of water, the works in Sweden cannot manufacture enough even to meet the demands of the reduced Swedish consumption of iron and steel. Thus prices have kept steady and even rising, which helps to make amends for the increased manufacturing expenses, higher coal, increased export rates, increased war insurance, and other factors. Unfortunately, also, the question of the new water rights for power has not yet been settled, so that no ordering of water current can as yet be arranged.

In spite of the war, Sweden has a splendid exhibit at the Panama-Pacific Exposition, and an inspection revealed the following important features in rooms tastefully arranged, one of which is actually 'papered' with steel of all shapes and sizes:

Ore.—A glass model of the famous Dannemora mines, 30 miles northeast of Upsala and 65 miles from Stockholm. These were worked as early as the fifteenth century and are opened to 252 metres' depth. The ore is a 50% calcareous magnetic iron material, free from phosphorus, occurring as lenses in a bedrock of limestone. There is some faulting evident. Some zinc ore is also mined.

Another model is of the Falu mine, which is in central Sweden. It was worked as long ago as the fourteenth century, and is opened to 334 metres. It also produces copper pyrite, gold, and iron pyrite. Years ago the timbering in the central portion of the mine gave way, and a large cave-in resulted.

A relief map shows the Kiruna deposits, surface equipment, and transport arrangements. The ore dips under an arm of the sea in one place, and its existence there was traced by use of the magnetometer, an instrument made in Sweden and shown in the pavilion.

Samples of ore are displayed in a case in the centre of one of the rooms, and surmounting the case is a block of 72% iron ore weighing 5½ tons from the Kiruna mine. Below this block are samples from the following: Klackberg, 69% iron (a representative of Swedish calcareous ores); Gonas, near Ludvika, 43% iron, 0.09% phosphorus, a fairly coarse crystalline magnetite and hematite most suitable for concentration; Dalkarberg, 65.2% iron; Grangesberg, various ores; Malmberget, up to 67%; Stripa, a quartz-banded hematite with 50% iron and low in phosphorus; and Persberg, 55.8%, a self-fluxing magnetic iron ore from which a great part of the Swedish iron production is made, occurring on a bedrock of dolomite and liparite.

As so much ore is exported, it is natural that the handling and arrangements at the sea docks are capable of efficient work, and models of the old and modern types of ore docks and steamers are shown. The vessels differ from the ore carriers on the Great Lakes of America in this respect, that the holds consist of a number of V-shaped hoppers which empty into a skip at the bottom of the ship, which is then hoisted to any desired place by means of winches and derricks on the deck.

Smelting by electricity.—Water-power being in abundance in Sweden, the use of electricity in smelting has been tested to a considerable extent. A model of the Jernkontoret's electrical research blast-furnace at Trolhättan is shown. It is thoroughly constructed one-tenth of the full size. The furnace capacity is as follows: yearly production, 7500 tons of pig iron; charcoal consumption, 25 hectolitres per ton of ore; electrode consumption, 3 kilograms per ton; and electric energy, gross, 2500 and net 2200 kw.-hours. Some idea of the size of the operating furnace may be gained when it is said that the four electrodes are 30 in. square each.

Steel products.—The varied steel products for peaceful and warlike use are too numerous to detail here, suffice it to name a few, as follows: The Sheffield of Sweden is at Eskilstuna, near where are no mines, but the steel is worked up to the finest cutlery, knives, saws, files, scissors, and tools; spring steel, Sandviken and Uddeholm; structural iron, Domnarfvet; cast steel, Johannson; drill steel for mines, hollow, Forsbacka and Hofors; drop forgings, Laxo; drop forgings and tool steel, Osterby and Kohlswa; tubes, cables, etc., Fagersta; axes, Hult; and guns and projectiles, Bofors and Wirsbo. Samples of air-hammers, De Laval turbines, and other useful apparatus are shown. An interesting display is one of a new product, known as 'iron sponge.' By a chemical process the iron from low-grade dumps is recovered. The resulting 'pigs' are light, but when forged produce the best workable iron.

Sweden has large forests, and an exhibit shows the charcoal, tar, turpentine, wood alcohol, and wood by-products which are a source of wealth.

DEMAND for iron and steel in Canada is at present confined to a few grades, the Canadian steel works being largely occupied with government contracts. It is estimated that the mills now hold orders for $80,000,000 worth of shells.

Flotation: Its Sphere of Usefulness in Gold Metallurgy

By W. B. BLYTH

*The application of flotation to the concentration of gold ores is only a question of time. Already plants have been erected in this connection, and operated (so it is said) successfully. The process has reached the stage where its sphere of usefulness is not confined to the base metals. It must be recognized as a commercially applicable process by gold investigators also, and it is as well now to consider its possibilities. In the first place, being a concentration process, it is of value only where the valuable constituents of the ore are in the mineral, or when some refractory mineral is present in an otherwise free-milling ore, and it is desired to remove that mineral subsequent to cyanidation. In this latter connection the flotation process seems to have an extended field of usefulness in the preliminary concentration of cupriferous gold ores. These have been a bugbear to metallurgists for many years, not because the copper interferes with the dissolution of the gold, but because it consumes so much cyanide during the process. A small percentage of chalcopyrite will render the treatment of a low-grade gold ore unprofitable under existing conditions. The flotation process will remove the copper in the form of a marketable concentrate, and will do it effectively and at small cost. The remaining pulp will be in a fit state to undergo ordinary cyanide treatment. It is doubtful if it will ever pay to float mineral from an ore that yields its gold readily in an all-sliming process. It must be remembered in this case that the mineral that is slimed in a circulating cyanide solution during crushing will yield its gold by simple, inexpensive agitation. The coarse mineral can be removed, classified, and slimed in the usual manner, and the slimed product mixed again with the rest of the pulp prior to agitation. If the mineral is floated off, then the same ultimate procedure must be adopted with the floated portion. The additional expense of flotation will be incurred, as against the cost of agitation and filtration of a large proportion of more or less barren tailing. The latter will generally be found the cheapest and least complicated process. When studying the features of roasting refractory floated concentrate prior to cyanidation, it must be remembered that the standard flotation process is particularly efficacious in floating mineral slime. As tables do such excellent and cheap work in separating the coarse mineral, it may be said that, as regards gold ores, the chief field for flotation lies in the concentration of refractory slime. It must be borne in mind that the roasting of slime from a cyanidation standpoint is a difficult problem, and one that, as far as my information goes, has never been solved. The process of drying slime leaves lumps, and these lumps, however small, will never roast perfectly sweet. There is a vast difference between a cyanide roast and the roasting of lead and zinc concentrates prior to smelting. Filter-pressing and air-drying, followed by disintegration of the concentrate prior to roasting, might get over the difficulty. I would like, however, to emphasize that it is a problem in itself, and to warn investigators that the mere fact of being able successfully to float the valuable mineral in a given slime does not indicate that it can be successfully treated unless there is a smelter handy to buy the concentrate. In many cases in Western Australia the mineral constituents of the ore are so fine, and so intimately mixed with the gangue, that the whole ore must be reduced to a colloidal slime before the mineral is liberated. When liberated, the mineral in this kind of ore can be readily floated. Kalgoorlie ore, worth $9.60 per ton, can be readily reduced to 72c., with the production of from 10 to 15% of concentrate, in this manner. The expense of reducing to colloidal slime, however, is heavy, and this, as well as the question of the subsequent roasting prior to cyaniding of the floated slimed concentrate, does not make the undertaking a very attractive one. I consider that flotation will certainly occupy a prominent place in gold metallurgy during the next decade, but predict that there will be many commercial mistakes made in its application during that period.

Profitable Use for Old Hammer Drill

MACHINE-DRILL USED AS A POWER HAMMER IN SHOP.

The accompanying picture shows a 3¼-in. Ingersoll-Rand hammer drill, serving the purpose of a power hammer in the Jewel-Denero smithy, near Greenwood, British Columbia. A drill of this kind, so arranged, is extremely useful for doing light power-hammer work, where the installation of the ordinary machine would be out of the question because of the capital investment and power required, according to C. A. Banks.

Centrifugal v. Reciprocating Pumps

*There are certain valid reasons why centrifugal pumps were installed at the Durban Roodepoort Deep instead of reciprocating pumps, and it may be of interest briefly to state these reasons.

Initial cost.—The capital cost of a centrifugal pumping plant, complete with motor, starter, and combined bedplate all delivered at Johannesburg, is approximately 60% of the cost of a reciprocating pumping plant, assuming conditions similar to those at this mine, which calls for 800 gal. per minute against 2500-ft. head. For a 2000-gal. per minute plant against 2250-ft. head, the centrifugal pumping equipment becomes 40% of the cost of reciprocating pumping equipment.

Weight of plant.—The centrifugal equipment weighs approximately 70 lb. per gallon of water pumped per minute. A reciprocating equipment would weigh approximately 350 lb. per gallon.

Reliability.—This was an unknown figure when the pumps were installed, but the authors were of the opinion that, in spite of a considerable amount of hostile criticism, the centrifugal pump was reliable if it had fair treatment, and the results of a year's run have confirmed this opinion, as there has been no trouble of any sort experienced with the pumps since they were installed.

Cost of maintenance.—This also was an unknown figure, and here again the authors believed that with clean water the maintenance costs could be reduced to a reasonable minimum.

Cost of excavations for pump chamber.—The larger the quantity of water to be handled, the bigger the proportional saving by using centrifugal pumps. Taking the Durban Roodepoort Deep plant as approximately 800 gal. per minute capacity, the net excavation for the pump chamber would be, allowing for no further installation of plant, 8000 cu. ft.; for a reciprocating equipment of similar capacity the excavation would be approximately 55,000 cu. ft., or the ground to be moved for the centrifugal equipment would be approximately 15% of that for the reciprocating pump. For a 2000-gal. per minute plant the excavation for a centrifugal equipment would be approximately 10% of the cost of excavations for reciprocating equipment. The figures are shown in the following table:

COMPARATIVE SIZES AND COSTS OF PUMP CHAMBERS

Capacity of plant.	—Centrifugal pumps—		—Reciprocating pumps—	
Gal. per minute.	Excavation, cu. ft.	Cost of chamber.	Excavation, cu. ft.	Cost of chamber.
800	8,000	£200	55,000	£1,375
2,000	13,000	325	130,000	3,200

We carefully studied several makers' drawings for the reciprocating pumps before compiling this table, and selected those pumps which occupied the smallest space for their capacity. If the figures given can be improved on in any way, the authors will welcome a correction, as they are anxious to be perfectly fair to both types of plant.

The above are the general points which appeal to the authors as indicating the merits of centrifugal pumps for high lifts, and after a year's experience with the particular plant under discussion there are other favorable features evident which cannot be assessed in cash or figures, such as (1) simplicity of repairs and replacements, (2) smoothness of running, and (3) minimum of attention required during operation, and other points which are beyond the scope of this paper.

*Conclusions in paper on the 'Centrifugal Pumping Plant at the Durban Roodepoort Deep Mine, Transvaal,' read by E. G. Izod and A. D. Roullard before the South African Institute of Engineers.

Costs at the Wasp No. 2 Mine

In 1914 this South Dakota property produced 176,140 tons of ore by open-cut work and simple cyanidation.

Costs were as follows:

	Total.	Per ton.
Mining:		
Labor	$ 56,434	$0.3204
Stripping	24,613	0.1397
Supplies	7,643	0.0434
Power	3,074	0.0174
Explosives	10,694	0.0607
Stable	2,253	0.0128
Repairs, machinery	1,699	0.0097
Repairs, tramway	1,548	0.0088
Superintendence	2,286	0.0130
Sundry expense	1,316	0.0075
Coal	3,512	0.0199
Surveying	184	0.0010
Prospecting	1,183	0.0067
Total	$116,439	$0.6610
Milling:		
Labor	$ 38,126	$0.2165
Supplies	12,857	0.0730
Power	15,154	0.0860
Repairs, buildings	48	0.0002
Repairs, machinery	10,509	0.0597
Superintendence	2,286	0.0130
Sundry expense	1,316	0.0075
Coal	697	0.0039
Cyanide	14,584	0.0828
Zinc	5,138	0.0295
Lime	1,499	0.0085
Assaying	1,825	0.0104
Total	$104,089	$0.5910
General:		
Repairs buildings	$ 73	$0.0004
Bullion expense	1,384	0.0079
Insurance	2,884	0.0164
Taxes	1,426	0.0081
Interest and exchange	88	0.0005
Assessment work	300	0.0017
Total	$ 6,155	$0.0350

RIVERS of the United States carry to tidewater every year 270,000,000 tons of dissolved matter and 513,000,000 tons of suspended matter. This total of 783,000,000 tons represents more than 350,000,000 cu. yd. of rock, or 610,000,000 cu. yd. of surface soil.

DISCUSSION

Readers of the MINING PRESS *are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.*

Who Will Engineer the Engineers?

The Editor:

Sir—I would like most respectfully to call the attention of 'A Engineer' and his collaborator 'KCN Engineer' to the list of engineers and their wives who attended the annual dinner of the American Institute of Mining Engineers in New York city, February 15, and to ask them, also most respectfully, if they cannot find it in their hearts to qualify, mollify, or ameliorate their statements somewhat, which are to the effect that an engineer hangs a "millstone around his neck" when he marries.

The writer, a married man, has observed that marriage to the right girl is more likely to act as a life preserver than a "millstone." Also that jobs worth having usually carry quarters in which the right kind of a woman can make a home. The mere fact that fifty per cent of mining graduates seek other professions signifies little, for it takes stamina as well as gray matter to mine.

The fact that the gentlemen who started this discussion withhold their names is strong evidence that even they are not yet ready to burn their bridges behind them. The query "Who will engineer the engineers?" could come only from an unmarried engineer.

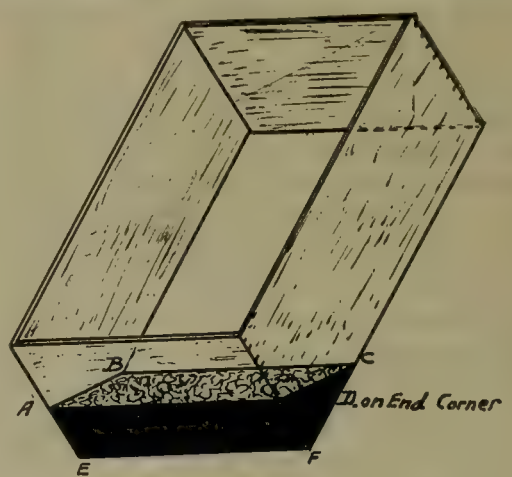
CLYDE M. BECKER.

Rincon, New Mexico, March 20.

Practical Points on Sampling

The Editor:

Sir—Referring to Arthur Feust's interesting article on this topic, in the March 6 issue of the *Press*, I would offer the following as a method which obviates the objection he raises to the use of a 'standard volume,' that of the 'double transfer.' In practice, after I have decided on the weight per foot of sample that I wish to obtain, I select a face of as representative ore as possible, and cut a 1-ft. sample to the weight required. The chippings are caught in a powder box. If in cutting the sample some of the chippings are above the average size of the whole, I break them so as to obtain as nearly an average size as possible. I then shake the sample into one end of the box, as is shown in sketch, until it occupies a space as nearly equal to a right prism as it can be made to do. The lines of contact with the end, sides, and bottom of the box are then marked on the inside with a pencil, as shown by A–D, A–B, D–C, and B–C. Then throwing out this sample, another 1 ft. is cut and treated in the same manner, and the operation repeated until lines representing the spaces filled by three or more 1-ft. samples are obtained. The mean of these is taken, and the lines representing it are scored, on the inside of each box used in the sampling, by a knife or chisel. By this means one obtains as fair an approximation of volume as is possible. It is always marked in the boxes used by the sampling gang, and every foot as cut can be brought to the right proportion by simply shaking it into the end of the box, and seeing if it is sufficient to fill the space required. If not, the sample is re-cut until the



necessary quantity is obtained, and then transferred directly to the sample sack. Parts of a foot in a sample length can be gaged by the eye. The method is capable of variation according to individual judgment, but is submitted as a means, which I have used with great satisfaction, of obtaining as uniform a volume per sample foot as is reasonably possible, as it eliminates any guess work whatever. It is not original on my part and has been evolved by me from various suggestions and ideas gathered in the course of my work.

WILSON W. HUGHES.

Los Angeles, March 10.

The Copper Beds of Coeur D'Alene

The Editor:

Sir—Let me hasten to reply to James C. Ray's criticism in the February 20 issue. I am not a college or mine school man. Left alone at the age of seven, life has been too strenuous to have learned the art of mapping. The most of my experience has been won

as a prospector, and paying for ventures in mining out of my own funds. I cut a section from plate 2, *Professional Paper* 62, sending it in for a guide. In this I imitated the old millman. He couldn't draw, but he 'doped out' a mill flow-sheet by pasting pictures of machines cut from manufacturers' catalogues in the correct position, as he saw it, and this made a successful and eminently practical copy for work. This was after the 'perfesh' had used quantities of ink and paper on rank failures.

The article was written to be understandable by the average steel pounder, and not for a society of 'high-brows.' The editor's map agrees with the facts in the field. Today all sorts of people usurp the term mining geologist. There is the apex litigation man and the thin-section man, both of whom generally inhabit the cañons of a large city. These should be classed as 'economic geologists.'

What is a mining geologist? He is a trained prospector, the link between the areal geologist—who has his uses—and the practical miner. He interprets the structure as given by the areal man, in the understandable terms of the miner, pointing out the shortest route to profitable ore. His function is to keep technically trained mining engineers from spending funds on useless development, and his earnings should be commensurate with what he saves—which they are not. Did you ever hear of an 'economic' geologist earning a fee by advising a hard-rock contractor the figure per foot he should bid, on what would be encountered in a 200-ft. contract?

In an apex suit "economic geology may be progressing toward an exact science." Its chief use is to befuddle the poor judge anyway, but mining geology is not in that class. In the field we will be wearing out shoe leather for the next hundred years, solving its many problems. If it is near to an exact science, why is it not taught in the schools?

Mr. Ray criticizes my presentation "of the first or top 350 ft." of the Revett holding the copper beds. The "first or top" can be reached soonest by an adit, and putting it that way stimulates the miner, particularly as the portion beyond that is harder than the hobs, etc. What's the use of adding to his agony by giving the high-brow interpretation?

Again, he says I've mixed the Snowstorm and Sonora faults. Have you ever run up against the, "well, the survey puts it there, but when we arrived it wasn't there"? What a comfort it would be if Dame Nature followed survey or straight lines. They wouldn't need mining geologists, only surveyors. But she doesn't. She hates them worse than she abhors a vacuum, and one sometimes thinks the dear old girl was bibulous in her wanderings. In mining terms, the faulting mentioned is along a sinuous line following the trend of the syncline.

What evidence has Mr. Ray that "the metallic sulphides were introduced after the metamorphism of the Algonkian sediments"? I tried to make clear in my manuscript that impregnation was coincident with metamorphism along with migration. I differ decidedly from F. L. Ransome and F. C. Calkins on this head, and hope to discuss it in a future article if I can muster courage to face the 'high-brows.'

As for A. F. Rogers, he certainly got his samples salted. The shipping ore of the Snowstorm is not tetrahedrite. The mine has milled and shipped over a million tons of copper ore, enjoying a low treatment rate because of its high silica, low iron, and the purity of its chalcocite. If the tonnage had contained an undue portion of tetrahedrite, with its uncertain and deleterious compounds, Mr. Smelter Man would have reminded them of the fact by an increase in treatment rates. You can't judge a million tons by a single one-inch thin rock section, and it is extremely bad practice basing one's opinion of seven miles of ore occurrence on a couple of sections. However, it saves shoe leather. Again, sericite is conspicuously absent from the copper beds, and this also proves that Mr. Rogers' samples were freaks.

The ease and celerity with which the city economic geologist can solve problems in the rarified air of a many-stored building is a constant marvel to the man in the field. The latter finds shoe leather a costly item, doing like work, and how often it is that his presentations of meritorious ventures are turned down by the former when advising investment. What is the combination? How does he do it?

GEORGE HUSTON.

Kellogg, Idaho, February 22.

[Having been in the field with the 'high-brow' geologists whose comment has disturbed our correspondent, we can assure him that the rarified atmosphere of the city cañons has had no weakening effect on their leg muscles, and that one wishing to save shoe leather would be well advised not to attempt trailing either of them.

Seriously, we do not sympathize with the attitude of mind so common among 'practical' men who assume that a professional geologist or other worthy bearer of the much misused title of 'expert,' is one who adopts methods of investigation on the basis of the relative amount of work involved. Pray, gentlemen, be fair about this. Our methods of approach may differ, but what warrant is there for assuming the other man is lazy because he works with a miscroscope rather than a pick? This assumption is a common one which vitiates much otherwise excellent argument—even in the sacred precincts of so 'high-brow' an institution as that of Mining and Metallurgy which flourishes in London.

It is not entirely fair to expect from the man who has made his own way up from the ranks, the same nice choice of words and the same precision of statement as from university graduates. He should be able to state his points clearly and to use understandingly the words he does write, but granted this, it is his message that is important. In this case the particular matter is whether or not certain faults do or do not occur

in certain designated places; what, assuming that they do, has been their influence on mineralization; and on the identification of the minerals in the ore. Has anyone further evidence on these points? —EDITOR.]

Electric Smelting at Tyssedal

The Editor:

Sir—In the *Press* of January 30 and February 20, I am pleased to note the corrections of Mr. Struthers and Mr. Crawford in connection with my statements regarding the Johnson electric furnace and the use of coke as a reducing agent by the Noble Electric Steel Co. My reference for the statement regarding the experimental run at Hartford, was the *Press* of March 21, 1914, page 480, in which it is stated that 17 tons of zinc ore from Colorado was smelted in January. In stating the amount of ore smelted, I merely wished to indicate the extent and size of work being done with the Johnson furnace in the electric smelting of zinc ores, which is further emphasized by the more complete account of the 42 days' run by Mr. Struthers.

It is evident, as Mr. Crawford states, that the use of the words 'finely ground,' in connection with the experiments at Heroult, might give an erroneous impression regarding the size of crushing for the coke. I did not intend to convey such an idea, as my impression received from the account of the experiments was of coke crushed not finer than one inch.

A few notes regarding the Hardanger Electric Steel Co. plant may be of interest. In the illustration, the structure in the lower left hand corner is the furnace building. At the right of this building, higher up the hill, is the roaster building, containing a Peterson shelf roaster of 27 tons daily capacity, which was used for agglomerating the ore and concentrate. At the right of the roaster is the crushing department, with bins. The ore, limestone, and coke were brought to the plant by freight steamers, as the works was situated directly on Hardanger fiord.

One furnace of the shaft type was in operation and another partly constructed. The complete plans of the plant also included two 2500-hp. electric steel furnaces which were never erected. The pig iron furnace had the following approximate dimensions: diameter of crucible, 10 ft.; diameter of shaft at bosh, 7 ft.; and height of shaft, 40 ft. The crucible was lined with a mixture of magnesite and tar, and the shaft with firebrick. The furnace required at full load about 3500 hp.

HARDANGER ELECTRIC STEEL PLANT, TYSSEDAL, HARDANGER, NORWAY.

of three-phase 25-cycle current at 60 volts. The furnace had six amorphous carbon electrodes of 24-in. diameter. The production of pig iron was much less than that obtained in the same type of furnace with charcoal as a reducing agent, being 2 tons per horse-power year. Power was purchased from the power plant of the Aktieselkab Tyssafaldene, about half a mile distant at Tyssedal, at a rate said to be $8.10 per horse-power year.

The pipe-line of the power plant is shown in the upper left hand corner of the view. The total head is about 1400 ft. The total possible development of the power-site is 125,000 hp., of which 86,000 hp. is now developed in four units of 13,500 hp. and seven units of 4600 hp. The power company has an electric furnace plant of 400-hp. capacity for experimental smelting of ores and production of ferro-alloys. The greater part of its power is used by the carbide plant of the Alby United Carbide Factories, Ltd., and the cyanamide plant of the North United Cyanamide Co., affiliated companies; both at Odde, four miles up Hardanger fiord from Tyssedal. These two plants take 50,000 hp. The yearly production of calcium carbide at this place is 50,000 to 70,000 tons. The electric furnaces are built in units of from 1500 to 2000 horse-power.

ROBERT M. KEENEY.

Cornucopia, Oregon, March 6.

OPERATIONS of the Crown Mines properties on the Rand in January were as follows:

Stamps working	660
Tube-mills working	25
Number of working days	26.8
Ore crushed, tons	191,000
Gold from mill, ounces	38,870
Gold from cyanide plants, ounces	15,169
Estimated value of output	$1,085,000
Estimated profit	336,000

CONCENTRATES

Readers of the MINING PRESS *are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.*

DAYLIGHT can be seen at the portal of the Snake Creek tunnel, Park City, Utah, from the face which is in over two miles.

ORE CONTAINING carbonaceous material caused premature precipitation of gold in the Porcupine-Crown mill, Ontario, during February and October of 1914.

EXCAVATION at Panama canal in January totaled 1,229,709 cu. yd. of earth, rock, gravel, and sand. The steam and hydro-electric plants produced 3,228,968-kw. hours. The Balboa air-compressor plant compressed 207,096,712 cu. ft. of free air to 105-lb. pressure.

COST of assaying cyanide bullion, preceding purchase, is generally higher than the cost of assaying amalgamation gold on account of the reduplication of results in the former case. In some cases cyanide gold is refined by a cupellation process before leaving the works. Among the advantages of this method may be mentioned the facts that freight charges are reduced, and all refining fees are avoided.

THERE can be no question but that the locator of a mining claim has the legal right to fence and cultivate his claim, so long as he does the necessary assessment work to preserve his title under the mining laws. He should, of course, bear in mind that if he ever expects to obtain a mineral patent on the claim, the burden will be on him to show that the land covered by it is more valuable for mineral than for agricultural purposes and that if he devotes most of his energies to the agricultural development of his ground it may militate against such a showing. But the ground is his so long as he complies with the requirements of the mining laws, and he may use it as he sees fit.

THE FOLLOWING CONCLUSIONS may be set down regarding the production and prevalence of rock dust in the Joplin sheet-ground mines of Missouri, according to a report by A. J. Lanza and Edwin Higgins: (1) rock dust is produced by the blowing of dry holes, squibbing, boulder popping, drilling without water, shoveling, tramming, roof and pillar trimming, and the dumping of the bucket on the surface; (2) each mine constitutes practically one large open chamber, which allows the dust to disseminate more quickly than would more restricted workings; (3) while the amount of dust in the air is not comparatively large, practically every man underground is exposed to a dusty atmosphere during his entire shift; (4) most holes are drilled nearly horizontally, these producing less dust than those drilled upward; and (5) the rock dust particles are derived almost entirely from flinty chert which breaks with splintery and knife-like edges.

MANY METHODS for the determination of gold or silver, or both, in cyanide solutions have been published, which with care in manipulation, and modification in some cases, will give results that are satisfactory. It is possible to classify or group these methods as follows, according to L. W. Bahney in the *Bulletin* of the A. I. M. E.: (1) Evaporating the solution in a porcelain or agateware dish containing litharge, or in a 'boat' made of lead foil; (2) forming a lead sponge containing the precious metals by means of zinc-shavings, zinc-dust, or a piece of aluminum; (3) decomposing the cyanide solution with an acid and precipitating the precious metals by the use of one or a combination of some of the following: copper sulphate, sodium sulphite, hydrogen sulphide, or cement copper; (4) precipitating the silver by zinc-dust held in a Gooch crucible, and determination with a standard solution of sulphocyanate; (5) electrolysis; and (6) colorimetry.

MINES pass through interesting stages in their lives, especially those which have produced rich ore for a time. This is illustrated in the annual report of the Crown Reserve company of Cobalt, Ontario, the general manager, S. W. Cohen, making the following remarks: "The Crown-Reserve mine has now entered the third phase of its history. For the first five years it produced practically nothing but high-grade ore (this yielded from 3611 to 4784 oz. silver per ton), and the average cost per ounce (7.508 to 14.027c.) was probably less, and the proportionate percentage of profit greater than any known silver mine in the world. For the past two years, the production has been partly high-grade and partly mill ore (15 to 17.71 oz. per ton), with the high-grade predominating, and the cost per ounce has been moderate (23.02 to 28.95c.). We have now worked out practically all of our large high-grade deposits, and what is left is mostly in the form of mill ore with the high-grade incidental to it. While the eastern portion of the property, only partly developed so far, gives promise of being ore-bearing, the probabilities are that the grade of the ore will not be high. As a result of these facts, namely, the lower rate of production and the smaller proportion of high-grade, the cost of production from now on will increase and the percentage of profit decrease." The output of the property to date is 18,429,141 oz. which realized an average of 54.57c. per ounce, at a cost of 13.675c. per ounce. Dividends amounting to about $5,854,279 net were paid from this production.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

DEADWOOD, SOUTH DAKOTA

MINE TAXATION.—SHAFT ACCIDENT AT THE HOMESTAKE.—GRIER MEMORIAL.—SHAFT SINKING AT THE ECHO.—HEIDELBERG AND OTHER PROPERTIES.

At a forthcoming meeting of the state tax commission, that body will be waited upon by representatives of mining companies who will endeavor to bring about certain modifications in taxation of mining lands and plants. The present custom in South Dakota is to assess property for the purposes of taxation at its full market value. The operators claim this is an injustice. Some of them believe a bullion or production tax would be more equitable. It is also pointed out that the purchase of property by a producing company has been the signal for an immediate rise in the valuation of that property. One operator claims that he purchased some neighboring property for a small consideration, that was assessed at a nominal value, and that the next year it was carried on the tax list at $400 to $500 per acre, even before he had an opportunity to prospect it, and prior to its yielding a pound of ore. These and other items will be called to the attention of the tax commission.

A falling cage in the Golden Star shaft of the Homestake, at Lead, will hamper operations at that opening for some time. The exact cause of the accident is not known; possibly it was a case of overloading the cage. It appears that cage, loaded with steel, was being lowered to one of the lower levels, and when a short distance below the surface it began to race. In a brief space of time it had gotten beyond the control of the engineer and fell to the bottom, 1250 ft., where it crashed into a bulkhead and stopped. The drum continued to spin and the rope unwound and dropped into the shaft, completing a bad wreck. There was no one on the cage, and there were no personal injuries. Otto Ellerman, state mine inspector, was at the 1000-ft. level, and had just rung for a cage to bring him to the surface when the runaway passed.

With contributions to the Grier memorial fund close to the $3300 mark, the committee having charge of the erection is preparing plans and drawings of the proposed location, for submission to sculptors and others desiring to submit sketches and models. The exact design of the memorial has not been decided on, and, in fact, it is proposed to allow the public an opportunity to have a hand in the choice. To this end it has been decided to place on exhibition the various sketches and models submitted, that all contributors may have the privilege of designating their choice. The location agreed upon, is that tract of ground between Recreation hall and the Hearst free kindergarten. The surface at this point is several feet below Main street, so it will be necessary to erect a suitable pedestal, and whether this will be surmounted by a monument or a statue of the late T. J. Grier, remains to be decided. It has been suggested that in case a statue is decided on, that it will be placed to face down Main street, toward the Homestake works and the scene of his many years' activity in Lead. The site is particularly suitable, on one of the prettiest grass plots at Lead. It is assured that the memorial will be completed during the coming summer.

That the Homestake has been making numerous purchases of ground south and east of Lead is revealed by a new map of the mining district just completed by Frank S. Peck, of Deadwood. In fact it may be said that the Oro Hondo is almost completely surrounded by Homestake territory, and that some of the Homestake's land is so close to the shaft that J. T. Milliken is now sinking to 2500-ft. in an endeavor to find the extension of the Homestake veins.——At a depth of 240 ft. a station is being cut in the Hidden Treasure shaft, preparatory to cross-cutting west to cut a vein which dipped out of the shaft some distance above. Fred Rossitter is superintendent. ——Everything is in good order at the Anaconda shaft, at Roubaix. This is a new opening, some distance north of previous work, and during the winter the machinery was moved to it and erected.——Station cutting is under way at the Oro Hondo, preparatory to cross-cutting, on the 1500-ft. level. It is planned to do considerable diamond drilling at this level. About 35 men are employed; the force will probably be double this number within a short time. Some hard rock has been encountered, but fair progress has been maintained. Jackhamer drills are used.

With two shifts of three men each, additional to a foreman who frames timbers and other work, the Echo shaft, at Maitland, is being deepened at a rate averaging 2 ft. per day. The shaft excavation is about 6 by 10 ft. It is timbered with 8 by 8-in. sawed timbers, and lagged with 2-in. material. The hoisting compartment is 4 ft. 2 in. by 4 ft. 4 in., and the ladderway 3 ft. by 4 ft. 4 in. Two men are constantly engaged in the bottom, except when timbering and blasting. With a Chicago self-rotating sinker they drill six holes to an average depth of 4 ft. in less than two hours; the holes are blasted, and in 15 minutes 'mucking' is started, after ventilation with a Buffalo fan driven by a 1-hp. motor. It requires an average of more than a full shift to remove the rock broken with six holes. The present plan is to break the shaft with 12 holes; first six cut holes are drilled, blasted and the débris removed, leaving a bench at either end. These are then broken with three holes in each end. Hoisting is done with a 22-hp. electric machine. The engineer acts as top man, dumping the centre swing buckets direct into a car and tramming to the waste dump. Equipment includes Bury 8 by 8-in. belt-driven compressor, a Shaw drill-sharpening machine, and a 24-in. circular saw in the carpenter shop. It is asserted that this shaft is being put down at a lower cost per foot than any similar work in the Black Hills.

GOLD BULLION WORTH $60,000 IN THE U. S. ASSAY OFFICE AT DEADWOOD.

The Heidelberg company has practically decided to install electric power and equip the shaft for continuation to quartzite. The lines of the Consolidated Power & Light Co. are 2½ miles from the shaft, and it is estimated that the construction of a connecting line will cost $3500; however, as this sum will be remitted to the Heidelberg company in 20 monthly installments, it will practically pay the power bill for that length of time. The shaft is now 175 ft. deep. From the main adit

a winze was sunk 57 ft., and a rise made to the surface, making the total depth as stated. Although of rather heavy first cost, it has been decided that the power question can best be settled by securing electricity. The property is some distance from Deadwood, over a road that is not easily passable in the spring months. This would make hauling of fuel for a steam plant almost prohibitive in cost. Development continues to encourage the further expenditure of capital, and it is thought that on quartzite the largest and best bodies of ore on the ground will be found.

HELENA, MONTANA

MINING DEVELOPMENTS OF THE MANY DISTRICTS TRIBUTARY TO HELENA DISCUSSED.—INCREASED INTEREST BY LOCAL AND OUTSIDE CAPITAL.

There are several large combinations of capital being organized in this section, and it is the opinion of well informed mining men that the Helena mining region will give a good account of itself before the end of the year. The large amount of local capital which is going into mining shows the faith of the people in their own properties.

In the Rimini district the Valley Forge property is shipping regularly, and made a substantial profit in January and February. James Breen is getting ready to install a new unit in the mill with which he is working the porphyry dike. He now has 20 stamps dropping steadily, and has 26 men employed. The clean-ups so far have been better than expected.

During the past month Walter Harvey Weed was in Helena for the purpose of making an examination of the Wayside claims in the Scratch Gravel district, and the Hawkeye mine in the city limits, both of which properties are operated by the Helena Mining Bureau. Mr. Weed gave these two properties the strongest possible endorsement, and the Bureau will continue development. It is sinking the shaft on the Blue Bird claim in the Wayside working in ore assaying from $11 to $30 gold per ton. The orebody extends outside of the shaft, and it was his opinion that the shaft should be sunk to a depth of $60 ft., and then a cross-cut driven from wall to wall. The Bureau is financially able to carry the work through to completion, and all stockholders are much pleased with the prospects. The Scratch Gravel district is one of the old gold areas of the state, and several million dollars have been taken out of it. Mr. Weed also recommended a continuation of work on the Hawkeye to a depth of 350 ft., when driving will be started on the vein. Mining activity continues on the increase at and around Helena. In the Scratch Gravel district the Franklin mine is shipping three cars of high-grade gold ore per week, and is on a profitable basis. H. H. Pigott and Thomas Flynn have taken a lease and bond on 160 acres of ground from the W. G. Conrad estate in this district. They are also gathering up claims, making a combination for some outside capitalists who are coming here.——A few days ago a development of good gold ore was made on the Yellow Boy, at the head of Nelson gulch. Some of this ore was so rich that from a few pounds treated with mortar and pan, $110 was secured. The latter grade ore is being worked over at the Tandy mill on the old Shober claim.

The Butte men who have taken over the Souvenir properties, near Park City, purchased the old Shafer mill and are crushing some good ore.——A party of New York men arrived here some days ago and acquired properties in Mitchell gulch, where several good discoveries have been made within the past few months.——A Los Angeles combination is also here negotiating for some large zinc properties.——The York Mining Co., at York, is still running its mill, making some good clean-ups, which it is shipping to the United States Assay Office at Helena.

Charles Whitcomb and associates have installed a steam-shovel and washing plant capable of handling 1000 yd. per day to test the old Murray placers near Winston, owned by Joseph Smith.——Fred Christman and associates have given a lease and bond to some miners from the Little Rockies on the Golden Wedge five claims near Montana City, and work will be started there in the near future.——Scharrenbroich and Madden have bought the Jacquemin properties in the Scratch Gravel district and are now shipping to the East Helena smelter. They are making arrangements to sink a 100-ft. shaft on the big vein to lay out stoping ground.

The Mineral Mountain Mining Co., owned by Oscar G. Beck, Pete Scharrenbroich, Frank Steele, and others, which has been driving a long adit on the properties at the head of Sheep creek, between Cañon creek and Prickly Pear cañon, has cut a large vein of high-grade copper-gold-silver ore and will start shipping at once.

In the Marysville district the Barnes-King company is doing well with the Gloster. This Company has splendid prospects for the future.——Development on the Shannon property, owned by Marlow, Lanstrum, and Holter, is being continued, and is opening some fine orebodies. It is understood that they have refused a good offer for purchase.——The St. Louis company has given a lease on the Nine Hour claim, and the manager announces that within a short time its financial difficulties will be adjusted, and the entire property, including the old Drumlummon, will be again in operation.

In the Radersburg district the lessees on the old Black Friday are shipping regularly, and the Keating property maintains its usual output, also shipping.

PORCUPINE, ONTARIO

SERIOUS POWER SHORTAGE IN ONTARIO.—DOME OUTPUT.—ELECTRIC HAULAGE IN THE HOLLINGER.—WEST DOME AFFAIRS.—MCINTYRE YIELD.—KIRKLAND LAKE DISTRICT.

In northern Ontario, during the summer and fall of 1914, the rainfall was exceptionally light, and as a consequence the hydro-electric plants supplying Cobalt and Porcupine, are suffering from a shortage of water. Cobalt was affected to a greater extent than Porcupine, and the supply of power for the mines was partly cut off several weeks ago. Recently consumers in Porcupine were notified that the power companies would be able to supply only about half the regular quantity. The condition in Porcupine has been aggravated by the con-

PART OF ONTARIO.

stantly increasing consumption at the Dome and the Hollinger mines, where the enlarged plants have necessitated augmented power requirements. The production of some of the companies will be curtailed, but at other mines there are steam reserve plants that will permit of operations being carried on at practically normal capacity. The shortage of power will continue until about the middle of April, at which time the spring break-up is expected to occur. The Hollinger is using its steam reserve plant in order to maintain its output. It is the intention of the Hollinger management to use electric locomotives on the main haulage levels of the new shaft. These levels will be 400 ft. apart.

LONDON

THE INSTITUTION OF MINING AND METALLURGY HONORS T. A. RICKARD WITH A DINNER. COMPLIMENTARY SPEECHES.

I ought to preface my remarks about the complimentary dinner to T. A. Rickard by stating that during war time, ceremonial functions are usually omitted. The Institution of Mining and Metallurgy had decided not to hold the customary annual dinner this year. These occasions are graced by the presence of official guests a member of the Cabinet, for instance, or a President of the Royal Society, besides many distinguished lights in the educational and engineering worlds. Now that the Institution has won its Royal Charter we shall expect to have the Prime Minister or one of the Princes as chief guest. The dinner question assumed a different aspect, however, when it was heard that 'T. A.' was intending to return to San Francisco to resume the editorship of the *Mining Press*. It was felt that the Institution must make some corporate expression of the regret of its members at the impending loss of one who has always been an instrument for good. Therefore it was decided that members should dine together informally and have T. A. as their guest. In addition, a committee was formed by his friends for the purpose of making a substantial gift to represent an expression of their esteem and admiration. The dinner was held on the evening of March 2 at the Café Monico, in Piccadilly Circus. In spite of the darkened streets and restricted means of locomotion, in spite of the fact that hundreds of mining men are at the war or in training, a large and representative gathering assembled. The only soldier in khaki present was Peter Nissen, and you could tell by the expression on his face that he was wondering how he could utilize the blow of his 2000-lb. stamp for pulverizing the enemy. Many of the older members have sons in the army and navy, and it is appropriate to mention that the President, Dr. F. H. Hatch, has two soldier sons, while a third is an army surgeon. The first toast of the evening was 'The Institution,' moved by Sir Robert Hadfield, famous for his armour-piercing projectiles. He referred to the granting of the charter and to the generous response of the profession to the call to arms. He also referred to his first acquaintance with T. A. when the latter was an editor in New York, and asked him to bear to San Francisco the good wishes of British manufacturers for the success of the great Panama-Pacific Exposition. The President then rose to give the toast of the evening: 'T. A. Rickard.' He paid a dignified tribute to the services rendered by T. A. in advancing the interests and promoting the solidarity of the profession, through the pages of *The Mining Magazine* and in other ways. His campaign against incompetent and irresponsible directors, and his demand that mining engineers should be given fuller representation in the management of companies had been for the benefit of the profession. A man of so forceful a character inevitably propounded opinions and views that did not receive unanimous approval or agreement. Dr. Hatch raised a loud and sympathetic cheer from his auditors when he said that probably there was not a man in the room who had not at one time or another differed from T. A. He referred in well chosen words to the picturesque originality of the editorial language that had caused the *Magazine* not only to provide instruction and mental pabulum, but amusement and relaxation also. T. A. had done great service to the Royal School of Mines by creating an efficient organization of the old students. No graduate of the School had proved more faithful to its traditions or had fought more strenuously for its well-being and independence.

The presentation of an illuminated address and a sum of money wherewith to purchase a piece of plate was entrusted to Mr. F. H. Hamilton. Mr. Hamilton used to be editor of *The Star* at Johannesburg in early times, and he was one of Kruger's political prisoners on the occasion when John Hays Hammond, among others, was condemned to death. Of recent years since then Mr. Hamilton has been a financier in London. One of the companies he helped to form was the Spassky, which operates the noted copper mine in Siberia, and was practically the pioneer of the recent movement of English capital into Russian mining. Mr. Hamilton is an unusually good speaker, whether at dinners or at meetings of shareholders, shrewdly humorous, and with the gift of ingenious phrase. He referred to T. A.'s jealous care of the honor of the mining profession, to the vigilance with which he always watched the interests of the public, and to the lucidity of style and the spirit of broad humanity that redeemed from dullness even a technical article. He supposed that if T. A. had ever submitted himself to examination by a phrenologist he would have been told that his combative faculties were sound and in good working order. With regard to the form the presentation should take, one suggestion was a jeweled niblick, but this proposition was unanimously rejected, for they felt it might have awakened memories of too poignant a character, and they did not want to remind him of the only lapses from the straight and narrow way of which they had ever known him to be guilty.

T. A., in replying, was reminiscent of his connection with technical journalism. He told us how his chief interest as a journalist had always been to act as spokesman for the mining engineer and to do his part in improving the status of the profession. He had been touched and surprised to hear it said that he had succeeded in his efforts to raise the status of the profession. To use a golf simile, he was like the man that tried to make a shot and was surprised when it came off; he felt like the man that made an approach put across a bumpy green and saw the little ball drop into the hole. The fact that he had aimed to do so did not lessen his surprise when he 'holed out.' As for his combativeness, he owned to being belligerent but he was not vindictive, he might be one of those people who thought themselves upright when they were only downright, but at least he hoped that no one would impute to him a descent from a long line of maiden aunts.

Thus ended a memorable evening. Probably T. A. never before fully understood the feeling of esteem and admiration with which English mining men regard him. That dinner must have given him one of the proudest moments of his life.

NEW YORK

AMALGAMATED COPPER'S DISTRIBUTIVE VALUE.—A. S. & R. IN 1914.—ALASKA EBNER MINE.

The probability of the early dissolution of Amalgamated Copper has not in any way affected the market in the stock. It was not at first announced that the Anaconda was to acquire all of the stocks and securities in the Amalgamated treasury, as now appears to be the case. This does, however, more nearly reduce 'Copper' to its lowest terms, so that it is fairly easy to get at its distributive value. Without making up figures in detail, it may be said that Amalgamated could give each of its own shareholders two shares of Anaconda and have about 35,000 shares still on hand. In the present market this would represent practically $1,000,000; other items would add $2,000,000 more, or just about enough to make up a final cash dividend of $2 per share.

The annual report of the American Smelting & Refining Co. has just been issued, and shows that the Company earned within $700,000 of its net for the preceding year. The report will be reviewed in a future issue of the *Press*.

The Alaska Juneau syndicate, which was supposed to have underwritten the 400,000 shares of stock to be offered to the public, put a stop to the "as when and if issued" trading in the shares, when the stock had been marked up to $14 per share on this basis. Bernard M. Baruch, who is supposed to have been chosen as syndicate manager, gave out a statement that any anticipatory commitments by traders would be wholly premature, as nothing had been fully passed upon as

between the Company and the syndicate. It is a matter of regret that the United States Smelting, Refining & Mining Co. has not found its development work on the Ebner such as to justify the further carrying out of its plans. The work which has been done includes 4000 ft. of development in vein formation, but this has not been sufficient to disclose the $15,000,000 in net profits, the development of which was one of the conditions on which the United States company took up the Ebner. As the matter now stands, the Ebner interests must repay to this Company $400,000 within a few days, or a right of foreclosure accrues to it. In view of the past history of the Ebner, it may be doubted whether it will be possible for this payment to be made. The Ebner has never been really financed on a basis that held out much hope of real progress. It may be, therefore, that in the end the United States Smelting, Refining & Mining Co. will develop and operate the property. Perhaps the management will have to be content with something less than the designated $15,000,000 in net profits, but certainly it will want to make the property pay its board bill already in arrears.

There has been a considerable spirit of revival noticeable in the Canadian section of the market. The recent work of the Temiskaming, the branching out of the Crown Reserve into the Central American field, and the payment of the regular dividend of 5% by the Nipissing Mines Co. have all contributed as market factors to add to the interest in Canadian issues.

VANCOUVER, BRITISH COLUMBIA

SNOW AND LANDSLIDE AT THE BRITANNIA MINE. FATALITIES. SITUATION OF MINE, PAST HISTORY, AND PROSPECTS.

At about midnight on March 21 a serious snow and land slide occurred at the Britannia mine, on Howe Sound, about 30 miles north of Vancouver. The total loss of life is definitely fixed at 56, including 5 women and 6 children. The loss in property is represented by the total destruction of the entire town, except eight houses. Included in the buildings destroyed are the cook and No. 1 bunk-houses, store, tool and candle-houses, as well as the Company's offices, and serious damage to the upper terminal of the tramway.

The mining town is situated about 3 miles from the beach, at an elevation of about 4000 ft., and is connected with the town of Britannia Beach, where the concentrator is, by an aerial tramway built in two sections, with a half-way station at an elevation of about 2000 ft. above sea-level.

The mine workings are in two mountains, known as the Mammoth and Fairview bluffs, which rise precipitously from a flat basin in which the buildings that comprised the mining town had been built, at about the same level as the portals of the main adits. The workings and upper terminal of the tramway are connected by a long snowshed, because the snowfall at this altitude so near the coast is usually excessive, but the buildings were supposed to be sufficiently far away from the danger zone to be secure. Most of them were built about ten years ago; during that period there has never been any apprehension of danger from slides, and the present awful calamity testifies to the unusual severity of the conditions that caused it, because the avalanche swept down the valley from the base of Fairview bluff for a distance of more than a mile, carrying snow, boulders, trees, and portions of the wrecked buildings, as well as some of the bodies of its victims, almost to the transfer station of the tramway. The calamity is thus somewhat similar to the big slide at Frank, Alberta, which happened about ten years ago, resulting in much loss of life and property, and was followed by the removal of the entire townsite as well as a part of the Canadian Pacific Railway Co.'s tracks to a new site.

The Britannia mine was discovered by some trappers in 1897, was sold to Leo. Boscowitz, a fur-buyer of Victoria, soon after, and in the late summer of 1899 was sold to a syndicate made up principally of Montana men, who organized the Britannia Copper Syndicate. This is capitalized at $250,000, divided into 400 shares of a par value of $625 each. In 1902 control of this stock was acquired by the late George Robinson, of Butte, and Henry Stern, of New York, who commenced development work, erected the tramway, also the concentrator at the beach, and purchased the Crofton smelter, on Vancouver island, built by Messrs. Breen and C. H. Bellinger in 1901. Since then the mine has been developed into one of the biggest copper mines on the Pacific coast, but the Company has been reorganized and the capital increased since the death of Mr. Robinson, when the control was secured by New York interests, headed by the banking firm of Moore & Schley.

A long adit is being driven, with its portal at a little higher elevation than the half-way station on the tramway, and when that has been completed and has cut the orebodies, it is the intention of the Company to abandon the upper part of the tramway, transport all ore through the adit, and take advantage of the opportunity of handling the product, amounting to about 1000 tons of ore per day, by gravity from the mine levels above this main adit, instead of by hoisting as at present. The new adit will be more than one mile long and will develop the mineralized zone, in which the

MAP OF BRITISH COLUMBIA. HOWE SOUND, THE SITUATION OF THE BRITANNIA MINE, IS JUST NORTH OF VANCOUVER.

orebodies occur, at a depth of about 1500 ft. below the present lowest level.

This mineralized zone consists of crushed eruptives and slates occurring as inclusions in the coast granite batholith, with veins and veinlets filled with quartz. The eruptives are in part altered to micaceous schists, and are usually heavily mineralized with pyrite, chalcopyrite, some zinc-blende, and occasionally galena. This zone is about 7 miles in length, with a southeastern strike, and exhibits a width of 200 to 500 ft. of low-grade copper ore. On the Britannia property there are three known orebodies totaling about 3000 ft. in length so far as the present drifts have demonstrated. The average metal content is about 2% in copper and 40c. in gold per ton. The Company was one of the first big copper-mining companies to adopt the flotation process of concentration after unsuccessfully attempting water concentration. About 1000 men are employed on the works and in the mine.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

Juneau

February returns of the mines on Douglas island were as follows

	Alaska Mexican.	Alaska Treadwell.	Alaska United.
Development work, feet	178	831	964
Stock of broken ore, tons.....	14,803	46,954	16,775
Stamps dropping	120	540	270
Ore crushed, tons	17,395	69,185	38,661
Concentrate cyanided, tons...	330	1,509	861
Total gold recovered	$32,662	$142,249	$86,091
Operating expenses	22,867	84,259	28,699
Construction expenses	3,892	8,854	5,703
Estimated net profit	5,577	47,713	26,622

According to D. C. Jackling, who was recently in Alaska, everything at the Alaska Gold mines is in excellent shape. The mill is doing splendid work. Both the tonnage treated and the recoveries are fully up to expectations. When finally adjusted a unit will handle 2500 tons, giving a capacity of 10,000 tons to the entire plant. That the recoveries will be fully as good as determined by experimental results is now certain. The second unit will be ready in 60 days, and the mine will be sufficiently opened at that time to supply the ore for it. The third unit should be started about July 1. The ore now milled is coming from six different and widely separated points in the mine, thus giving a good average to the property, and is holding at nearly $2 per ton, and the mill is treating 1800 tons per day. The quantity for March should be about 40,000 tons. The mill is the simplest and most economical in all points, and the most satisfactory one the Hayden-Stone interests have ever built.

In the suit of Colich *v.* the Alaska Gastineau company for $10,000 damages for injuries, the verdict was in favor of the defendant. The plaintiff was a mine shift-boss, and argued that another set of timber should have been placed where he was hurt, but the defense argued that, being a boss, he should have attended to such necessary timbering.

Tolovana

News from Fairbanks states that encouraging reports are coming from Tolovana. Over 210 claims have been staked, more than half being on Livengood creek. On Wilbur creek, a tributary of the Tolovana river, 60c. per foot ground has been found. Hudson Bros., on Livengood, opened $1.50 gravel, but lost it on driving 22 ft. On 2 Below Livengood, McQueen and Marsh are down 110 ft., with no bedrock. Others are down from 84 to 120 feet.

ARIZONA

Cochise County

Churn-drilling is to be resumed at the Sacramento hill area of the Copper Queen property at Bisbee. Two machines are ready, in charge of C. J. Barkwell.

The Shattuck-Arizona company will resume operations with a full force in a few days. Only development has been done since October 1, 1915, previous to that time ore shipments were 400 tons per day. This will mean the employment of at least 300 men.

Gila County

The heavy flow of water in the Old Dominion mine is being held in check on No. 12 level, and not allowed to overflow to the lower levels.

Mohave County

What is known as the Tom Reed-Gold Road district of this county is attracting considerable attention of late, and Haff and Colwell, of Los Angeles, California, have prepared a preliminary map of the claims, to be followed by a complete plan showing all properties, for the Tom Reed-Gold Road Association. Some details are given as to the operations of the 26 principal companies. In 1914 the Tom Reed produced gold worth $1,101,750, and the Gold Road, $667,375.

A wide body of rich ore has been cut at 460 ft. in the United Eastern mine, which property consists of claims adjoining the Tom Reed.——At 600 ft. in the latter mine a cross-cut is being driven toward the Tip Top vein in ground recently purchased.——The Bi Metal mine was sampled last week.

Pinal County

(Special Correspondence.)—The mill at the Magma Copper Co.'s mine is working regularly. Construction on the railway to connect with the Arizona Eastern line at Webster is progressing at a good rate at both ends.

Superior, March 25.

Yavapai County

(Special Correspondence.)—The Commercial mine was reopened on April 1. Future ore shipments will go to Needles instead of Douglas as formerly.

Copper Basin, April 1.

CALIFORNIA

The hearing on the bills affecting the mining industry in California, which was adjourned until March 26 to allow the representatives of the miners to appear to speak for them, was held on the date set, but no miners put in an appearance. Of operators, Albert Burch, W. G. Devereux, James Parks, John Mocene, C. E. Uren, Webb Smith, C. R. Downs, and others were present. Messrs. Wolfin and Bradley appeared on behalf of the Industrial Accident Commission. In regard to the eight-hour law, the latter stated that they would object to have the men come in and leave the mines on company time, as there would be a tendency to hurry the men, which would lead to accidents. This bill will probably be reported on unfavorably. It was brought out at the hearing that the results which the dust bill and the mine inspection bill are desired to secure will be amply covered by the rules which will shortly be promulgated by the State Industrial Accident Commission, and if the laws were enacted in their present form it would entail additional expense, with no additional advantage. Most of the operators present spoke in opposition to these bills, and they probably will not be reported out of the committee. Mr. Harris, of Kern county, was the only man present who supported the bills. The bill appropriating $5000 for the study of the metallurgy of nickel at the University of California was referred to the Committee on Ways and Means.

Oil production of the state in February was as follows: New rigs, 17; wells drilling, 148; completed during month, 19; abandoned, 1; producing, 6104; and production per day, 246,869 bbl., against 250,528 bbl. in January. Shipments were only 202,190 bbl. per day. Stocks of crude oil at the end of February totaled 60,527,306 bbl. To the end of 1914 California

had produced 761,693,641 bbl., the Midway-Sunset field contributing 177,018,440 bbl.; Kern River, 173,712,101 bbl.; Coalinga, 153,004,536 bbl.; Whittier-Fullerton, 69,718,444 bbl.; Lompoc-Santa Maria, 66,156,141 bbl.; Los Angeles, 47,568,946 bbl.; and McKittrick, 42,078,772 barrels.

Amador County

Twenty of the forty stamps are dropping at the Central Eureka. The wrecked tailing flume has been repaired. The main shaft is being overhauled, after which it will be sunk deeper.

In the case of the Kennedy Mining & Milling Co. to quiet title to two claims in the Jackson townsite, the Supreme Court on March 30 upheld the previous decision of the lower court by which the Company retains full title to the property.

The Argonaut Mining Co. has paid a special dividend of 2½c. per share, in addition to the regular quarterly distribution, making a total of $20,000.

Butte County

The P. B. Steifer Mining Co. is mixed up in another lawsuit; this time Henry T. James, of Los Angeles, alleges an attempt is being made to swindle 800 shareholders by the levy of an assessment, ostensibly for development, but probably for other purposes. The case seems to be considerably involved.

Inyo County

Preliminary work is being arranged at the Wilshire Bishop Creek mine, and E. W. Walter, superintendent, has returned to the property, where two feet of snow is still on the ground.

Nevada County

The second annual meeting of the Golden Center of Grass Valley Co. was held at Sacramento last week, and the president, Rodney McCormick, stated that steady and consistent progress is being made. Revenue for 1914 totaled $118,576, of which bullion recovered contributed about $50,000. Expenses amount to $112,881. The superintendent, Charles A. Brockington, stated that a new steel head-frame is to be erected, and improvements made to surface buildings. Underground development during the 14 months ended January 25, 1915, totaled 2204 ft., with only 12 miners. Over 2000 tons of $18 ore was extracted from No. 7 level and in shaft sinking on the Dromedary and Whiskey veins. The Garage vein was cut on February 1, where it showed 16 in. of quartz showing free gold. The vertical shaft and incline shaft remain to be completed. The pumps have a capacity of 1125 gal. of water per minute.——At 500 ft. depth in the Oustomah mine, at Nevada City, ore worth $100 per ton has been cut. ——The Willow Valley district shows signs of increased activity.

Development in the Native Son mine at Blue Tent is resulting favorably, the vein opened in the lower adit getting wider. ——A new adit is to be driven below the old one at the Arcade on Minnesota flat.

Placer County

The company owning the Dairy Farm copper mine has constructed a narrow-gage line, 9 miles long, to carry ore from the mine to Sheridan, where it will be transferred to the Southern Pacific.——Work has been resumed on the Bellevue and Bullion mines in the Ophir district.——The Red Bird mine, about six miles from Colfax, has been examined by D. F. Godfish of Stockton.

Shasta County

A 5-stamp mill has started crushing ore at the Gambrinus mine on lower Whisky creek, near Stella. The plant contains a concentrator, as the concentrate is rich. According to the superintendent, H. W. Rogers, 3 ft. of $15 ore has been cut on No. 5 level. About $10,000 was spent on the property in the past year.

Trinity County

With plenty of water, Carter and Williams Bros. are ready to start sluicing with two giants at the Coffee Creek gravel claims. Good returns are expected, according to prospecting results.

Yuba County

The Marysville Dredging Co., which is operating two 9-cu. ft. boats at Marigold, contemplates constructing one of 16-ft. capacity. T. D. Harris is manager.——The Solano Wonder mine, near Brownsville, is reported to be again producing good returns.

COLORADO

Lake County (Leadville)

(Special Correspondence.)—The Empire Gold Dredging Co., a new concern, has acquired a tract of placer ground containing about 125 acres that has been proved and 1500 acres that remains to be proved. This ground lies about 10 miles west of Leadville and is known as the Derry ranch. The Company will shortly begin construction of a 6-cu. ft., electrically driven dredge with all modern improvements, including a manganese steel bucket-line. The property has been favorably known during the past few years, but the difficulty in the past has been to secure the ground on favorable terms. The Company will be controlled and managed by the New York Engineering Co., and before the summer passes some data concerning clean-ups, yardage, and costs may be available for the *Press*.

Leadville, March 25.

The Fanny Rawlins Operating Co. has been organized to develop the Fanny Rawlins, in which ore has been opened 150 ft. northwest of the main shaft.——New York people and G. W. Boyce, of the Gordon Tiger mine at Twin Lakes, have secured title to the old Bwlchcogh property in the Red Moun-

BIG EVANS GULCH, LEADVILLE, COLORADO.

tain district. J. M. Vivian, of England, has held the claims since 1896. Work will be started as soon as the weather permits. At a depth of 1500 ft. there is said to be a 4-ft. vein worth $20 to $30 per ton in gold. The mine is opened by adits, and is equipped with a mill.——The Colonel Sellers mine in California gulch is producing about 200 tons of sulphide of zinc, iron, lead, and silver ores per day.——Lessees at the La Plata, on Rock hill, are preparing to ship iron-silver ore.——The Beaton and Boggs lease on Jonny No. 4 is to resume ore production from the lower workings.—— The Western Mining Co. is retimbering its Harriett shaft. ——In the Lackawanna district rich gold ore has been opened, larger in extent than previously.

San Juan County

Lessees at the Little Giant mine, on King Solomon mountain, have opened a shoot for 200 ft., and are shipping to the smelter. They are negotiating for the Contention mill and tramway, which is in the hands of creditors.——Tailing

from the Iowa mill at Atlanta is to be treated by McKenzie and Kanes.——Work is to be resumed at the Vermilion mine near Arkansas Forks.

TELLER COUNTY (CRIPPLE CREEK)

After several improvements had been effected, including a new electric hoist work has been resumed at the Howard shaft of the Mary McKinney property.——Development in the St. Thomas on Raven hill is promising.

IDAHO

SHOSHONE COUNTY (COEUR D'ALENE)

On April 15 the Stewart Mining Co. will pay a dividend of 10c. per share. In 1914 a total of 62½c. was distributed, equal to $773,676. The total to date is $1,383,997.——The crosscut from the main adit of the Ray-Jefferson has passed through 12 ft. of lead-zinc ore. It is 800 ft. below the upper adit, in which there is also a good shoot.——The main shaft at the Success is down nearly 1100 ft., and will be continued to 1300 ft. A Deane pump of 415-gal. capacity per minute will be placed at the bottom. At 1100 ft. the east drift continues on the rich zinc ore.——A 50-ton mill is to be erected on the Amy-Matchless mine, on Pine creek, this spring, according to the manager, Gus Smith. It will cost $16,000.——Work is to be resumed at the Morning mine and mill of the Federal Mining & Smelting Co. The Montana Power Co.'s transmission line has been connected with the system on the property.

The town of Kellogg is considering the installation of its own water supply at a cost of about $125,000. Water from Big creek is suggested, but mining companies have water rights on the creek.

MICHIGAN

HOUGHTON COUNTY (THE COPPER COUNTRY)

Shipping people of Portage lake are preparing for the opening of navigation, which will take place about the usual time.

It is reported that H. F. Key, of Hancock, will ship about 50,000 tons of sand from the old Franklin stamp-mill to Cleveland this season for the manufacture of concrete blocks.

Wages at the Copper Range Consolidated mines were increased 10% on April 1, making them equal to those paid in July.

MISSOURI

JASPER COUNTY

On the Rex land, at Joplin, four drill-holes have entered ore at an average depth of 100 to 105 ft., showing 24 to 34 ft. of 15 to 20% blende and galena, the former mineral predominating.——The highest price paid for zinc-blende during the recent boom was $79.40 per ton for ore assaying 64.4% metal to C. D. Meyers of Springfield. The ore occurs at a depth of 90 ft.——Several companies are prospecting new ground northwest of the Oronogo Circle mine.——Northwest of Oronogo, a company is driving at 125 ft., at which depth drill-holes cut good ore some time ago.

MONTANA

CASCADE COUNTY

The contractors, Clifton and Applegate, for the refinery at the plant at Great Falls, have started excavating with 60 men, a steam-shovel, three dinky locomotives, and dump-cars. Ground to be moved amounts to 110,000 cubic yards.

LEWIS AND CLARK COUNTY

It is probable that the Yellow Jacket mine, near the Big Indian, not far from Helena, will be reopened this summer. A good tonnage of ore is said to be ready for the stamp-mill on the property.

SILVER BOW COUNTY

The Butte Miner states that by May 1 there will be 11,500 miners employed at Butte, who will receive $1,150,000 per month in wages. Other employment will increase this number to 14,500 men. The Anaconda mines have 6550 at present, and other mines 2500.

NEVADA

The report of the Nevada Industrial Commission from July 1, 1913, to December 31, 1914, has been published. The total income for the first 18 months of the Commission was $360,267; compensation expense, $279,127; administration, $39,844; reserve fund, 10% premium income, $37,790; and surplus, $5505. The contributors include 364 from mines and smelters; all other industries, 449; total, 813. The average number of employees within the protection of the act is 10,709, including 7348 in the mining and smelting industry and 3361 in all other industries. The mining and smelting industry contributed 80.5% of the premium receipts, $288,111; and other industries, 19.5%, or $69,792. In the mining industry the average number of employees has been 7348; average yearly premium on each employee, $26.28; total payrolls, $13,125,242. The pension awards made in this industry and required for pending claims, $178,179. The administration expense of the commission has been 11.13% of the premium income. The number of employers rejecting the act has been 364, the largest number being mercantile houses numbering 153. There were 107 hotels, restaurants, and saloons rejecting the act. During the period named there were 1849 accidents reported to the Commission, 986 incapacitated for less than two weeks, and 812 for more than that period. There were 503 disabilities and 29 fatal cases upon which final settlement was made, and 53 deaths from accidental causes reported.

ESMERALDA COUNTY

The Goldfield Consolidated company reports as follows for February: Development, 2926 ft., at $5.90 per foot; ore treated, 29,862 tons; net realization, $168,279; cost per ton, $5.36. Lessees produced 1271 tons of ore valued at $28,442, from which the Company received $14,599, less transport and treatment charges.

LYON COUNTY

The new 100-ton plant of the Rocklin Mining Co., 25 miles south of Yerington, started work on April 1. Mine development totaling 13,000 ft. has developed 70,000 tons of ore, down to a depth of 1300 ft. E. J. Schrader is general manager.

NYE COUNTY

Tonopah mines last week produced 10,723 tons of ore worth $218,974.——On April 21 the Tonopah Mining Co. will pay 25c. per share, equal to $250,000.——Some development in the Montana has been encouraging.——The Extension made a profit of $60,218 in February.——On March 21 the Belmont shipped 131,535 oz. silver bullion.

A valuable article on 'The Cost of Mining and Milling in Tonopah' appears in *The Tonopah Miner* of March 27, written by Jay A. Carpenter. This will be published in the *Press* at an early date.

WHITE PINE COUNTY

(Special Correspondence.)—The Nevada Consolidated company is working at the mine six of the eight steam-shovels and 11 of the 13 dinky engines. All men are working full time and the mill at 75% capacity. The Company lacks power to run more units on account of the agitators (oil-flotation machines) requiring so much more, and is spending $250,000 for increased electric power. While the agitators make a better saving, they do not, as yet, increase the tonnage per day. The old Ward property, 18 miles south of Ely, is being put in shape, some Salt Lake City people (presumably smelter interests) having taken a bond and lease on it. There are more lessees working and shipping ores from the district and county than in many years, and 'making good,' too.

Ely, March 15.

OREGON

The U. S. Geological Survey has issued *Bulletin* 590, dealing with oil prospects in northwestern Oregon. According to C. W. Washburne, the geologist who made the investigation, the chance of getting oil and gas in commercial quantity there is very slight indeed.

Jackson County

(Special Correspondence.)—Another 10 stamps are to be added to the Braden mine near Gold Hill, which is owned by the Messrs. Ray. The mine has been well developed, making this extension advisable.——Lessees at the old Gold Hill found specimen ore recently worth $200. Development in the Blue Ledge copper district, just over the boundary in California, has stimulated interest in the copper claims of the upper Applegate district of this county. The roads are now passable, and miners are going in.——The Cinnabar in Ramsey cañon is being reopened, with A. L. Lewis in charge, after being idle for a year. New equipment is to be ordered.——The Sylvanite mine is also to be reopened by R. W. Ford and others.

Philomath, March 21.

UTAH

Grand County

Extensive placer work is to be done on the Dolores river several miles south from its junction with the Grand river, by Elkins Bros. of Juneau, Alaska, and E. O. Weston of Victoria, British Columbia. J. W. Brengman, of Grand Junction, has been examining some of the ground.

Juab County

Ore shipments from the Tintic district last week totaled 108 cars. It is hoped to have the new Tintic Tunnel Co., for

KNIGHT-CHRISTENSEN MILL AT TINTIC, UTAH.

the drainage of the district, organized in a few weeks. The cost of the proposed 5-mile tunnel will be about $1,000,000. Zinc ore from nine Tintic mines passed through the Utah Ore Sampling Co.'s sampler at Silver City during the past few weeks.

Piute County

Gold ore which is expected to return $1000 per ton has been sent to Salt Lake City from the Wedge company's mine in the Ohio district.

Salt Lake County

(Special Correspondence.)—Although the smoke bill passed the Legislature, it was vetoed by the Governor of the state. It is a pity that such is the case, as it was hoped that the U. S. Bureau of Mines would be able to carry on an investigation at Salt Lake City which would not only enable it to find some feasible means of doing away with the black smoke problem, but would also settle beyond a doubt whether or not the smelter smoke in the Salt Lake valley had any bearing on the black-smoke problem in the city. However, the Governor's veto has put a quietus on aspirations along this line, at least for the time being. The Bureau officials have hopes of being able to take up the problem at some future date, and hope that they will be able to work out some scheme which will enable them to do so.

Salt Lake City, March 27.

In February the Utah-Apex Mining Co. made a profit of $18,056 from 3594 tons of shipping and 9873 tons of milling ore.

The sixth annual report of the Bingham Mines Co. shows the following results in 1914: The Company operates the Dalton & Lark and Commercial mines, also has an interest in the Eagle & Blue Bell of Tintic. The general manager, Imer Pett, reported that the Dalton & Lark return from 29,347 dry tons of lead and copper ore smelted was $160,448 net. Copper ore from the Commercial was 20,433 tons, yielding $50,850 net. The total smelter return was $211,298. Although 10,792 tons more was shipped in 1914 than in the previous year, owing to the metal market receipts were $10,679 less. The Company's net operating profit was $68,281, and dividend from the Eagle & Blue Bell $104,250. The profit and loss account shows a credit of $172,682, from which is deducted $171,711, including $122,677 for miner's depreciation account of ore shipments, leaving a surplus of $971. The total surplus is $104,833.

The new powder manufacturing plant of the Hercules Powder Co. was officially opened at Bacchus on March 29. The capacity will be 1,000,000 lb. of dynamite and 25,000 lb. of black powder per month, with 90 men employed under Stanley B. Moore. The new town of Bacchus is laid out on the latest system.

The Bingham-New Haven Gold, Copper & Silver Mining Co. paid a dividend of 10c. per share on March 8.. This amounts to $22,869, making $674,635 to date.——As soon as the snow disappears, repairs will be made to the upper portion of the Michigan-Utah tramway in the Alta district. It was damaged by fire some time ago.

VIRGINIA

Wythe County

(Special Correspondence.)—The Bertha Mineral Co., controlled by the New Jersey Zinc Co., is down 455 ft. in its lead-zinc mine near the New river, near Ivanhoe. The first lead extracted in this state was mined here over 150 years ago.——S. S. Boggs and Pittsburgh people are developing a promising zinc property, and will erect a 100-ton mill at once.

Ivanhoe, March 9.

WASHINGTON

Ferry County

(Special Correspondence.)—The annual stockholders' meeting of The Western Union Mines, called at Republic, the principal place of business, to take place on February 27, was adjourned from time to time, awaiting arrivals from West Virginia. C. O. Jarrell, of Emerson, West Virginia, arrived on February 26. William Osborne, one of the leading men of the Company (who went back to West Virginia a few weeks ago, and was expected to return with the money to pay the Company's indebtedness, of which $21,000 is owing for labor and over $60,000 for supplies), returned to Republic March 1. J. L. Harper, the promoter and former general manager of the Company, is a large stockholder, and was a director and leading spirit. It is the evident intention of the West Virginia people to drop him. A majority of the stock, including proxies, was held by Jarrell and Osborne. At the meeting the following trustees were elected: C. O. Jarrell, president; William Osborne, vice-president; C. S. Craft, J. H. Hapkins, and Mr. Smith, all of West Virginia; P. P. Otey and G. J. Tompkins, of Republic, respectively secretary and assistant secretary. In the last letter from Republic it was stated that the Company's options had been forfeited. The West Virginia people have departed, and the

debts and installments on the options remain unpaid. It appears to me that the purpose of the West Virginia people is to wind up the Western Union Mines, organize a new company, take up the option of the Republic Consolidated Mines Corporation, and drop Mr. Harper entirely; but whether to pay off the debts of the Western Union Mines is another question.

The orebody on the 200-ft. level of the Ben Hur mine is widening and improving in value. The Ben Hur Leasing Co. shipped seven cars of ore to the smelter since the last of February.——After the change of management in the Knob Hill mine, two weeks were given to development work. Fourteen men are employed, and nine cars of ore have been shipped to Trail, British Columbia.

Republic, March 5.

SPOKANE COUNTY

A total of $495,850 was paid in dividends during March to shareholders in the following companies operating in the district of which Spokane is the centre: Bunker Hill & Sullivan, $81,750; Caledonia, $52,100; Consolidated Mining & Smelting Co. of Canada, $117,000; Federal Mining & Smelting, $120,000; Interstate-Callahan, $115,000; and Hecla, $10,000.

STEVENS COUNTY

(Special Correspondence.)—The United Copper Co., at Chewelah, has been successful with the copper flotation process and is planning for 50 additional stamps, to more than double its mill capacity.

Chewelah, March 26.

Ten mines in the Chewelah district, which either have never shipped any ore or have been closed down for more than a year, will commence shipping during the next three or four months. These are the Blue Star, Security Copper, Juno Echo, Copper Cliff, Chewelah Standard, Hecla, Washington group, Copper Queen, Krug, and Liberty. The Hecla, which came into prominence last year, will install new equipment, all of which is on the ground at the present time. The Blue Star has commenced work on a new double shaft which it expects to sink to the 800-ft. level.

The largest hoist sent into the Chewelah copper district has been received at the Hecla mine. The machine is known as a double-carriage 8⅛ by 10-in. Lidgerwood shaft hoist. Its capacity is two to four tons from a depth of 800 to 1000 ft. Fred Foster is manager.

CANADA

BRITISH COLUMBIA

Ore reserves in the Copper mountain property of the British Columbia Copper Co. are now estimated at 6,600,000 tons, an increase of 1,100,000 tons compared with five months ago. The metal contents average 1.82% copper and 35c. gold and silver per ton. An adjoining property contains 750,000 tons of 1.54% ore.——Three feet of ore assaying 65% lead and 268 oz. silver has been cut at 900 ft. in the Rambler-Cariboo mine.

ONTARIO

A slab of ore weighing 2600 lb., and containing about 4000 oz. silver per ton, was extracted from an open-cut of the Townsite mine at Cobalt last week. It was found only a few feet below the surface.——The Beaver Consolidated has resumed dividend payments with 3c. per share, equal to $60,000. The total to date is $530,000.——The Peterson Lake has paid $43,000 for its last dividend. The surplus at January 31 amounted to $182,380.

MEXICO

SONORA

Reports sent to Nogales on the border, tell of the raids made by Yaqui Indians in the southern part of this state, especially in the districts between Guaymas, Toniche, and Telsa on the Mayo river. Traffic and travel in the Rio Yaqui country is at a standstill.

PERSONAL

W. J. LORING is at St. Louis.

JAMES E. HARDING has returned from Ocampo, Mexico.

ROSS B. HOFFMANN is in London, on his way to Siberia.

C. E. DWYER is now with the Federal Mining & Smelting Co. at Wallace.

J. A. AGNEW passed through New York on his way from London to Nicaragua.

H. E. PERRY, manager for the Chisos Mining Co. of Terlingua, Texas, has been visiting in San Francisco.

A. W. ALLEN has left London for the Argentine, where he will manage a property at Rodeo, San Juan district.

E. H. CLAUSEN has left the Penn Mining Co., of Campo Seco, California, and is now mine-surveyor to the Colorado Mining Co. at Masbate, Philippine Islands.

RALPH STOKES, until recently with the Canadian Exploration Co., has been promoted from the ranks to a commission in the Royal Engineers. He is now at the front.

H. CROUCH, formerly of Grass Valley, California, is at Hilltop, Nevada, where he has charge of the mill and cyanide plant of the Kimberly mine.

WALTER HARVEY WEED is at Butte, Montana, as geological witness in the Anaconda *v.* Pilot-Butte case. He will be at Helena early in April and will go from there to San Francisco.

W. F. RITTER, who for several years has been manager for the Eighty-five Mining Co. at Lordsburg, New Mexico, has resigned his position. A. J. INTERRIDEN has been appointed by the directors as his successor.

Obituary

CLARENCE EDGAR COPELAND, mining engineer, and his wife were killed with 53 others in a snow and rock-slide that demolished part of the settlement adjoining the Britannia mine in British Columbia, shortly after midnight on March 22. Clarence Copeland graduated with honors from the Colorado School of Mines in 1913 and since then had been engaged in professional work on the Pacific coast. He was 25 years old only, and had begun a most promising career. On January 6, 1915, he married KATHERINE NORA HOLLAND, of Seattle, Washington, who died with him. He is survived by his father and mother, Mr. and Mrs. J. S. COPELAND, of Los Angeles, California.

Schools and Societies

The Southern California branch of the A. I. M. E. will hold a meeting on April 8, when lunch will be served, and Algernon Del Mar will read a paper entitled 'Mechanics of Crushing.'

The biennial report of the instructor, Dwight T. Smith, of the VIRGINIA CITY SCHOOL OF MINES, Nevada, states that an average of 23 students attended in 1913-14, compared with 38 in 1911-12. The 'Announcement' of the school briefly describes the courses given.

The executive committee of the COLORADO SCIENTIFIC SOCIETY reports that the membership totals 233, 10 being elected in 1914, and there was a loss of 15 in that period. Of the total, 142 reside at Denver. The revenue amounted to $2036. Cash on hand is $82, against $144 at the end of 1913. New quarters were secured in the Colorado State Museum. The Society's bulletin contains a paper by Richard A. Parker entitled 'The European War and the Mining Industry.'

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, April 1.

Antimony	25 —25¾
Electrolytic copper	15½ 15¾
Pig lead	4.40—5.35
Quicksilver (flask)	$80.00
Spelter	10¾—11
Tin	40 —41½
Zinc-dust, 100-kg. zinc-lined cases	15

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, March 31.—Copper is firm; lead strong, and spelter quiet.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending

Silver worth $141,600, say 290,000 oz. left San Francisco for the Orient on March 27 by the 'Mongolia.' Exports from London to India and China to March 18 totaled £1,457,500, compared with £1,567,500 in the same period of 1914, according to Pixley & Abell. A succession of foreign coinage orders have lifted quotations in London, but Samuel Montagu & Co. say that before higher prices can be maintained, China has to be reckoned with. It must be remembered that not only are stocks in Shanghai extremely large, but also a substantial portion of the stock in London, about £1,250,000, is held on account of the same quarter. A sudden upward rise in the price of silver provokes necessarily a somewhat similar movement of the China exchanges. This movement, in turn, often causes exchange operations that set free some of the silver held on China account in this market. Thus an automatic reaction takes place, more or less effective in proportion to the amount of silver set free, the power of the silver market here to absorb it, and the limits set to sales by the conditions which govern the China exchanges at the time. These considerations throw light on the movements during the third week of March.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Mch. 3	70.00	Mch. 17	80.00
" 10	80.00	" 24	80.00
		" 31	80.00

May	39.00	....	Nov.	55.00	....
June	38.60	....	Dec.	53.10	....

The report of the New Idria Quicksilver Mining Co. for 1914 supplies food for thought on the quicksilver situation. The output totaled 6550 flasks, for which an average of $41 per flask was received. The whole position will shortly be discussed editorially in the 'Press.' A New York daily of March 12 states that an order for 100 flasks was received in New York from Europe on the previous day. The leading dealer was asking $85 per flask on that date.

TIN

Prices in New York, in cents per pound.

Monthly averages.

	1914.	1915.		1914.	1915.
Jan.	37.85	34.40	July	31.60	....

The British Government has prohibited the exportation of tin from the Straits to other than British ports. Efforts are being made to obtain special permits for shipments to consumers in the United States.

While the official figures are not available, the approximate exports of tin from Bolivia during 1914 amounted to 34,624 metric tons. The last three months show a falling off of 36% compared with the pre-war period months. One cargo of 6000 tons was recently sunk.

COPPER

Prices of electrolytic in New York, in cents per pound.

Exports of copper during the week ended March 27 amounted to 11,725,133 lb. The Calumet & Hecla company is reported to have sold out its metal at 16⅞c.——China produced 3,722,800 lb. in February, and Ray, 4,850,000 lb.——The A. S. & R. company earned 6.93% on common stock in 1914, against 7.47% in 1913. Franklin Guiterman, general manager for the Company, recently stated in Denver that the mining industry generally was encouraging.

LEAD

Lead is quoted in cents per pound or dollars per hundred pounds, New York delivery.

During the 12 weeks ended March 20 the Missouri-Kansas-Oklahoma district produced zinc-blende worth $3,241,972; calamine, $174,569; and lead, $403,172. During the week ended March 27, another $5 per ton was cut off the price of ore at Joplin.

New York Metal Review

Unusual influences affected the metal market in March. The demand for copper created by the war continues to be the largest factor in the present activity, although a betterment in home consumption is reported. The latter is not great, but enough to be felt. The exports of copper in March were good, considering all the handicaps, and prices mounted to higher levels. The exportation of tin from England is under restrictions which amount to an embargo, and shipments from there are made most sparingly. There is a great scarcity of the metal, and war prices again have prevailed. Repeated efforts have been made to break the high prices which have been quoted for spelter and a great deal of uncertainty has been created. Lead prices have advanced as a result of the heavy exports, which would have been larger but for the difficulty in getting cargo space on trans-Atlantic vessels. The domestic demand is quiet. English brands of antimony are nearly exhausted here and their prices are nominal. Practically all of the business is in Chinese antimony. Aluminum is weaker. A tremendous export business continues to be done in iron and steel and in certain kinds of machinery for the domestic manufacture of explosive shells. With all the big demand from abroad for war supplies, there is a growing opinion that the cessation of the war is not far off. Machinery manufacturers whose machines are in demand for shrapnel and explosive-shell making seem to hold this opinion, as they are hedging their sales with greater precautions. They realize that wholesale cancellations of orders in case of an abrupt termination of the war would be a serious matter. In the past week between 300,000 and 400,000 tons of pig iron was sold in the heaviest movement of months. Low prices set the buying in motion. It calls for deliveries as far ahead as December.

COPPER

The heavy consumption of copper for war purposes has been maintained. The exports in March were excellent. They aggregated, up to March 26, 25,103 tons. Prices showed an advancing tendency, especially in the latter part of the month. Up to March 17, prime Lake was quoted at 15.25c. cash, New York, but thereafter it mounted to 16c., and higher. Early deliveries of prime Lake were difficult to obtain and choice brands commanded a premium at all times. In general, the domestic demand for electrolytic showed little betterment, although some improvement was discernible near the end of the month. Electrolytic prices stood at about 14.62½c. cash, New York, from March 1 to 9, when there was an advance to 14.75c. cash. On March 17 an upward trend set in, and March 23 the quotation was 15.37½c. cash. The foreign demand called not only for the metal itself, but for many finished products, including firebox plates, copper bolts, brass rods, cartridge brass, disks, etc. Some of the inquiries specified extremely large quantities, but about some of these there was uncertainty, as the inquiries were not direct, or came from persons not known to be responsible. Some of them, however, resulted in business, and the payments were prompt. The base price of hot rolled sheet copper was advanced March 22 to 20¼c., and March 25 to 20½c., by the American Brass Co., which subsequently advanced its quotations for brass products. Exports in February, unlike those of March, were disappointing, as they totaled only 14,778 tons, compared with 26,193 tons in January, and 22,166 tons in December 1914. The February exports were the smallest since the war started.

LEAD

Large exports were the cause of several advances in March. On the first day of the month the New York price went up $1 per ton, making the new quotation 3.90c., and that at St. Louis 3.85c. On March 5 there was another advance of $1 per ton, making 3.95c. the quotation at New York, and 3.87½c. at St. Louis. On March 16 the American Smelting & Refining Co. increased its price to $3 per ton, or 4.10c. New York, and independents made the St. Louis price 4.05c. On March 24, the metal again advanced $1 per ton. The market was strong throughout the month, and more so abroad than here. Exports up to March 26 totaled 3133 tons, and would have been larger had it not been for the difficulty in securing cargo space on trans-Atlantic vessels. Toward the end of March the London quotation was strong at a high enough level to make export sales profitable. The London quotation advanced from £20 3s.6d., March 2, to £23 2s.6d., March 25. The usual spring buying for domestic consumption is slow in getting under way.

SPELTER

Uncertainty has filled the minds of all who have to do with spelter. Prices have soared, declined quickly, mounted again, then again declined. There have been charges of gross manipulation, allegations that the market has been unduly inflated, and also assertions that the recent high prices were entirely justified by a scarcity of spot and prompt metal. Some features cannot be denied. First of all, it is certain that in the open market between 10.50 and 11.25c. was asked in the first 10 days of the month. Brass mill special was quoted higher. Then came a slump based on offerings which were made on the floor of the New York Metal Exchange at fully 2c. under quotations prevailing outside. The metal was offered at 8½c. Ordinarily, few actual transactions are recorded on the Exchange. The market broke, and about 9.50c. was quoted in the open market. Then came a recovery. On March 23 renewed efforts were made to get the market down to a more normal level, and 25 tons of prompt were sold on the Exchange at 8c., while May delivery was offered at 7.62½c. and June at 7.25c., with no takers. On March 24 the Exchange reported the sale of about 75 tons. Probably 200 tons were sold altogether in the interest of those who believed prices to be too high. The broker executing the selling orders is understood to have had about 400 tons for the purpose in view. The outside market quoted 9.50c., despite the selling referred to. The galvanizers are not busy and are buying little spelter, but it is definitely known that some of them would take metal if they could get it at a price which they consider reasonable. In support of the higher prices of the open market, it is asserted that some of the smelters are sold up for April delivery. Up to March 26, the exports of the month totaled 5122 tons. The exports in March 1914 were but 130 tons. Shipments to Europe since August 1914 have been heavy.

TIN

The important features of the month were the small arrivals, and the placing of an embargo on exportations of tin from England. The embargo was not complete, as it permitted shipments under certain restrictions. It was stipulated that a shipper must be licensed by the Government and that his shipments must be consigned to the British consul at New York. The importer must then give a guarantee which will satisfy the consul that the tin will not be exported to any other country. England's purpose is to prevent the exportation of tin to Germany by way of Scandinavia. It is interesting to note that of late several inquiries from Sweden and Norway have been received here, and it has been wondered why the inquiring parties came here instead of going to London, which is their natural market. Up to March 26 only 780 tons of tin arrived here. On that date 2945 tons was afloat, but the time of arrival of much of this is uncertain, as it is coming from the Far East on vessels that have been delayed for repairs. Under the conditions alluded to, the price advanced to 51c. by March 15. February deliveries of tin amounted to 3375 tons. The total deliveries for two months of this year were 5675 tons, against 6900 tons in the same period of 1914. Of the arrivals in February, 3650 tons, 475 tons entered Pacific ports. The total visible supply February 28, 1915, was 14,548 tons, against 13,901 tons January 31, 1915, and 17,308 tons February 28, 1914.

Current Prices for Oils and Candles

(Corrected monthly by Standard Oil Co., California.)

All prices are f.o.b. San Francisco except where otherwise specified, and are subject to change without notice.

Granite Mining Candles.	Per set, cents.	Granite Mining Candles.	Per set, cents.

Roessler & Hasslacher quoted as follows March 12:

Ammonia, anhydrous, in 50-lb. cylinders, per lb	$0.27
Arsenic, white powdered, in 500-lb. bbl., per lb	0.05
Cobalt oxide, black, in 10-lb. tins, per lb	1.05
Cyanide, potassium, 38.4% cyanogen, per lb	0.27
Cyanide, mixtures, potassium cyanide equivalent 39 5% cyanogen, per lb	0.20
Sodium, metallic, in 1-lb. tins, per lb	0.40
Zinc dust, in bbl. 1600 lb	0.12

New conditions have arisen which may temporarily result in the elimination of many German chemicals. The list of unquotable products is increased.

New Machines and Devices

Information based on letters and catalogues from manufacturers.

Caterpillars at the Exposition

The attractive and interesting exhibit of the Holt Manufacturing Co., of Stockton, California, occupies 15,000 sq. ft. of floor space in the Palace of Agriculture at the Panama-Pacific Exposition. Briefly, the display consists of an old English cottage in the centre, which serves as an office, and in the upper floor is a moving picture theatre showing Holt machines at work. Of most interest to mining men, across the aisle from the cottage are shown the Caterpillar '75' and the '45.' The former is an interesting study, being mounted so that the track revolves as in actual work. The motor is shown in full motion, with glass sides to the crank case, cylinders cut away to show pistons and rings, and a glass cover to the gear case. The 45-hp. Caterpillar, the type without a front wheel, is equipped with an electric motor and cable so that it actually moves about on its own tracks and demonstrates its short turning capacity. Another 75-hp. machine, with 30-in. tracks and military equipment, is shown with two 10-ton Caterpillar trailers. Several other exhibits more of interest to farmers are displayed, and the whole is an excellent arrangement showing the capabilities of this system of traction.

75-HP. HOLT CATERPILLAR, TWO-SPEED, WITH 30-IN. TRACK AND TWO 10-TON TRAILERS.

Commercial Paragraphs

The JUST PROCESS Co., of 45 Broadway, New York, shows its 'rapid sampling filter,' or 'silica sponge laboratory filter,' in a leaflet recently issued. The filter is immersed in the pulp sample, connection made through a Wolff bottle with a vacuum line, and a cake of any desired thickness is drawn on the porous cylinder, the clear solution being caught in the bottle.

The PELTON WATER WHEEL Co., of San Francisco, briefly describes a large installation of its products at the Granby Consolidated company's property on Granby bay, British Columbia. Water for generating over 6000 hp. is taken from Falls creek and conducted to tidewater. Ten Pelton-Doble tangential wheels, ranging in size from 3 to 24 ft. diameter, drive air-compressors and blowing engines for mine and smelter operation, and the hydro-electric plant for supplying electric energy to all parts of the property.

The MONARCH ENGINEERING & MANUFACTURING Co., of Baltimore, Maryland, has published *Series* 25 to 38, inclusive. These cover the following apparatus: No. 25, a combination tool-room gas furnace, which includes eight furnaces in one; No. 26, a bell ladle heater; No. 27, rivet-heating furnaces; No. 28, the simplex melting furnace, oil or gas fuel, for melting aluminum, brass, bronze, copper, gold, silver, ferromanganese, gray iron, semi-steel, and other material; No. 27-F, drill-steel forges; No. 28-F, Eclipse heating forge for tool and drill steel; No. 29, Monarch furnaces for the requirements of mines, mills, smelters, refiners, mints, and manufacturers of articles of gold and silver (the double-chamber furnace is used at Tonopah); No. 30, furnace for galvanizing and tinning; No. 31, reverberatory scrap-melting furnace; No. 32, oil burners; No. 33, the double-chamber melting furnace; No. 34, miscellaneous soft metal melting furnaces, using all fuels; No. 35, portable heaters; No. 36, hand pump for all liquids; No. 37 and 37-A, core ovens; and No. 38, the Monarch tilting reverberatory furnace.

In 'Catalogue 12-F' the COLORADO IRON WORKS Co., of Denver, gives some details as to smelting practice and equipments. This publication covers 160 pages, with illustrations and an index. The work deals with ore sampling; lead and copper smelting, including small plants, hot-blast matting furnace, copper matting and converting, hot-blast smelting, and vaporization of jacket water; data required for estimates; the blast-furnace structure in detail; silver-lead blast-furnaces of all types, also all types of copper furnaces; furnace hoods; blowers; blast gates; hot-blast stoves; forehearths; slag-handling apparatus; ore cars; hoists, charging buggies; scales; reverberatory smelting furnaces; Bruckner roasting cylinders; copper converters; and miscellaneous machinery. The whole covers the smelting practice in a practical manner, the result of considerable experience in making plants for widely different ores.

Tube-mills and pebbles were the subject of recent articles in the *Press*, and the use of steel balls for grinding was discussed. The Marcy ball-mill, which uses steel balls, was mentioned in an editorial at the time. The MINE & SMELTER SUPPLY Co., of Salt Lake City, has distributed a 24-page illustrated booklet containing 'Notes on the Practice and Design of Wet Crushing Ball-Mills,' by F. E. Marcy. After numerous tests, the writer has designed a mill which is 4 ft. diameter and 26 in. long inside of the liners, and which produces a minimum size product, an increase in capacity, a low horsepower per mesh-ton, an equal chance for all products, either gangue or mineral, discharging from the mill and creating an accelerating action on the fines as they are produced. The energy available for crushing by steel balls in a ball-mill is three to four times that of flints, all other conditions remaining equal. With the screen arrangement feed as large as 2 to 3 in. may be fed into the mill, and is reduced to 16 to 40 mesh. What is known as the 4, 6, and 8-ft. grate mills have also been devised. Some interesting diagrams show the work of the various mills.

A. LESCHEN & SON'S ROPE Co., of St. Louis, has published an attractive number of *Leschen's Hercules* for March, it being a Panama-Pacific International Exposition issue. As many of the exhibits at the Exposition are exceedingly heavy, the safe handling of these was quite a problem. The Palace of Machinery, in which some of the heavy exhibits are displayed, is equipped with four electric traveling bridge-type cranes. This building is traversed from north to south, its greatest dimension, by three aisles which are 937 ft. long, and the cranes operate the entire distance. These cranes are equipped with 'Hercules' red strand wire rope. They were constructed and installed by the Cyclops Iron Works of San Francisco. Another big undertaking was the installing of the monster locomotives on exhibition in the Palace of Transportation, for which 'Hercules' wire rope was used.

What Mine Supplies Should Cost

MINING AND SCIENTIFIC PRESS

EDITED BY T. A. RICKARD

Volume 110 SAN FRANCISCO, APRIL 10, 1915 Number 15

CALIF. STATE

IT is not lack of appreciation that has debarred us from using this cover recently. On the contrary, we have traced more direct results from our advertisements on this front cover than from any other advertisement. But abnormal conditions caused by the war have temporarily abated our avidity for new customers—75% of our work comes from old customers.

We have recently received a large order for our **Cooper Roller Bearings, Neal's Discharge,** and **Komata Liners** from a group that six months ago fitted these adjuncts experimentally to one tube-mill. They are so well satisfied that, with the exception of two old spares, they are now fitting all their tube-mills with these power-saving appliances.

The Waste of Experience 570

ARTICLES

PROGRESS IN METALLURGY.
By James Douglas 570
The reminiscences of a veteran metallurgist.

THE MECHANICAL EFFICIENCY OF CRUSHING.
By Herman C. Kenney 572
Rittinger's law of the work required to crush ore was accepted for many years. Recently Kick has propounded an alternative and different law. Mr. Kenney considers various cases of the application of these laws and concludes that Rittinger's law appears to have a valid basis and cannot be discarded without further experimental evidence.

CONTINUOUS DECANTATION IN SOUTH DAKOTA.
By Jesse Simmons 575
Continuous decantation is becoming general practice in the smaller mills of this district. Ingenious appliances used at the Golden Reward mill are described.

WAYS THAT ARE DARK.
By John B. Farish 576
Attempts to mislead the engineer who examines a mine offered for sale are all too common, and the best means of prevention are care and a knowledge of what means may be adopted. An engineer of long and wide experience tells the details of some instances which have come under his personal observation.

SMOKE DILUTION AT MIDVALE.
By L. S. Austin 579
Legislation governing the operation of smelters commonly provides that the sulphur dioxide content of the escaping gases shall not exceed a fixed figure. To maintain this, air is blown into the stack in order to dilute the gas.

INFUSORIAL EARTH.
By Samuel H. Dolbear 580
Several different substances are included under the name of infusorial earth, and these are put to a great variety of uses. The material of the highest quality is imported from Germany, but deposits of good grade exist in California, and a large and increasing production is being maintained.

COST OF MINING AND MILLING AT TONOPAH.
By Jay A. Carpenter 583
The daily tonnage produced by the mines varies from 52 to 473 tons; the average content from $8.41 to $21.09 per ton, and the combined cost of mining and milling from $7.42 to $8.93. Net extraction ranges from 84 to 91.95%.

DEPARTMENTS Page.

DISCUSSION:
Milling Gold Ores in Cyanide.
By A. W. Allen 585
A correction of an error.
Valuation of Dredging Ground.
By R. T. Hancock and Edmund Bonella 585
A method of economizing in bush-cutting is pointed out, and the method proposed by E. J. Vallentine is commended.
Precision of Thought.
By Bernard MacDonald and F. H. Mason 586
One correspondent agrees with us, the other differs.
Utah University.
By Robert S. Lewis 586
A protest against reports which have been circulated in the public press.
Rhythmic Precipitation and Colloidal Ores.
By George E. Collins 586
A careful student points out that dynamic action could not produce the structures observed.

CONCENTRATES 587

MINING IN THE FAR NORTH.
Placer Mining on the Seward Peninsula.
By Emil Edward Hurja 588
Dredging for gold and tin is becoming increasingly important on the Seward Peninsula. Our special correspondent sends news of present operations.

EDITORIAL

T. A. RICKARD Editor
THOMAS T. READ Associate Editor

AFTER an absence of six years, and in response to a call from the staff of this paper, I resume the editorship. Assured of the loyalty of those with whom I shared the difficult days of the earthquake-fire, and hopeful of the continued support of the mining profession, I turn to a familiar task with pleasure. To my immediate predecessor, Mr. H. Foster Bain, the *Mining and Scientific Press* is indebted for devoted service; to him also I am grateful for personal loyalty in times of stress.

T. A. RICKARD.

OPTIMISM is speculative. The world needs a large measure of that cheerful tonic in these dark days.

TRULY the Panama-Pacific Exposition is a splendid show, but the chief exhibit is California.

ON April 3 the peso was selling at Monterey, Mexico, at 16 to 1, New York exchange. This sounds like the echo of an earlier day.

RESTORATION of the wage-scale in the Michigan copper region indicates the resumption of normal production and a return to ante-bellum conditions.

WAR teaches co-operation. The present world tragedy gives us a lesson in the efficiency of human solidarity as applied to destruction. It should point a way to the co-ordination of effort for beneficent purpose.

FOREIGN trade is abnormal—abnormally good. Imports are light; exports heavy. The domestic supply of gold is excessive, being about $1,800,000,000. This is far beyond our requirements and portends the granting of heavy credits to Europe.

WITH the abolishment of minimum prices, as established on December 15, 1914, the New York Stock Exchange returns to normal conditions. This marks a great improvement in domestic financial affairs and in foreign trade relations.

APPARENTLY the shipment of copper to neutral countries is now going forward under arrangements satisfactory to Washington and London. The greater demand for the metal in the manufacture of munitions is compensating for the decreased consumption in ordinary constructive work.

CARRANZA and Villa seem bent on killing mining in Mexico. The decrees relative to duties on metals exported, together with the land taxes promulgated at Vera Cruz, are supplemented by the new mining regulations published at Chihuahua. The miner may well exclaim: "A plague on both your houses."

THE council of the British Association and the local committee in charge of arrangements for the next annual meeting, to be held at Manchester, have decided that it is inexpedient under existing conditions to offer the elaborate local hospitalities usual to the meetings of the Association. It is planned therefore to restrict the meeting to purely scientific functions. War teaches many lessons; this is one that may be extended into times of peace.

WE note the passage of a resolution by the Senate, at Sacramento, enacting that the University of California shall assay gratuitously all samples coming from non-operating or undeveloped mining claims. We hope that the Committee on Mines and Mining will kill this proposal. It is an unwarrantable and unnecessary interference with an established business. The assayers in the State do such work efficiently and at a reasonable charge. The Mining Bureau makes qualitative determinations of ores without fee, leaving it to the proper persons to make quantitative or commercial tests. For the University, we hope that it may not be called to enter a business outside its educational functions and compete with its own graduates in the commercial field. The proposal is one that the mining profession will unite in condemning as an example of unprovoked paternalism not at all likely to advance the welfare of the State's mining industry.

Life and Property in Mexico

Two protests, one by the American residents in Mexico City and another by a committee of those operating mines in Mexico, have been addressed to the Secretary of State at Washington. The one deals mainly with the personal safety of Americans at the capital of our disorderly neighbor, while the other exposes the confiscatory character of a drastic decree issued in the North. In the one case it is the ineptitude and bad faith of Carranza that have excited expostulation; in the other it is the greed and tyranny of Villa that have evoked a remonstrance. Truly, affairs have come to a bad pass in Mexico. Making allowance for the personal prejudice of aliens subjected to the discomforts incidental to domestic political chaos, we still find ourselves moved by the complaint addressed by the American colony in Mexico City to the Secretary of State. After four years of fluctuating misrule and persistent disorder, of broken promises and disappointed hopes, they are entitled to protest. They recount their injuries, they describe their ignominy, they recite their indignation. The official reply may be that they ought to have left the country long ago, as they were warned to do; but that is easier

said at Washington than done in Mexico. They went thither under international guarantees and under the protection of our country's flag; we cannot blame them for trying to save their property by remaining on the spot, while expecting some measure of protection from our own Government. We agree with them that "American civilization is on trial," and that the struggle in Mexico "does not represent the efforts of a people to secure liberty and equal rights so much as the clash of personal ambition and revenge."

Our more immediate interest is engaged by the decree of Villa upsetting the regulations under which mining property is held. In the *Vida Nueva*, a paper published at Chihuahua, on March 25, we have the text of the latest pronunciamento on a subject that vitally concerns many of our readers. Title to mining claims is to be forfeited by reason of

1. Non-payment of taxes;
2. Suspension of work for more than 60 days;
3. Deficient exploitation.

As regards the first, many American owners of mining claims have paid the taxes imposed by more than one of the factions claiming to govern the country. The payment of taxes to one *de facto* government does not protect them as against the exactions of its successors. Suspension of work, it is true, involves forfeiture in other mining regions, but only where operations are rendered practicable by protection to life and property. At the present time most of the mines in Mexico are not only lacking in such protection, but the scarcity of labor and the interruption to railway traffic, both due to continued civil war, render continuous operations quite impossible. Moreover, this question of forfeiture on account of failure to operate is to be left to the judgment of the Secretary of Fomento (or Public Works), who is to be kept informed by the mineral agents delegated to act as inspectors in the various districts. Of course, this arrangement creates a veritable incubator of graft and furnishes unlimited opportunity for tyranny tempered by bribery. At the present time, even mines well established and well equipped are finding it hard to operate; what chance is there for isolated and undeveloped properties to escape forfeiture if they are to be at the mercy of individuals appointed by presidents whose term of office is less than a month, and by the various marauders posing as generals in command of revolutionary parties? But Villa's decree contains another proviso, even more pernicious. As our readers are aware, the owner of a mining claim in Mexico, as in South Africa and Australia, has no extralateral rights; his operations are delimited by four vertical planes; therefore, to assure his right to follow a lode on its dip, he locates or denounces enough ground to protect himself in depth. Hence a large part of his area covers the extension of his mine on the dip, without visible exploitation on the surface. Now comes a decree compelling the owner to have at least one active working in each contiguous 5-*pertinencia* (or 5-hectare) section. For every such sub-division there must be a stope, drift, adit, or other working contributory to the extraction of ore. This requirement is absurd technically, for it ignores the trend of the orebody, the distribution of the better portions of it, and the maintenance of any system of exploitation. It requires a hole to be dug whether ore is found thereby or not; it assumes that the entire area of a mining property covers productive ground; in short, it is blind to all the facts of the case and represents ignorant meddling of a most vicious character. Surely no Mexican mining engineer was consulted in the matter; for mining is an ancient industry in that distressful country, and it is not necessary to go outside to obtain advice in such simple matters of technology. Apparently the welfare of an established industry is to be sacrificed to the creation of opportunities for military requisitions. The decree is that of a dictator on horseback, not that of a national legislature. It is also questionable whether the decree is not unconstitutional by reason of the fact that it substitutes the decision of a Cabinet officer for the deliberate judgment of a duly constituted court of last resort in a matter involving rights of property. In any event, it is a deliberate violation of all the terms under which existing titles have been acquired, and it is retroactive. This may seem a small matter amid the unhappy conditions already obtaining in Mexico, but it is of vital importance to the mining industry, as destroying the confidence of both aliens and natives alike, rendering it hazardous to conduct mining operations of any kind, whether with domestic or foreign capital.

It is reported from Washington that the Government has suggested that the Mexican capital be declared neutral. This is a good idea. At the same time it would be well to place Juarez and Vera Cruz outside the zone of war and neutralize the railways connecting these commercial gateways with the City of Mexico. A precedent is afforded by the treaty ports in China, more particularly the international settlement at Shanghai and the foreign military guards along the railway from Peking to the sea. If next an American garrison were established at these focal points to assist in the maintenance of order, as between the unruly members of the rival factions, we might see some daylight in the darkness south of the Rio Grande. Undoubtedly some such effort to regulate indiscriminate brigandage is necessary. The United States is to Mexico at this time like a respectable householder who has a neighbor on the rampage. The peace of an orderly home is broken by the rough language, the midnight orgies, and the occasional shots across the fence. The disorderly behavior of his neighbor becomes insufferable to the man whose wife and children are exposed to the sights and sounds of a bagnio. If the police will not interfere in checking the revellers, then the householder asks his neighbors to assist him in putting an end to the nuisance. The United States is a country of advanced industrial civilization; it has a neighbor that is in a state of retrograde political disorder; the two are incompatible. No idealism can change the fact; no good nature can prevent the juxtaposition from becoming an intolerable irritation.

The Price of Quicksilver

Quicksilver is one of the metals that has benefited from the conditions created by the war, which has stimulated the consumption of mercury in the manufacture of explosives. Ordinarily the quicksilver industry of this country is a purely domestic one, in that the production and consumption are nearly equal. The price of the metal fluctuates between a level at which foreign metal can be imported and a minimum at which the domestic metal can be sold for export. As the total world's production is about five times the domestic output, this ordinarily would produce fairly stable market conditions, but the price of foreign metal is generally understood to be controlled by the Rothschilds, and this introduces a factor outside the ordinary laws of trade. It is not surprising, therefore, that occasionally the price shows quick and large fluctuations, though the average over a long period is governed by the conditions first stated. The increased buying of mercury by the manufacturers of explosives, both here and abroad, during the past few months has sent the price soaring upward from an average price during last year of $48 per flask to a present figure of about $80. Within the past few weeks there has arisen a good deal of discussion as to what is the real present price of the metal. On March 4 we quoted in our market pages $70 per flask, and on March 11 $80 per flask. On the same dates our junior contemporaries at New York and Chicago quoted figures of $59 and $61 per flask. Evidently someone was misinformed, and we have been called upon, quite properly, to justify the quotations for which we stand sponsor.

Before proceeding further it will be well to adduce more contemporary opinion. The New York *Journal of Commerce* on March 11 stated that quicksilver was in good demand, the price was strong, and moderate sales were being made at $80 per flask. On March 12 the New York *Commercial* said: "An order for 400 flasks of quicksilver was received here from Europe yesterday. Another advance has been named by the leading holder, who is now asking a minimum of $85 per flask of 75 pounds." On the following day the *Journal of Commerce* said that quicksilver was in small supply and the market firm at $85 to $90 per flask. The *Oil Paint & Drug Reporter* of March 15 said: "The steadily increasing export takings at this port [New York] have so reduced domestic supplies as to induce the leading manufacturers and other holders to raise their prices $5 to $10, making their revised quotations $85 to $90 per flask of 75 pounds in 100-flask lots." We were not alone therefore in our statement, that the market-price of quicksilver on March 11 was $80 per flask. Within the past week we had the pleasure of a call from the manager of a mine that is now producing at the rate of over 300 flasks per month; he made to us the statement that he had sold no metal in the past three weeks for less than $80 per flask and had recently refused an offer of $78 per flask for a considerable quantity. We have also asked those sellers who are willing to do so to show us the carbon copies of their bills of sale. While, of course, we can divulge neither names nor exact figures, we are in a position to state from exact knowledge that quicksilver was actually being sold at the figures named in our quotations. One dealer has recently quoted us a price of $67.50 per flask. This is interesting, but does not serve to modify the fact that other dealers have made sales at the higher figures, nor does it establish the market at the lower figure. When several commission dealers are selling potatoes at $4 per barrel a single dealer might quote a price of $3 per barrel, for a variety of reasons best known to himself, but that would not affect the fact that the general market-price was $4 per barrel.

The import of foreign metal is not now possible. Austria, which produced 855 metric tons of quicksilver in 1913, has, of course, been out of the market since the beginning of the War, as quicksilver is contraband of war. The Spanish output, about 1500 metric tons, is chiefly sold through London, and the export of quicksilver from Great Britain was prohibited by the military authorities months ago. The only other considerable source of the metal is Italy, which produced 988 metric tons in 1913. Export of quicksilver from Italy was recently prohibited by the government of that country. Domestic production therefore must meet our own consumption and supply foreign orders that are deflected here from the countries that cannot now export. Evidently domestic producers are justified in the belief that trade conditions entitle them to ask higher prices for their metal.

If the War continues long it seems likely that the price of quicksilver will continue to rise, unless the higher price serves to increase domestic production. This it will do to some extent, but it is questionable if any large increase can be made quickly. The output of quicksilver is not like the production of shingles, in which, to meet an increased demand, it is only necessary to put a larger force of men at work. Quicksilver deposits are characteristically irregular and a large part of the cost of production is the development work necessary to find the ore. No one knows how long the War may last; it is not impossible that hostilities may cease within a few months; producers, therefore, will be loath to spend large sums in development work in the face of the fact that prices may drop sharply before the desired ore-supply is found. This will tend inevitably to restrict increase of production, so that presumably the effect of the rise in price will be only a moderate increase of output. Production in California has been decreasing for the past few years, the United States Geological Survey figures having shown a decrease of 5000 flasks in 1913 and over 4000 in 1914. This decline will probably continue, for the New Idria mine, which produced 6550 flasks of the 11,500 credited to California by the Survey in 1914, is now almost exhausted, according to the report of the general manager for 1914, development work in depth only showing

low-grade ore. The mines in Nevada produced about 1700 flasks in 1914, and offer more possibility of increase under the stimulus of high prices. The only producer of importance outside these states is the Chisos mine, in the Terlingua district, Texas, which yields practically all of the 3000 flasks credited to states not shown separately. This property is now producing more than its normal output, rendering it safe to say that present domestic production is greater than the average for 1914, but less than the average for 1912.

The Waste of Experience

Nothing in human life is so pitiful as the waste of experience. Men come and go, they learn and they unlearn, leaving no record for those that follow. The omission to leave a legacy of information to their successors is due to the failure to appreciate the value of individual contributions to the common stock of knowledge, rather than the unwillingness to be helpful. In the technology of mining and metallurgy, we see a recurrent perpetration of old blunders, the repetition of useless experiments, and the falling of engineers into pitfalls that should have been marked by a red flag long ago. It is the function of the technical press to correct this omission: to invite engineers to record their experiences. A natural human weakness prompts men to make known their successful accomplishments rather than their failures, so that only the brighter half of the story is likely to get into print. Nevertheless the description of a blunder may prove more salutary than the advertisement of a feat. If we were altruistic we should not hesitate to tell our comrades of our mistakes so that they might be saved therefrom. Indeed, it is the mark of bigness in a man when he can stand up and acknowledge an error with the intention of helping his juniors in the profession.

The utilization of experience may be effected in a practical way by persuading the older practitioners, the men of unassailable repute, to record the technical happenings of an earlier day: in a word, to reminisce for the benefit of their sons and their friends' sons. In this issue we begin a series of such reminiscences. The first is by Mr. John B. Farish, a mining engineer who may claim to belong to both the old and the new schools of practice, for he was acknowledged as a leading practitioner fully thirty years ago and is one of those fortunate men who fail to outlive their reputations. His recollections deal mainly with the tampering with samples, or 'salting': a subject of perennial interest, for it combines both the humorous and the pathetic, while illustrating also that phase of business expressed by the old adage *caveat emptor*. We commend our friend's contribution to the younger engineers. It is better to be sure than sorry. Even if the iniquities he describes are not likely to be perpetrated in exactly the same way in these later days, it still remains true that vigilance is the price of safety. Most of us who have served our time in the field recognize that if those who tamper with samples were to take as much pains to effect their nefarious purpose as the engineer does to circumvent them, then 'salting' would be successful more often. In other words, if the trained intelligence of the engineer were available for such malignity, it would be difficult to defeat. We say it with crossed fingers and touching wood, for the idea is forbidding.

The composition of the material used in 'salting' suggests a question that we should like to see answered by some of our readers. In the old days the 'salt' used on gold ores was usually supposed to be gold chloride, while for silver samples the nitrate of silver was commonly employed. However, we hazard the suggestion that gold dust and brittle silver sulphide in the form of powder usually provided the artificial enrichment of samples. In districts where the gold existed in combination with tellurium and in other localities where it was so intimately associated with sulphides as not to be detectable by panning, it was practicable to use tellurides of the precious metals for 'salting.' On the whole, we believe that liquid chemicals were used rarely.

The two examples of deception quoted by Mr. Farish at the close of his reminiscences are peculiarly interesting. This kind of trick has been perpetrated more often than is generally supposed. The most celebrated case was that of the Chrysolite mine at Leadville. We can record one example from our own experience. The mine was in Boulder county; it contained a definite ore-shoot 300 feet long that had been worked for three levels and had been under-cut on the fourth level, leaving an apparent block of ground 300 by 100 feet. A rise from the bottom level had been started in ore. The sampling of the bottom of the third level was satisfactory and compared well with the sampling of the back of the fourth level. In the bottom of the third level there was a 10-ft. hole, which was explained as a sump for collecting the drainage from the stopes, previous to the water being pumped to the shaft. In order to test the block of ore between the levels, the rise was continued. Suddenly it broke into mud and water, which nearly drowned the men at work. Upon investigation it was ascertained that an incline had been extended from the bottom of the little sump on the third level and by means of it the heart of the ore-body had been extracted, without leaving any evidence of the fact along the two levels. If the miners had been drowned, the affair would have been exposed in the courts. As it was, the owners passed the blame to a subordinate, so that legal proceedings would have failed to punish the real culprits. That is the way also in most 'salting' cases: the responsibility cannot be traced except by inference. We quote this last case to supplement those given by Mr. Farish and to draw attention to one of the many pitfalls to be avoided by the younger members of the profession. Wise men may make a mistake, once; a fool, twice. The least that the older engineers can do is to give the benefit of their experience before it passes with them across that range from which the prospector ne'er returns.

Progress in Metallurgy

By JAMES DOUGLAS

*As life advances, one is inclined to look backward instead of forward, and the vista over which my memory carries me has been filled with such a shifting panorama of changes in metallurgy that the whole practice of the art seems to have been re-created.

The first cupola furnace that I saw in operation was at one of the group of mines at Capelton, Quebec, from which the Nichols company still draws some of its sulphur supply. At that time it was operated by a Hartford, Connecticut, company, under a General Adams. When its small brick furnaces made a campaign of a week and smelted 10 tons per day, the feat redounded to the credit of the operator.

The introduction of the water-jacketed cupola dates forward to the next decade. I was using one in Pennsylvania, making copper matte, to the horror of a noted metallurgist, who could not conceive it possible that you could bring fused sulphides into contact with steel without rapid corrosion. In our ignorance we were doing what seemed to be an impossibility, and it is just that recklessness and disregard for precedent which has characterized so much of the work of American metallurgists, and carried us forward at headlong speed.

Once the water-jacket was accepted as the type of the copper-cupola, its almost unlimited expansion in length, but not in width, was a matter of convenience rather than of skill. In Butte the cupolas have been enlarged by adding furnace to furnace.

The first reverberatories which I saw in operation were those in Hill's Black Hawk establishment, where the concentrate from the Gilpin County gold mills was run down into matte for separation in England. Smelting was done with wood as fuel, and the capacity of the furnace was about 10 tons per diem. Shortly after this, Hill formed an alliance with Richard Pearce, who was running what was called the Swansea Works, at the bend of the river approaching Georgetown.

Mr. Pearce had been engaged in the separation of precious metals from copper products in Wales, and applied his skill to the local separation of the Black Hawk matte. Soon the operations were shifted to the larger works at Argo, near Denver, where for many years the Ziervogel method was practised with much success. And to Pearce is due the credit of taking the lead and gradually expanding the size and capacity of the reverberatory, for at Argo and at the company's branch works at Butte this type of furnace grew rapidly in size to 35 by 16 ft., and a capacity of 50 tons.

Big as these were, they were pygmies compared with the huge reverberatories of the present day, heated by oil or coal, smelting as much as 660 tons of charge per day, and fulfilling what the old metallurgist dreamed of as a possibility, but failed always of securing as a reality: the recovery of the waste heat in the form of power.

The fate, however, of the Argo works, despite the science and experience which Pearce brought to bear upon his operations, was virtually sealed when the combined forces of the pneumatic method and electrolytic separation came almost simultaneously to the aid of the metallurgist. The converter brings the matte to metal in a space of time measured by minutes. Electricity at one operation refines the copper and separates the precious metals, simplifying the process and saving time and money. The Argo works had therefore to go out of blast, and the metallurgist retire before the engineer and the electrician.

The changes have not been confined to smelting, but have been conspicuous in the concentrating department. Isolated motors have in great measure abolished the counter-shafts; and grinding-mills of many different makes have competed for acceptance in rapid succession. The National riffle has even displaced the jig in some mills, and now flotation is claiming to supplant all other methods. Whatever invention may for the time being claim supremacy, the experience of the past compels one to admit that the construction of the mill of the future should be so elastic that it can be altered with the least expense and embarrassment to suit the many changes which will become imperative. It will probably consist of a large square structure, within which the devices temporarily employed will be erected upon platforms and scaffolding which can be readily shifted.

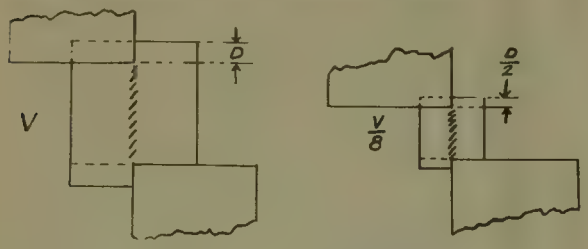
We have been recalling incidents in the history of copper metallurgy, but it is the growth of the iron industry which excites our imagination and wonderment. Its consumption is really the barometer by which we can gauge the world's activity and the demand for other articles; for there is an economic relation in the use of one metal and another. As the demand for iron is the controlling factor, not only in the metallurgical world, but in the industrial world at large, it is iron which fixes the rate of production of virtually all the other metals. I pointed out some years ago that the relation of the consumption of copper to iron in this country was as 1 to 83. That relation has been maintained ever since, and holds good approximately in the world's consumption of iron and copper. That being the case, the demand for the metals, and therefore, to a certain degree, the price which they will command in the market, depends upon economic laws, which will inevitably over-ride our attempts at interference. When these laws come to be better understood and submitted to as implicitly as we bow to the laws governing the forces of nature, the large groups of people who compose the industrial world, instead of engaging in rivalry, which is liable to degenerate into hostility, may possibly co-operate to advance the interests common to all. A world combine would be clumsy to handle, but a world's congress might pass international laws for the regulation of trade which would obviate some of the anomalies that exist today.

*Excerpt from address given recently before the New York section of the American Institute of Mining Engineers.

The Mechanical Efficiency of Crushing

By HERMAN C. KENNEY

Kick's law states that to produce similar alterations in the form of similar bodies requires work in proportion to the volumes of the bodies, according to my understanding of it. In an article by A. O. Gates[1] it is shown in his Fig. 1 how this law applies to cubes under stress. In Fig. 2 he has shown a cube subjected to shearing stress and has shown how the law is inapplicable in this case. It seems to me, however, that the law applies here also. Take the following figure:



100 Mesh Cube
Area one Section = A
Average resistance to shear per square inch = F
Energy = F A D
Energy Proportional to Volume.
200 Mesh Cube

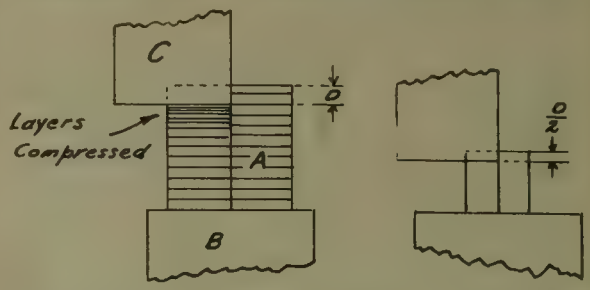
$$\text{Area one Section} = \frac{A}{4}$$

$$\text{Energy} = F \frac{A}{4} \frac{D}{2}$$

(In Mr. Gates' Fig. 2 he assumed that D and D 2 shown above were identical when fracture occurred.)

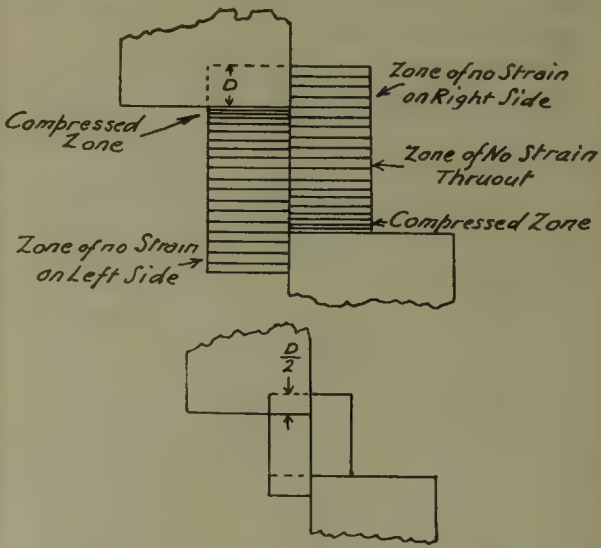
Here analogous changes of configuration have taken place and the work done is proportional to the volumes, as shown and as Kick's law states. This is assuming that the cubes have not been ruptured; that is, that they have not been strained beyond the elastic limit. This, it seems, is all Kick's law implies, as 'configuration' in itself signifies form or shape and not state of division, and the law is essentially a re-statement of the laws of elasticity. Make the assumption that any body is perfectly elastic to a certain degree, however slight, and that up to the elastic limit stress varies as strain. From this point to the yield point, at which the first visible break occurs, the stress is no longer proportional to the strain, and small latent breaks are occurring whose extent cannot be determined.

Now, does Kick's law hold beyond the elastic limit? In Mr. Gates' Fig. 2 it was assumed that the shearing distance would be the same irrespective of the diameter of the cube. That is, if cube V required the force to pass through distance D, cube V 8 would require the force to pass through this distance also, whereas to obey Kick's law D 2 would be required as shown. If the blocks were perfectly inelastic the former would, no doubt, be true, but consider the following case:



The cube A is supported on the anvil B, and C is a distorting force. The left side of A would be compressed, the upper layers more than the lower, and in time these would tend to separate from the upper layers of the right side. In a block of half the diameter the same relative effect would be produced by the force moving through half the distance as before, even though rupture may have taken place. In this case Kick's law seems to be in force even beyond the elastic limit.

Applying this form of reasoning to Mr. Gates' Fig. 2 we have



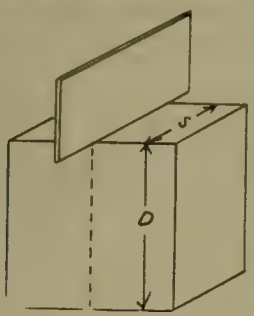
Compression takes place on each side owing to the elasticity of the block, and finally to break it the central portions must have slid past each other far enough to cause rupture, as stated by Mr. Gates in his article.

Obviously, the greater the diameter of the block, the greater would be the distance necessary to produce the same relative effect, and it can be shown that this distance will vary as the diameter of the cube and will not be a constant quantity as stated in the article re-

[1] *The Engineering and Mining Journal*, May 24, 1913, p. 1039.

ferred to. So Kick's law seems to apply here also, and it seems as though it would apply beyond the elastic limit in all cases.

Take the simplest case of all. Suppose a soft chalky material that can be cut with a knife, and that a cube one inch on a side be taken for experiment. Then suppose the cube be cut into two equal parts. If the knife were sharp enough and strong enough, in short, a theoretical knife (since we are dealing in theories), that would sever the molecular bonds without causing compression or distortion, the work done can be expressed easily enough. The distance passed through must equal the diameter of the block, and the force must be the product of the length of the knife-blade in the cut, by the resistance offered to it per linear inch. In other words, the work would vary as the area of the cut.



F = Resistance per inch
Work = F D S

This work would be required if the cube were cracked or broken in the same place by any other means, as it is the net amount of work required to sever the bonds holding the halves of the block together.

Call the unit of work the force necessary to make a cut an inch wide acting through a distance of one inch, and equal to W. To cut a cube one inch on a side into eight equal cubes would require three cuts, or work equal to 3 W. If the original cube already had work expended on it equal to A, the total work in the eight small cubes would be 3 W + A, but since the surface of the original cube was six square inches, equal to fractures of three square inches, A = 3 W, the work in the eight cubes would be 6 W and each would have had work expended on it equal to $\frac{6\,W}{8}$ or ¾ W.

To tabulate:

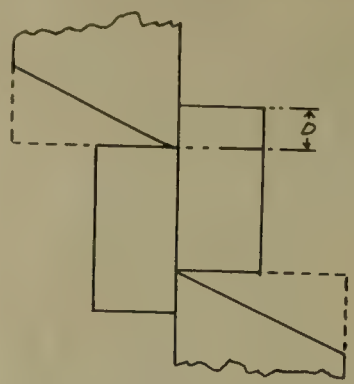
		Unit				
Side of cube, inches.	S	1	1/2	1/4	1/8	1/16
Number of pieces from unit	$P = \frac{1}{(s)^3}$	1	8	64	512	4096
Volume of each piece, cu. inches	$V = \frac{1}{P}$	1	1/8	1/64	1/512	1/4096
Number of unit cuts to reduce from unit cube		0	3	9	21	45
Total work	$\frac{S}{3W}$	*3W	*6W	12W	24W	48W
(For comparison....– 10 log 1/s	†0	3	6	9	12)	

*See above.
†Proposed by C. A. Stadler.

So the series derived agrees with Rittinger's, and not Stadler's series. Rittinger's law states that the work of crushing is proportional to the surface exposed in crushing or to the reciprocal of the diameter crushed to.

There must be a loop-hole some place, and since I have previously shown that the distance the crushing force, or shearing force, passes through must be proportional to the diameter, there can be only two possibilities for the discrepancy in the two cases. Either (1) the force is not proportional to the surface of fracture, as claimed by Mr. Stadler, or (2) the area of application of the force is not equal to the area of the cube-face. Let us go back to Mr. Gates' Fig. 2.

Suppose the jaws of the shear were not square set, as assumed before, but beveled as shears usually are.



The force to cut the block could not have changed if, as given above, it is equal to the area of fracture, but the area of application of this force has changed from a surface to a line, and the work becomes

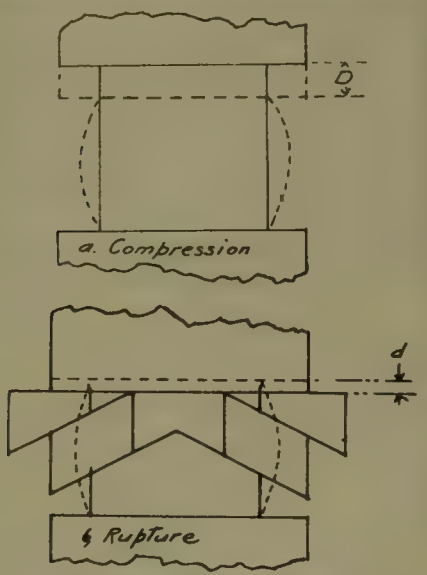
$$W = F\,D\,S \text{ for a one-inch cube}$$

$$\text{and } W = F\,\frac{D}{2}\,\frac{S}{2} \text{ for a cube } \tfrac{1}{2} \text{ in. on a side.}$$

This is not then a volume relation, but a surface relation, since F is constant, D varies as the diameter, and S equals the diameter. So W varies as S^2, as does the surface exposed in this operation. Of course it would be impossible, or nearly so, to shear a cube in this way, and this action might never occur in any commercial crushing operation. Theoretically, however, it is easy and it involves the use of an ideal machine when assuming a 100% efficient one. A steam-engine could never approach 100% thermal efficiency, and this may also be true of crushing devices.

To return to Kick's law. I have shown that it holds in all cases when the elastic limit has not been passed, just as it was intended to, but that in one case, at least, it does not apply thereafter. In my last figure it is evident that for every compression, however slight, there is a corresponding amount of fracture, and that there is added to the work of compression, which is proportional to the volume, the work of fracture in turn proportional to the surface of fracture. As the cut becomes nearly complete, the potential energy of compression changes to work of fracture and the work of compression is lost,

as such, and drops from both sides of the equation. In the case of straight compression, as in a testing machine or stamp, the work done divides into: (1) the work of compression, and (2) the work of fracture. The



PROCESS OF CRUSHING A CUBE.

work of compression will operate up to the yield point and is proportional to the volume, as Kick's law shows. The work of fracture is proportional to the surface of fracture, being simply the work to sever the molecular bonds, as I have shown in the case of cutting the cube where this work acts alone. Now at the yield point the work of compression changes to work of rupture and the parts tend to assume their original shape. To obtain 100% efficiency there should be a complete transfer of work of compression into work of rupture.

Then

$$\text{Work input} = W_c + W_f$$
$$\text{Work recovered} = W_c$$
$$\text{Total work} = W_c + W_f - W_c = W_f$$

But W_c varies as volume and W_f varies as surface exposed. If no further work is put into the rupture W_f must equal W_c, so surface exposed varies as volume.

Here is the agreement between the laws of Kick and Rittinger, showing how the work necessary to break cubes of the same material is at once proportional both to the volumes and the surface exposed by the break.

That the work required to rupture cubes of rock of various sizes is proportional to the volumes of the cubes has been shown by many tests. R. H. Richards in his 'Ore Dressing,' Volume I, page 300, gives the data for tests made at the Watertown arsenal in which it was demonstrated that the force to rupture cubes of the same material was a constant, independent of the size of the cube. From this it is easily shown that the work ($= F A D$) varies as the volume. No measurements of surface exposed were made in this case. Tests made at the same time on similar prisms showed that the work was a volume relation, but that it was not in any way related to the work to rupture a cube.

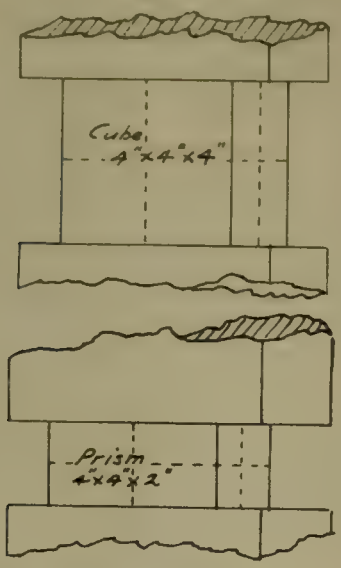
Rittinger's law in no way states that the work to rupture a cube is not proportional to the volume of the cube, neither does the law state that the work done is proportional to the diameter, or the square of the diameter, of the cube ruptured. The law states first of all that the work done is proportional to the surface exposed in the operation and that this surface is, to all intents and purposes, proportional to the reduction in diameter. It is difficult to understand what is implied by the word 'configuration' in the English version of Kick's law, but from the foregoing reasoning it seems that the law holds always within the elastic range and, in cases of straight compression, just up to the breaking point. Rittinger's law does not apply up to the elastic limit, since no surface is exposed. Between the elastic limit and the breaking point small breaks occur, but these cannot be measured; however, if the work is continued so that these breaks are developed they can be measured, so we must consider that the law is in force from the elastic limit on.

Mr. Stadler's version of Kick's law is that it applies always. He assumes that the work of compression in changing to work of fracture is sufficient, and just sufficient, to break the cube into eight similar cubes and that a like amount of work would break these eight into eight more each, yielding in each case surfaces proportional to the square of the diameter of the large cube. It is shown in Kent's handbook that suddenly applied forces are more destructive than slowly applied forces exerting the same amount of work. Kick's law explains this by saying that suddenly applied forces acting similarly will produce alterations in proportion to the volume, just as slowly applied ones do, but that for the same amount of work done the alterations need not be equal for equal cubes. Rittinger's law explains it by saying that when rupture occurs the surface of rupture is proportional to the work done in all cases. A rapidly applied force would require less work to rupture a block, and consequently would produce less surface. This is natural enough, for a sudden blow usually makes a cleaner break than a slow one. Mr. Stadler's theory is at a loss to explain this case, for he has made the assumption that a definite amount of force will divide a block into eight parts, regardless of the way it is applied.

Take the case of a prism. I have mentioned the Watertown Arsenal tests and how Kick's law applied for prisms as well as cubes. Rittinger's law, of course, does not consider the shape of the material, but applies in all cases. Stadler's theory, on the other hand, has nothing to do with prisms. Suppose a prism occurred in a lot of material to be crushed, I believe Mr. Stadler would divide it into eight parts as he does a cube with a unit expenditure of energy. Taking for comparison a prism 4 by 4 by 2 in. and a cube 4 by 4 by 4 in., they can be divided into eighths as shown in the figures on the next page.

According to Mr. Stadler, the force, and not the work, varies as the surface of fracture. In the case of the cube,

the surface exposed is 3 by 4 by 4 in. = 48 square inches. In the case of the prism the surface is 2 by 2 by 4 + 4 by 4 = 32 square inches. So the force to crush the cube would be greater than the force to crush the prism. The Watertown Arsenal tests showed just the opposite, the force to crush the cube being 5962 lb.,



and the force to crush the prism being 8028 pounds.

In case the unit cube does not break up into smaller cubes, Kick's law does not apply further, for the geometrical similarity has disappeared. Cutter (Richards' 'Ore Dressing,' Volume I, page 302) has shown that for blocks of nearly the same volume but slightly irregular in shape, the crushing force is not only not a constant but varied within wide limits, so that the work could not be proportional to the volume of the block. Mr. Richards explains this by the statement that in the cases where the force was greatest, the work done being also great, the blocks were shattered, while in the cases where it was least they were simply split, showing in this way the surface relation.

Referring again to Richards' 'Ore Dressing,' Volume I, page 305-310, tests made by Von Reytt on an ore consisting mainly of quartz, calcite, argentiferous galena, and blende, by crushing in various machines, show that the increase in surface per horse-power varied between 20 and 40 square metres. This was considering, of course, that the machines were 100% efficient. These limits in themselves are very reasonable and are not nearly as wide as the variation between Rittinger's law and Stadler's theory. He adds that in the finer sizes the increase in surface was greater than the law called for. This is very natural under the circumstances, since the ore was heterogeneous and the more easily broken constituents tend to accumulate in the fine.. Then, too, if latent breaks had occurred these would tend to show more in the finer sizes. Mr. Richards sounds a warning note against assuming that all the constituents of an ore have the same specific gravity and tensile strength, citing the case of quartz and galena. He shows that the power to crush a given weight of quartz is to that to crush the same weight of galena as 15 is to 1.

Von Reytt, moreover, adds a table of results showing his energy calculations. This table, although not exactly according to Rittinger's law, is certainly far from being in accord with Stadler's theory. I hope that these observations may serve to show that Rittinger's law is not founded on fiction and should not be dropped as fallacious without direct experimental proof. Further argument without such proof seems to be but beating about the bush.

Continuous Decantation in South Dakota

By JESSE SIMMONS

Increasing popularity of continuous decantation, with counter-current circulation of the cyanide solution, as applied to the treatment of slime, is evidenced by the manner in which it is being solved and adopted by Black Hills operators. Following the example of the New Reliance, the first plant in the district to be equipped for this work, the newly constructed Black Moon mill of the Mogul company was constructed on similar lines. Now comes the Golden Reward, where, after considerable testing, the process is to be applied, and the Moore filter dispensed with. In preparation for the new process there have been installed in this mill a 24 by 16-ft. tank, with Dorr thickeners; a 24 by 16-ft. tank, with Trent equipment; a 12 by 16-ft. tank with Dorr agitator, and a similar sized tank equipped with a pipe agitator made on the premises. Tanks for the slime department as now arranged consist of four 20 by 16-ft., equipped with Dorr thickeners (two of these are steel, recently installed to replace wooden tanks), the two agitators as above, the Trent tank and the large thickener. As the slime at this plant amounts to less than 100 and over 75 tons daily, it is calculated that the equipment will be ample to fill the requirements. To handle the slime between the various tanks, diaphragm pumps are used, and in order to overcome the excessive wear on the driving gear, an objection to the pumps as delivered by the manufacturers, at this mill a new scheme of transferring the energy has been adopted. A frame of ½ by 3-in. angle iron is fastened to a small platform, at one end of which is the pump and at the opposite end, 5 ft. distant, is the drive shaft to which a pulley is attached. An eccentric on this shaft is connected by a rod to a walking beam, which in turn drives the pump. It makes a smooth-running rig, does away with the gears and pinions often used, and appears admirably suited to the purpose.

OPERATIONS of the Broken Hill South during the six weeks ended February 6 were as follows: ore treated, 20,230 tons, assaying 15.4% lead, 7.3 oz. silver, and 14.7% zinc; concentrate produced, 4025 tons, assaying 60.1% lead, 21.6 oz. silver, and 10% zinc. The mine and mill was only at 50% capacity during this period.

Ways That are Dark

By JOHN B. FARISH

From earliest history, deceptions in all kinds of trade and commerce have been practised; mining has not escaped its share. While I stood at the collar of one of the old circular shafts sunk by the Romans in Transylvania during the first century, a shaft that began on nothing, went down on nothing, and ended in nothing, I could easily picture to myself the professional mine-promoter of that day walking up the streets of Rome with his hands full of specimens of the rich gold ores of Transylvania, inducing his friends to invest in the bonanza he was developing in that far-off country.

And so, even if there is nothing new in the following rambling reminiscences, I submit them in the hope that they may serve as beacons to warn the younger engineers of the dangers and temptations they may have to overcome along the road they must travel to win their spurs.

In the early '80s I was engaged to examine a mine in southwestern Nevada, something over 100 miles from Candelaria, the nearest railroad point. I had been cautioned by my employers that while the persons offering the mine were excellent practical miners and judges of mines, they were at the same time not to be trusted, and they might, in order to make assurance doubly sure that their representations would be confirmed, attempt to salt my samples.

With this warning in mind, I took with me to the mine a strong box which I had had made, of sufficient size to hold my sampling outfit. I also took with me several rolls of tape of a peculiar green color, and sealing-wax of a shade which I thought could not be found in such an out-of-the-way place. I was accompanied by two assistants.

On reaching the property, we took the box and entire outfit into the mine, and never for one moment was it out of our sight, night or day, except at the meal-hours, and then the tape was passed around the box and securely sealed with the wax. No one was near us during the time that the samples were being taken, and I, as was always my custom, watched every sample cut, and took part in cutting many of them, and also assisted in the work of breaking down and quartering the samples to convenient size and placing them in the ordinary sample-bags I had taken with me, which in turn were carefully sealed and put inside the box.

After a week of such constant work and vigilance, we finished, and the box was taken with us in the open wagon back over the desert roads to Candelaria. The box was the kind of baggage that the Pullman company refused to allow in a sleeping-car. Consequently, we sat in the last seat of the day-coach with the box next to us. The owners of the mine and the men of whom we were suspicious accompanied us from the mine to the railroad station at Candelaria, and there bade us good-bye. We felt a sense of relief when we had parted from them finally and were at last in the train homeward bound.

In the evening we stopped at a little out-of-the-way station for supper. There were only three or four houses, and as we had our reservations for the sleeper for the night, I determined that we were far enough away from the 'scene of hostilities' to permit me to safely trust the box to the express company and have it sent forward to the assayers. I, therefore, took the box, which was sealed with the same green tape and sealing-wax, into the express-office, and after marking it with my name in care of the assayer at San Francisco, I delivered it to the express messenger. He objected that the rules of the express company did not permit him to accept a box sealed as that was, so we got some screws and fastened the cover down securely with them, removing the tape and wax.

A day or two after I arrived at San Francisco the box showed up at the assayer's, and the samples were duly assayed, but to my surprise they ran about double what I had thought they would from the appearance of the ore as I was breaking the samples. This led me to take a few specimens which I had picked out as being extra good, and which I had carried in my grip, to the assayers. Much to my surprise, these selected samples did not run any higher than did the average samples that were cut. To my mind, this was a suspicious circumstance, and I posted back to the mine and took check samples, which never left me for a moment, as I carried them back with me in my grip to San Francisco. These samples ran about as I judged the ore should from its appearance in the mine, and were too low-grade to pay, economic and physical conditions considered.

It was many months afterward before I learned that of all the people between Candelaria and San Francisco, the only one who was in any way interested in salting my samples was the express messenger at the little out-of-the-way station in Nevada. He probably opened the box after it had been entrusted to him and applied the 'salt' to the samples before expressing it to its destination.

A few years after that I was in Colorado in the interest of George D. Roberts, at that time a well known and prominent mining man of New York, one who, thirty years or more ago, was known all over the West. He had written asking me to find him a large body of ore on which there would be a regular margin of profit. My attention had been called to the Mud Sill mine, not far from Fairplay, in Park county, Colo-

rado. It was owned by certain persons resident in Detroit, and associated with them were two brothers who lived in Colorado. The older brother was the manager for the mine and the younger was his assistant. The older brother was as pleasant, affable, and convincing a man as I had ever met, and it was on his representations that I went to the mine and made what I told him was a preliminary examination. The mine itself was said to be an impregnation of limestone carrying from 18 to 24 oz. of silver. Milling ore of that grade at that time was profitable under the usual mining conditions.

On the day after my arrival at Fairplay I went with the brothers to the mine. After going through it with them, I spent the rest of the day and the following day in taking a number of samples. The formation did not appeal to me, nor did the so-called ore appear to be of commercial value. I did not, however, for one moment think that my samples would be tampered with, though I took the ordinary precaution of putting them in special bags, well sealed with a seal-ring bearing an Old English 'F'; these in turn were put into a canvas sack which was securely sewed, and were delivered by me to the express company at Fairplay. I had, as was my custom, picked out a few specimens of the ore and these I put into my grip under lock and key without the knowledge of anyone.

The older brother accompanied me to the express office, and the samples were addressed to a well known assayer at Denver. The next day, we all went fishing in the South Park river and had a pleasant outing. That night I left for Denver, and my samples showed up on the day after my arrival in that city.

The results of the assays were received in due time and confirmed the statements made to me by the older brother as to the value of the ore. The average, as I now recall, was between 17 and 18 oz. I had one of the specimens I picked out assayed and the result was only 12 oz. I did nothing further with the property; for, as already stated, the formation did not please me, and when the New York mining man came through Denver I told him that it was nothing I cared to present to him and that I had dropped it.

Some little time afterward, the property was taken over by an English company at a price which I understood to be $300,000. An experienced English mining engineer had examined it, and I was informed that on his report the purchase was made. A small mill was erected for testing purposes and to determine what recovery could be effected. It was only run a short time when operations ceased and the entire proposition was abandoned.

Some months had passed when I received a note from the Hon. Charles S. Thomas, the well-known lawyer of Denver, who is now United States Senator from Colorado, asking me to call at his office. I did so, and after the usual greetings he asked me if I had not at one time examined the Mud Sill mine. I told him that I made a preliminary examination. He asked me why I had not gone further and made a second examination and taken the property. I told him that while my samples of the ore averaged up to the grade that had been represented to me, I did not like the formation, and therefore I had advised my client not to proceed with it. He then gave me one of the surprises of my life by asking me if I knew that my samples were 'salted.' I told him I did not; that I had no idea of it, though I had always wondered, in a disinterested kind of way, why the specimen had not run as high as the average of the samples of ore, and that if I had gone back to make a fuller examination that would have been one of the things I should have looked into first. He then said, "Well, your samples were salted," and in answer to my inquiry as to how it was done, he told me this story:

On the evening that I finished sampling and gave the sack of samples to the express messenger—the evening before we went fishing—the younger brother had at midnight gone with the express messenger to the station, where they secured the sack of samples, and carried them some 300 or 400 yards to an old deserted and vacant cabin. They hung blankets over the windows of the cabin and then by the light of a candle they opened the sack. They found, to their surprise, that the sample-bags were sealed with the seal-ring bearing the initial 'F.' In this plight, they carefully opened a small hole in the bottom of each bag and through that administered the 'salt' as a liquid, from some glass instrument. The younger brother told the express messenger that this was only a preliminary examination and that he wanted to get an impression of the seal so that he could be better prepared when I came back to make a fuller examination. So he left the express messenger in the cabin and went up to Fairplay between two and three o'clock in the morning and returned with some wax and plaster of paris. With these he took an impression of the seal on the bags, and having finished this work, replaced the bags of samples in the sack, carefully sewed it up and took it back to the express-office, from which it went forward to Denver by the morning train the next day.

He further stated that the younger brother went to Denver and hunted through the jewelry shops there for a ring with a seal that corresponded with the one I used in sealing the bags. Failing to find one, he sent the impressions to his brother at Chicago, who made a search there, and not finding a seal that would answer the purpose, he had one cut. On the return of the younger brother to Fairplay, he showed the seal to the express messenger and told him he would be ready for me when I came to make the final examination.

I asked the Senator how he knew all this, and he replied that the English company, which had purchased the mine on the report of the English engineer, had brought suit in the Circuit Court of the United States, at Detroit, against the two brothers and their associates, and that the express-agent, who had been promised some of the 'swag,' had told the story of salting the samples

of the different engineers, including my own, because the brother had failed to 'divvy' with him. I watched the trial of the case with interest, and was somewhat disappointed when the verdict was rendered in favor of the defendants. An appeal was taken to the Court of Appeals, where on February 5, 1894, the Circuit Court was reversed and a decision rendered giving the complainants judgment for all they asked. The title of the case is Mudville Mining Company, Limited, *et al. v.* Watrous *et al.* The decision is reported in full in 61st Federal 163, and affords interesting reading.

The third instance occurred at Breckenridge, Colorado. Those engineers who know the veins in that district know that in many of them the ore is contained in an altered and often very clayey porphyry rock occurring in dikes in the general formation. I was one of several who were engaged to examine and make separate reports on one of the prominent mines of that district, famous for its specimens of leaf-gold.

The mine was opened with five levels driven from a central well-equipped shaft. It was stated that the development disclosed an ore-shoot widening from some 300 ft. on the upper level to some 600 ft. on the lower level, and filling the full width of all of the drifts with ore that would assay from $8 to $10 per ton in gold. I began cutting large and systematic samples as carefully as possible, and these samples were broken and quartered in the usual way and assayed by one of my assistants in the assay-office at the mine. We occupied the adjoining room to the assay-office as sleeping quarters and as a convenience for working out our details. No one came near the office during the time of the examination and we felt ourselves quite safe. As I was bred among the gold mines of California, I had learned to use the old Mexican horn-spoon, and so I never examined any free-gold mine without making numerous hornings of the ore. In the different tests of different samples of this ore, I noticed that there was quite a difference in the character of the gold, both in its color and in the density of the particles. It was moderately fine gold, and the samples assayed quite regularly within very limited extremes. So marked was the difference in the appearance of the gold that I saved the hornings until I had accumulated a fair sample. About the time I finished the sampling, with the result that the assays apparently confirmed the statement made as to the length and value of the ore-shoot, some business called me to Denver. I took my samples of hornings with me, and while there visited Professor Van Diest, who was the happy possessor of one of the best microscopes at that time in Denver. Under this instrument, the different qualities of the gold showed up very plainly, and some of it certainly had the appearance of filings or grindings from the old brassy-looking $5 gold-pieces that were coined many many years ago in New Orleans and are now regarded as curiosities.

While on this trip to Denver I determined to inquire into the antecedents of the owner of the property, and with this object I interviewed J. A. Thatcher, at that time president of one of the most important local banks. His answer to my inquiry as to the honesty and integrity of the owner of the mine was one that I shall never forget. He said: "Well, I have known him since 1860 and he is an honest and honorable man, but he made a fortune in Leadville and so has had a taste of the luxury of wealth; and now he has lost about all of his money. Under those circumstances, you cannot tell what an honest man might do."

Upon my return to the mine I took with me two trusted miners who had only reached Colorado within two or three days and who had no personal acquaintances anywhere in the state. With them I began a check sampling of the mine. I took thorough possession of it, much to the annoyance of the manager, and for three days kept everyone out of the property. During these three days we cut back into the walls of the drifts at different points, from one to two feet. In other places, we put in shots that extended into the walls as far as the cuts. The samples taken from the back end of these cuts and from the bottoms of the shots returned only $2 to $3 in gold, and in all cases this gold was uniform in its appearance and character. This satisfied me that something was wrong, and I notified the head assistant of one of the other engineers who was examining the property, a well-known professor in one of the schools of mines, that I had become suspicious of salting and I would advise him to resample the property. Word came back from the professor that every care had been taken and he was personally satisfied with the sampling he had already made. To test the matter further, I determined upon a mill-run upon the property—there being a mill on it—though we all know how easy it is to salt a mill-run even where extreme care is used.

As the ore was broken in the mine we sampled each place as it was blasted, sampled the ore as it was hoisted in the buckets, sampled it as it went through the crusher and from the self-feeders into the batteries, and sampled the tailing. With all of this sampling, there was little chance for deception and the mill-run showed that the gold contents of the ore were very much lower than had been represented and much too low to pay. We paid no attention to the bullion.

Years afterward, a report reached me that when the manager of the property was on his death-bed, he told how the salting was done and that it cost several thousand dollars. Personally, I have been puzzled to know and can imagine no other way than the use of a shot-gun. Even with this, the particles were so small and so light that it would seem a difficult operation, especially to distribute the gold as evenly as it was. On the other hand, it must not be forgotten that the ore itself was of clayey character and that the gold would readily attach itself to it.

But 'salting' is not the only means of deception in mining. An interesting case came under my observation in the examination of a property many years ago

in Clear Creek county, Colorado. A two-compartment incline shaft, one compartment for hoisting and the other with a ladder-way, had been sunk on the vein to a depth of something over 400 ft. Four levels had been run at approximate depths of 100 ft. below each other. A definite ore-shoot had been practically worked-out from the third level to the surface, but good ore showed in the bottom of the third level under the stopes and along the roof of the fourth level. My samples were taken carefully in the floor of the third level and along the roof of the fourth to determine the tonnage and value of the ore blocked-out between the third and fourth levels.

While engaged in this sampling I was delayed one noon until after the engineer had gone to his lunch, and so had to climb out of the mine on the ladders. A few feet, perhaps twenty, above the roof of the fourth level I noticed that some of the lagging on the end of the shaft had fallen back at the top but was caught at the bottom. I did not think much of it at the time, but later determined to see why this lagging should hang in such a peculiar way. On making an examination, my candle disclosed the fact that back of the lagging a small drift had been driven into the block of ground that was supposed to be standing intact. Tearing the lagging away, I went into the drift and found that in a short distance it opened into a stope large enough to demonstrate that the heart of the block of ore that was supposed to be in reserve had been extracted. The ore had probably been wheeled out to the shaft through the little drift that I had accidentally discovered.

Quite a number of years ago, Alfred Wartenweiler and Henry Bratnober, two of the best known engineers of their day in the United States, had an option on a large property near Red Cliff in Colorado. The option was not exercised. Long afterward when talking the matter over with Wartenweiler, he told me that the principal ore reserves appeared to be in one large block that had been exposed by drifts on four sides. During the sampling he found that one of the shift-bosses was an old miner who had worked for him a number of years when he was manager of the famous Lexington mine at Butte; that one day he met the miner in a drift, and the miner whispered to him not to finish the examination of the mine without taking out a certain lot of cribbing at one corner of the block of ground. This Wartenweiler said he did and found to his astonishment that the heart of the block of ground had been taken out. At that time, a firm doing a very big packing business in a large city on the Atlantic coast was interested in the property, but whether the members of the firm knew of the attempted deception, my informant did not know.

A number of other instances of attempted deception that have come under my personal observation could be mentioned, but I think these are sufficient to show that in mine-examination work good-fellowship with the miners is apt to be useful and that, above all else, "eternal vigilance is the price of safety."

Smoke Dilution at Midvale

By L. S. AUSTIN

The bag-house at this lead-smelting plant of the United States Smelting, Refining & Mining Co., at Midvale, Utah, is divided into two parts, which receive respectively the gases from the blast-furnaces and from the roasting-sintering machines. The former gases contain less than 0.1% of sulphur dioxide, and hence may be freely emitted into the atmosphere without possible detriment to vegetation. The gases from the roasting division, however, must, by order of the Court, be kept below the limit of 0.75% in sulphur dioxide, it being then considered sufficiently diluted to permit escape without detriment to life, either vegetal or animal, in the surrounding country. Also, by order of the Court, the limit of 10% sulphur was not to be exceeded for the ores treated at these works.

Of late, however, the proportion of sulphide ore has been increasing, so that at present 80% of the ore on the blast-furnace charge is composed of sintered (that is, roasted) sulphides. To remove all possible chance of complaint on the part of the neighboring farmers, the Company brings the percentage of sulphur dioxide in the escaping gases from the sulphide division safely below the permissible limit by admixture with air.

From near the roof and at the end of the bag-house a down-take comes off, 11 by 11 ft. in sectional area. This branches near the ground, each branch entering a No. 20 Sorocco suction-fan. These fans are narrower than the regular No. 20 Sorocco fan in order to insure greater efficiency. Estimating the temperature of the bag-house gases at 135°F. and the maximum air-temperature at 100°, both fans will discharge 350,000 cu. ft. per minute. The diameter of the fan is 10 ft. and it will run at 100 r.p.m. Both fans require 70 hp. against a resistance of 0.54 in. of water. The two fans are on a common shaft and are driven by a 150-hp. electric motor. In the down-take are regulated openings into which air is drawn, and a further supply can also be obtained by opening the lower doors of the upper chamber of the bag-house. In this way any desired dilution with fresh air can be obtained to keep the sulphur dioxide below the proposed limit. The stack is 16 ft. diam. and the diluted gas mixture escapes through it at the rate of one-third of a mile per minute.

It will be seen that, owing to the entrance of fresh air before the fans, and to the action of the fan-blades, there is a thorough mixing of the air with the filtered gases. When in addition, we remember the high velocity with which the mixture is shot upward, its superiority over the older way of discharge is evident.

It certainly appears that any chance of damage to the farmer is now eliminated and that complaints and damage suits initiated by him should cease. The Murray plant of the American Smelting & Refining Co. is putting in a similar installation, except that the fresh air is supplied in known quantity by a separate fan.

Infusorial Earth

By SAMUEL H. DOLBEAR

Introductory.—Infusorial earth, called also kieselguhr, diatomaceous earth and known by various trade names, is generally described as a variety of opal. Chemically, this designation is correct, but physically it possesses characteristics about as different from opal, in the sense in which the word is generally taken, as can be imagined. The classification is a most unsatisfactory one, and there is really no more justification for referring to infusorial earth as a variety of opal than there is for calling diamond a variety of coal. As there has been much confusion and a good deal of difference of opinion as to the correct designation for this material, a few words on this subject seem timely.

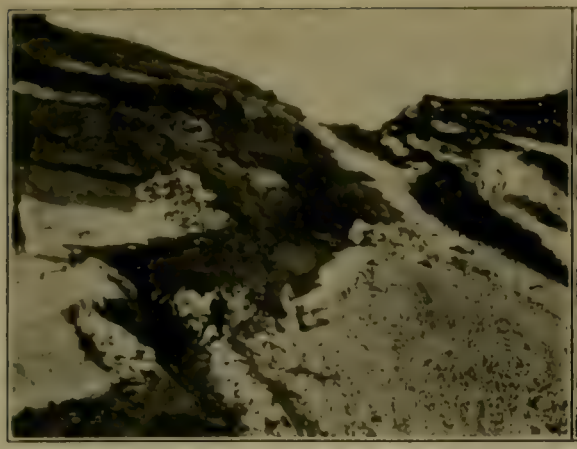
Diatomaceous earth is essentially the silicious remnants of diatoms, an aquatic form of plant life. Infusorial earth, then, would be similarly derived from infusoria, a low order of animal life. Most deposits of this material, if not all of them, are made up of both diatomaceous and infusorial earth, and either name may be applied with equal justification, unless one is willing to go to the pains of determining in each sample which of the two is in the majority. If more diatoms be found than infusoria, then diatomaceous earth would properly describe it. The name 'kieselguhr' is of German origin, being a combination of the German *kiesel*, meaning flint, and *guhr*, an earthy deposit or sediment in water. Tripoli takes its name from Tripoli in Africa, where large quantities of the earth are quarried. While in this country it is used to some extent interchangeably with diatomaceous and infusorial earth, it is commonly employed to designate a light porous variety of chert mined in Missouri and other places. This chert is supposed to have originally contained much lime which has been dissolved out, leaving a cellular structure chiefly consisting of silica. The uses of tripoli are very much the same as those of kieselguhr, although the latter is finding a wider variety of applications, owing to its lighter weight. It is a soft, chalk-like substance, extremely light, and when pure, almost white. Diatoms are so small that 40,000,000 may be easily placed in the space of a cubic inch.

Few substances are more widely distributed than this. It is found in nearly every country on earth, and in North America its occurrence is noted from Alaska to the Panama Canal. It is by far most abundant in the eastern portion of the United States, where in Delaware, Maryland, Virginia, and North Carolina it has been deposited over thousands of square miles and subsequently covered by alluvium of variable depth. Considerable amounts are mined in Maine and Nova Scotia. Much of this is shipped to England, in which country none is produced. Small quantities of high-grade material are found in Scotland. Very good earth, close to tidewater, is found in Alaska. Large shipments have been made from the gulf ports of Mexico to New York, this earth being white and resembling that mined in Africa. Algiers and Tripoli are the sources of the cheapest infusorial earth reaching the markets of the eastern United States. In spite of the fact that long overland hauls are necessary, the cost of production is very low. The product weighs 35 to 60 lb. per cubic foot, and requires careful sorting upon arrival at American ports. Upon distribution into three grades—light, medium, and heavy—it is then put into the market, selling at an average price of about $9 per long ton. This price prevails for lots of 200 tons or more.

The deposits of Germany are one of the most important factors in this industry, and the owners, who also control the African sources, dominate much of the world's trade. Owing to the boggy nature of some of the ground, hydraulic dredges are used in many instances. The earth is classified by flotation, dried, calcined, and ground. The exact method of treatment is held secret, and competitors have been unable to duplicate these products. This accounts for the demand for the German earth at relatively high prices. Outside of the United States, Germany is one of the principal producers of infusorial earth. English manufacturers, however, have heretofore purchased infusorial earth from Germany, and as the channels of trade are closed in that direction, they are now looking to American producers for a supply.

There are many deposits of this earth on the Pacific coast. Its occurrence is by no means limited to the Coast range, for it is found far inland in Nevada, Utah, Arizona, and New Mexico. Among the states which have produced this commodity are California, Missouri, Illinois, New York, Maryland, Virginia, New Hampshire, Massachusetts, Connecticut, and Nevada. In the Government reports, it is customary to give statistics combining the output of infusorial earth and tripoli, designating both as abrasives. While these two products resemble one another in some respects, and their industrial uses are much the same, there seems to be abundance of reason for keeping separate records of each. Through the practice mentioned, much confusion has resulted, and I find a constant tendency to confound the two by purchasers, many of whom have regarded tripoli simply as another name for infusorial earth. The structure, origin, and some of the physical properties are quite different. Its classification as an abrasive is correct, of course, but there are now many other uses for this material; in fact, its application as an abrasive is perhaps not as important now as its use as an absorbent and filler.

So many deposits of infusorial earth have come to my attention in the past few years, some good and some bad, that I have come to wonder if one of its principal uses was not to afford a pastime for mining promoters. This is accounted for, of course, by the increased demand,



THE QUARRIES ARE WORKED IN LAYERS 12 FT. DEEP.

QUARRY WORK AT LOMPOC.

new uses that have been discovered, and the fact that it occurs abundantly in California. In order to compete with producers who are now operating, it is absolutely essential that the deposits be large, of easy access to rail, and capable of yielding the best quality of earth. There are a number of factors to be taken into consideration in determining whether or not the earth is of a character to be valuable. Density is one of these. I believe in all deposits the density will be found to vary considerably. Where extreme lightness is required, the material is selected, the denser portion being kept separate and used for other purposes.

The lightest earth found in the Lompoc deposits, when air-dried for a month or six weeks, will not exceed 30 lb. per cubic foot. As the earth is capable of absorbing water in an amount equal to as high as 200% of its original weight, no judgment of its real weight should be passed until the sample is first dried. For most purposes color is a determining factor, a white or nearly white product being preferred. The sample should always be dried before determining the color. When taken from the ground the material invariably contains a good deal of uncombined water which may impart a gray, brown, or yellowish color. Much of this disappears as the moisture evaporates. According to Percy A. Boeck, the Lompoc earth contains 25 to 45% free moisture as well as 5 to 10% combined water.

Uses.—Those to which the earth is put are so numerous and varied that it is not possible to classify them completely. The two principal applications are dependent upon its abrasive qualities and its ability to absorb moisture readily. Almost equally important is its non-conduction of heat, which has resulted in extending its use to insulating of boilers, steam-pipes, safes, and refrigerating-plants. It is used quite extensively in metal-polishes, scouring-soaps, and in the preparation of some tooth-powders.

The chemical composition of the earth is not important in many of its applications. On the other hand, where the material is to be subjected to any high degree of heat, the presence of too much lime or magnesia will tend to reduce its point of fusion. In the following table I give analyses of infusorial earth from various places.

	I.	II.	III.	IV.	V.	VI.
	Per cent					
Silica	88.78	77.78	80.53	84.15	91.43	81.53
Alumina	2.68	2.96	5.89	1.40	2.89	3.43
Iron oxide	trace	0.00	1.03	0.70	0.66	3.34
Titanium oxide	0.10	....	.....	....	....	....
Lime	1.61	0.88	0.35	1.75	0.36	2.61
Magnesia	1.30	0.37	....	1.10	0.25	....
Soda	...	....	....	....	0.95	1.43
Potash	...	....	....	....		1.16
Loss on ignition	5.54	17.03	12.03	10.40	3.80	6.04

Localities: I, Lompoc, California; II, Sonoma county, California; III, New Hampshire; IV, Germany; V, Nevada; VI, Maryland.

As an absorptive, it is used to some extent in the manufacture of dynamite, and in Europe it has been used as a carrier of liquids. This is done for convenience in shipping bromine and other liquid chemicals, the earth being allowed to take up as much fluid as it will, and is then packed in wooden containers. In the same way it may be utilized as an absorptive of liquid manures. The sugar refineries in California alone use several hundred tons per year for filtering syrups.

Among its miscellaneous applications are the manufacture of papier-maché, Swedish matches, sealing-wax, sodium silicate, ultramarine and other pigments, analine and alizarine colors, gutta-percha products, artificial stone, composition flooring, ceramic products in glazing; as a filler in paints, as whiting, in plaster wallboards for lightening their weight and increasing their fire-proofing qualities, in electric stoves and fireless cookers; in the manufacture of phonographic records, in preserving timbers, and in portland cement, the addition of infusorial earth having been found to increase the resistance of the concrete to salt water. It is sometimes dusted over freshly laid asphalt surfaces to prevent adhesion. Introduced between the floors and partitions of buildings, it acts as a sound deadener. Experiments have recently been made in San Francisco in the manufacture of crayons from this substance. A

binder is added and the mass subjected to pressure in molds. Sawed into blocks, infusorial earth is made up into filter-stones, and the use of sawed blocks as building stone has been suggested. Refractory fire-brick having a fusion point of 1610 C. (2930 F.) is also manufactured.

California Deposits.—This state has become the leading producer of infusorial earth through the operations of the Kieselguhr Company of America at Lompoc in Santa Barbara county. These deposits have been worked for over fourteen years, increasing rapidly during recent years. According to the figures of the California State Mining Bureau, 6895 tons was mined here in 1913. The same authority gives a total production in California since 1889, of 38,442 tons, most of which came from the Lompoc quarries. The increase in demand for this material has been largely due to the intensive advertising and instructive campaign conducted by the Kieselguhr company. The engineers of this Company devote much of their time to instructing manufacturers in the application of the Lompoc product, and through this service and the fact that it owns forty or more patents covering as many uses, it is able largely to control the market. This has required a heavy investment, and aside from the extensive equipment at the quarry, the technical investigations and educational work alone have cost over $100,000. Here we have an example of high technical and business efficiency; manufacturers of other mineral or chemical products could well afford to study this Company as a model for their own organization to follow in building up a demand for the products they have to market.

From the point of transportation, the Kieselguhr company's mines are well situated. It has direct connection with the Southern Pacific company's railroad, and it is easily feasible to load directly into ships, tidewater being about four miles distant. Shipments by water have never been made from here, but the Company is now considering construction that will enable it to ship by water both to local markets as well as to the Atlantic seaboard and Europe. The Lompoc deposit is described by A. H. Krieger, general manager for the Company, as being several square miles in extent and having an average thickness, without any overburden, of 960 ft. The accompanying illustrations will convey to the reader something of the extent of the deposit.

The earth is extremely light, averaging 28 lb. per cubic foot or a little more than half the weight of the same volume of water. This is the lightest earth found, and as its usefulness is dependent in a large measure on its volume or bulkiness, it follows that this light product is more valuable than that weighing 35, 40, or 50 lb., as in the case of similar earth elsewhere.

The old methods of quarrying the earth have recently been abandoned and new equipment provided by which long narrow strips are sliced in the quarry face. These strips are 3 ft. wide, 500 or 600 ft. long, and 40 or 50 ft. deep. As soon as they are loosened, they are split into large flat blocks, and hauled to the sawmill. The function of the sawmill is to produce various shapes, the largest part of the output being bricks. This portion of the equipment has been completed quite recently, and is operated electrically. Power is transmitted over a recently built line, 26 miles in length. Where the earth is to be shipped in bulk or ground, it is accumulated in long winrows and allowed to dry by exposure to wind and sun for about six weeks.

The earth found at Lompoc is classified by the Kieselguhr company into three grades, the following being characteristic analyses of each:

	(1)	(2)	(3)
		Per cent	
Silica (SiO_2)	88.78	85.28	94.59

Sample (1) Very light-weight pure white kieselguhr.
(2) Light-weight brownish kieselguhr.
(3) Compact diatomaceous shale.

The crushing and grinding equipment, provided with air separators, is designed to prepare the various grades demanded by the trade. The ground product is packed in bags. Motor trucks are used to convey the material along the mountain roads, twelve miles of such roads being maintained by the Company on its own property connecting quarry workings with the various mills.

The deposits of J. C. Jens are seven miles from Bradley, in Monterey county, and from a point of reported production, are next in importance to those of Lompoc. According to Mr. Jens, 1700 tons was shipped in 1913, and about 1100 tons in 1914. Most of the material shipped was used for insulating purposes. Work is carried on during the summer months only; only enough earth is mined to fill contracts for lots of several carloads or more. The deposit covers 120 acres, and test-holes show a thickness of 240 ft. The earth is broken by the use of plows and scrapers, and only crude earth is sold, there being no grinding or sawing machinery on the ground.

The following analysis is given as characteristic:

	Per cent.
SiO_2	84.00
Al_2O_3	5.00
Fe_2O_3	0.00
H_2O	11.00
	100.00

The Los Banos deposit is 12 miles southeast of Los Banos, a town on the Southern Pacific railroad in Merced county. There are no heavy grades between the mine and railroad, but, as is the case of many California roads, no hauling can be done during the rainy season. The owner, George B. McDevitt, states that analyses show an average of 90% silica and an aggregate of 2.5% alumina, iron oxide, lime, and magnesia.

What is probably one of the largest deposits of this earth in California is found along the banks of the Pitt river, in Shasta county, California. It is reported to be 16 miles long and several hundred feet thick. Unfortunately, it is too inaccessible and too far from rail to be commercially important. In the Owens River valley, Inyo county, California, a little has been mined by John Black in the vicinity of Aberdeen, six miles from the Owenyo narrow-gage railroad. A shaft sunk on this claim shows the earth for a depth of 40 ft. It can be followed for many miles along the foothills of the eastern slope of the Sierra Nevada in Inyo county. In Los Angeles county there are a number of beds of diatomaceous earth, and attempts are now being made to explore these. In Sonoma county, two carloads were mined and shipped in 1913 from a point about five miles from Mark West station. The deposits are small and the earth is somewhat discolored. In Nevada, a few carloads are occasionally shipped from points along the Tonopah Goldfield railroad, and some has been produced from deposits 12 or 15 miles from Miller. The wide distribution of infusorial earth is fairly indicated by the fact that deposits have been noted in 16 counties of California.

MINERALS EXPORTED from Broken Hill in January were only worth $720,000, against about three times that amount in normal times.

Cost of Mining and Milling at Tonopah

By JAY A. CARPENTER

*At some future time when the United States Bureau of Corporations requires a fixed form of detailed report from all metal-mining companies, and such reports are given by the companies to their stockholders, such a compact statement as given in this article will be accurate in detail and easily secured. At present, to illustrate the contrast, the Tonopah Extension divides all operating expenses under the four headings, 'mining,' 'milling,' 'general expenses,' and 'administration expenses,' while the Montana-Tonopah divides its disbursements into 48 items, and a table on the cost of operations has eight headings, as follows: 'mining,' 'development,' 'milling,' 'general expense,' 'maintenance,' 'marketing,' 'indirect costs,' and 'depreciation.' In most of the reports the total costs of operations per ton of ore include only the Tonopah office vouchers, and to get the total cost per ton the financial statements must be studied to find the head or Eastern office expenses; but this is not the case with the Montana or Nevada Hills companies, with head offices at the mines. This contrast exists through all the reports. In one report the total information given concerning mill costs is in the one item 'milling'; in a second, the annual cost of 61 items under the head of 'milling' is given; and in others, complete milling costs for every month of the year are to be found.

After a careful study of these many different reports, table No. 2 is a conscientious attempt to take all these varying methods of cost-accounting and group them under a few definite heads for a direct and fair comparison of cost data for the year 1913.

It will be noted that the Nevada Wonder and Nevada Hills companies are also included, since these companies treat ores similar to the Tonopah ores and the wagon haul per ton to these properties from Fallon is no greater than the Hazen-to-Tonopah railroad freight rates.

*From *The Tonopah Miner*, March 27, 1915.

In table No. 1 is given a description of the reduction plants of the mining companies at the time the cost figures in table No. 2 were obtained. The data for table No. 1 were taken from articles in the technical press and from my personal knowledge of these plants. The tables are given on the next page.

The following general observations on table No. 2 bring out points of special interest. The grade of ore milled varies from $8.41 to $21.09, the daily tonnage produced from 52 to 473 tons, yet the gross cost per ton of those mines having reduction-plants varies only from $7.42 to $8.93.

The gross extraction varies within the limits of 87.2% and 94.45%, while the net extraction, which is the important extraction figure since marketing costs are not included in the total working costs and must be deducted from the gross extraction, varies from 84 to 91.95%. The variation in the cost of marketing depends upon whether bullion is the only product made, in which case about 1.6% is the cost of marketing, while if any concentrate is shipped out, with its heavy freight and smelter charges, the cost of marketing goes up in proportion to the tonnage shipped.

The book charge of depreciation, varying from nothing to $4.65 per ton, illustrates the varying importance attached to this charge by the different companies. The tons of ore for one foot of development work is an indication of the progress made in blocking out ore reserves, or the search for some to block out, and has a direct effect upon the total cost of mining.

If the "total of all costs" be divided into the two heads 'mining' and 'milling', and the important factor of net extraction be considered, a summary of table No. 2 would be as follows:

No.:	1.	2.	3.	4.	5.	6.	7.	8.	9.	10.
Mining	4.68	3.58	5.87	4.19	4.46	0.00	4.20	4.62	4.35	5.57
Milling	2.92	3.84	3.06	3.26	3.59	3.94	3.24	3.53	3.32	7.27
Net ext., %	92.0	85.8	86.8	88.6	87.5	84.4	84.0	91.9	91.1	90.0

TABLE NO. 1. REDUCTION PLANTS OF THE MINING COMPANIES

(10) Jim Butler	18,900	$19.80	1,575	52			5 20	37	5.57	6 23	*1 04	7.27			00	12.84	.08	12.92			90 00	?

(1†) Checks total on page 7 of the annual report, minus depreciation and marketing costs, and "total direct mining" of page 26

(1‡) Checks from page 20 includes U S corporation tax

(1§) Includes from page 7 " marketing bullion," "marketing concentrates and slag," and "smelting losses in concentrates"

(2) All figures except those marked (†) taken from "costs per ton" table page 12

(2†) The figure $7.44 is derived from page 19 by adding all disbursements for the year except that of $12,549 for patent litigation, $75,007 for exploration, and those for capital investments. The difference between this $7 44 and the $6 33 shown on page 19, is here shown as eastern office expense However in the "income and surplus account," page 20, the total expense per ton of ore figures $7 50, thus including the patent litigation but not exploration, and is divided into mining, shaft sinking and general expenses, $3 68, milling costs and general expenses $3 08, and freight $0 74 This throws all eastern office expense directly into mining and milling

(2*) Freight.

(3) All figures taken from cost per ton and "profit and loss account" statements The figure $8 93 does not include construction account which totaled 29 2 ct a ton.

(4) All figures taken from mining and milling operation tables. The item "marketing costs" shown in the table as a percentage figure is in most all of the reports shown as a money item in the cost per ton statement but does not show as an expense in cash receipts and disbursements because the freight, express and treatment is all deducted by the smelting and refining companies before remitting to the companies

(5) Figures taken from cost of operation table in which the items "general expenses," "maintenance," and "indirect costs" are divided equally between mining and milling as the total indirect charges. This leaves nothing for eastern or main office as this is at the mine in Tonopah.

(6) Operated as a custom plant on Jim Butler, Tonopah Merger and other ores and on sweepings and tailings

(7) As in the case of the Montana-Tonopah all expenditures outside those given for direct mining and milling are divided equally between mining and milling as indirect charges. Current construction of 2 1 ct. is not included.

(8†) Includes item "Ore on Dump at Cost of Mining" from "assets" table as 3,517 tons dump ore was milled.

(8‡) From mill supt. report.

(8§) The figure $8 15 is from cash receipts and disbursements table, page 25. The difference of 58 ct. thus falls to main office expense. It probably contains considerable mine construction expense, but this item does not show anywhere in the report. It is not in plant and betterments for that asset shows a decrease for the year greater than the depreciation charged off.

(9†) All indirect expenses, including San Francisco office, are given as one item which is divided into mining and milling

(9‡) This total does not include interest payments on loans.

(10) This company has no railroad spur or reduction plant of its own, but sends it ore to the Belmont's Millers plant.

(10*) Transportation

DISCUSSION

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Milling Gold Ores in Cyanide

The Editor:

Sir—Permit me to correct a slip which I notice I have made in my letter on the above subject in your February 20 issue. "On the Rand, where milling in cyanide is usual * * *" should, of course, read: "On the Rand, where milling in water is usual * * *"

London, March 8. A. W. ALLEN.

Valuation of Dredging Ground

The Editor:

Sir—The equilateral triangle arrangement of holes that forms the subject of E. J. Vallentine's communication in your issue of February 6 has already been mentioned by C. S. Herzig during this discussion. Its advantages are so obvious that it is a wonder any other system is ever used. To mention one, the amount of bush-cutting is only about 75% of that required for the square arrangement, assuming the holes to be developed on parallel lines in each case. Some years ago I pointed out in the *India Rubber Journal* how the entire cost of bringing an estate into bearing could be covered by adopting this method of setting the trees, as against the customary square system. To arrange the triangles it is only necessary to run parallel lines at a distance apart equal to the sine of 60° multiplied by the distance apart of the holes along each line, the holes in alternate rows 'breaking joint,' that is, falling opposite the central point of the line between two holes on an adjoining line. Two lines 194.2 ft. apart laterally, with the holes spaced 224.3 ft. apart along the lines, would give a series of equilateral triangles each half an acre in extent, the acreage varying as the square of the distance between the holes. It may be pointed out, however, that this means only one hole per acre, each hole standing at the centre of a hexagon of that size. If no ground can be considered developed unless it lies within the equilateral triangle formed by three holes, the amount of ground actually developed per hole will depend on the shape and extent of the property. Thus 3 holes may develop half an acre, 7 holes three acres, and 19 holes twelve acres, and so on to the limit case of one hole per acre covering the whole earth.

The causes and effects of the ambiguous results of sampling on the square system do not appear to have been very clearly stated by any of your contributors. If a square is sampled by a hole at each corner and calculated by dividing it into two right-angled triangles, the value of the square will differ ('value' is used in its material sense) according to which diagonal is used in dividing the square, except in the case where the sums of diagonally opposite values are equal. If the value is calculated by treating the square as such, that is, averaging the four holes, the result is the mean of the two possible results obtained by dividing into triangles. Given a sufficient number of holes, from the law of averages the final result would tend to be the same, whether the diagonals were drawn consistently on one bearing or the other, or drawn haphazard but without prejudice, and this result would be the same as obtained by calculating in squares. If the initial assumption is that ground can be sampled by dividing it into squares with a hole at each corner, the obvious proceeding is then to compute it by squares, and disregard any holes that do not define a square, and any areas that are not square, and therefore do not conform to the initial assumption. However, as those rejected holes define triangles in such a way as to exclude bias, the values of the remaining triangular areas can be computed with practically the same degree of accuracy if the work is extensive and the marginal values fairly uniform. In this way I obtain 39 as the average within the lines of the figure that has so often appeared in your columns, as against Mr. Hohl's figures of 35.8 and 37, and Mr. Herzig's 34.96, but I hope it will be understood that this is merely a note, submitted with diffidence.

R. T. HANCOCK.

Jemaa, Northern Nigeria, March 13.

The Editor:

Sir—The system of boring advocated by E. J. Vallentine in your issue of February 13 has already the sanction of first-class practice. W. A. Prichard, in his report upon the properties of the Pato and Nechi mines (Colombia), refers to his adoption of a series of polygons formed by joining the points of intersection of interlacing circles. The balanced effect produced, as pointed out by Mr. Vallentine, is an ideal condition for the calculation of the value of units and the subsequent summation of results.

But this balance is a matter of care, time, and money, and its absence is not covered but rather confounded by calculations based upon ideal principles that have not been respected. A small company will not pay for first-class work and cannot expect first-class results; but it is an open question whether an engineer who is re-

stricted in his examination may not obtain better results by abandoning the idea of valuation by individual units.

Surely a series of well-tested sections running across a property at convenient intervals will give a fairer estimate of both value and depth than an ill-considered geometrical arrangement (probably adopted to economize boring operations) in which the holes are not representative of the units employed in subsequent calculations. If one standard of computation be adopted, it should, I submit, be based upon one standard of boring, namely, the system producing the greatest balance, which is undoubtedly that demonstrated by Mr. Vallentine.

London, March 17. EDMUND BONELLA.

Precision of Thought

The Editor:

Sir—Under this caption, in your issue of March 20, the use of the singular or plural form of the verb in the sentence, "Of the tonnage hoisted, 626,000 tons *was* crushed," is interestingly discussed.

I do not have the original article before me, but from the expression referred to, standing alone, it would appear that the intention of the writer was to make a clear separation of the tonnage crushed from the tonnage hoisted, and, to do so, he was obliged to subdivide the tonnage crushed into 626,000 separate tons, the common weight units. Thus separated from the tonnage hoisted, these 626,000 tons *were* crushed. By way of further explanation, the sense, in my opinion, that was sought to be conveyed might be expressed as follows: "Of the tonnage hoisted (1,000,000 tons), 626,000 *were* crushed, or $\frac{626}{1000}$ of the tonnage hoisted *were* crushed."

BERNARD MACDONALD.

Los Angeles, March 26, 1915.

[We have evidently failed to make clear the vital point that the ore was not at any time divided into separate tons; the quantity was not subdivided, but the writer was endeavoring to distinguish between a total quantity that was hoisted and a part of the whole that was crushed.—EDITOR.]

The Editor:

Sir—Your articles on 'Precision of Thought' and the letters they bring forth are always interesting, and Mr. Shockley's letter and your reply are by no means exceptions. It seems to me, however, that a slight re-casting of the sentence from "Of the tonnage hoisted, 626,000 tons was crushed" to "Of the tonnage hoisted, a large quantity—626,000 tons, to be exact—was crushed" (Editor, please don't spell it crusht) would put the matter beyond controversy.

The value of perspicuity was impressed forcefully on me recently, while wading through a book on metallurgy. The author had a valuable message to deliver to his coworkers, but he couched it in such ambiguous language that, in places, it was difficult to reconcile the text with what, from my knowledge of the subject, I knew to be the author's meaning.

San Francisco, February 23. F. H. MASON.

Utah University

The Editor:

Sir—In your issue of March 27 there appears, under the caption 'Schools and Societies,' on page 497, a statement regarding conditions at the University of Utah. This information has evidently been taken from the newspaper reports that have spread over the country, and does not represent the true state of affairs. For this reason I would greatly appreciate your giving space to the following remarks:

(1) The report that I have resigned is not true.

(2) The board of regents of the University consists of 14 members, 7 of whom are Mormons and 7 of whom are non-Mormons.

(3) The matter of bringing suit for the forfeiture of the charter of the University was dropped almost as soon as it was suggested.

(4) Careful investigation has shown that the Mormon question has nothing to do with the present difficulty at the University. The responsibility for such a statement rests upon the sensational newspapers of the country, which were quick to add this coloring to their reports.

Salt Lake City, March 30. ROBERT S. LEWIS.

P. S.—I might add by way of explanation that I am a native of Connecticut, a graduate of Stanford, and a non-Mormon.—R. S. L.

Rhythmic Precipitation of Colloidal Ores

The Editor:

Sir—With reference to Mr. Tays' letter on this subject in your issue of March 13: an insuperable difficulty, to my mind, to the acceptance of this hypothesis is the fact that in banded structures we often find every gradation from straight vertical layers, parallel with the walls, to successive banding with sinuous outlines, following the irregular shape of nuclei, or included fragments of country-rock. In the latter case, thin concentric layers of quartz, calcite, rhodonite, metallic sulphides, etc., will often follow the minutest irregularities of the nucleus, in such a way as to render it virtually impossible that successive shattering could have resulted in precisely similar successive exposures. Moreover, when we have bands of quite dissimilar composition, Mr. Tays' explanation still requires us to assume abrupt changes in the composition of the solutions that deposited them. The hypothesis of rhythmic precipitation from a gel is attractive in that it offers the only satisfactory explanation of such concentric banded structures.

The banding of mechanical origin, often marked by slickensides or gouge between the bands, is obviously different in character.

Denver, March 28. GEORGE E. COLLINS.

CONCENTRATES

Readers of the Mining and Scientific Press are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.

Converter slag is poured directly on to the ore beds at Douglas, Arizona, giving excellent results.

Antimony causes its lead alloy to expand slightly on solidification, a property that is used to great advantage in type metal.

In February 92 vessels, carrying 424,606 tons of freight, passed through the Panama Canal. Of this traffic, 41% consisted of coastwise cargoes.

The platinum being washed out of alluvial deposits in Colombia is associated with ultra-basic rocks and is derived probably from a rock rich in olivine, resembling dunite.

The copper mineral characteristic of the celebrated Chuquicamata mine, in Chile, is brochantite, the basic sulphate of copper, named after its French discoverer, Brochant de Villiers.

The celebrated Vielle Montagne zinc mine is situated in the little tract of neutral territory called Moresnet. This covers an area of 1½ square miles and is governed by a joint Belgian-German municipality.

The second delivery of radium from the plant of the National Radium Institute, being operated by the U. S. Bureau of Mines at Denver, was recently made. It consisted of 300 milligrams of radium bromide, having a market value of $19,000. This delivery of radium bromide is a small fraction of the radium extracted from the first 240 tons of ore treated in the experimental plant first erected. The crystallization of the radium itself has not kept pace with the extraction from the ore, owing to the impossibility to obtain certain special apparatus from abroad which is not manufactured in this country. Deliveries will gradually increase until they are equal to the capacity of the combined plants, which is approximately three tons of ore per day.

No. 5 reverberatory furnace, at the Washoe reduction works, Montana, has recently been remodeled for the purpose of using coal-dust firing in the place of grate firing, and the size of the furnace has also been increased from 19 ft. wide by 112 ft. long, to 25 ft. wide by 144 ft. long. This makes it the largest furnace of its kind in the world, according to the Anaconda company's safety-first publication, *The Anode*. Several valuable improvements in operating features have also been made. Thus, the charge, which was formerly dropped from hoppers discharging into the centre of the furnace, is now dropped from hoppers above each side of the furnace so that it forms a protecting pile against each side wall along its whole length except at the skimming end of the furnace, where a settling well is maintained to settle matte from the slag. This practice eliminates all necessity for fettling except at the settling well in front of the skimming bay. Slag is allowed to flow continuously from the skimming bay in the same manner that it does from the blast-furnace settler. Under ordinary operating conditions this furnace is now smelting an average of about 650 tons of charge per day, against an average smelting rate of 240 tons for the old furnace, and each ton of coal burned in the new furnace smelts about 7 tons of charge, while in the old furnace only about 4¼ tons was smelted for each ton of coal burned. Work on the construction of the furnace was started on December 10, 1914, and in spite of a delay of about three weeks, due to lack of materials, the furnace was ready for firing by February 5, 1915. This was accomplished without the occurrence of a single accident causing an incapacitating injury to any man on the job.

Water-supply for the Kalgoorlie and other eastern goldfields of the state of Western Australia is pumped 353 miles from the Helena reservoir, of 4,650,000,000-gal. capacity, through a 30-in. main conduit. While the water is of excellent quality for all purposes, and the pipes were coated before being laid down, there has been considerable internal corrosion, both by pitting and by incrustation. This had increased the friction and power used by the eight pumping stations, and decreased the capacity of the main. For some time past lime has been added to the water at No. 1 station near the reservoir to the amount of 6 grains per gallon. In the year 1913-14 a total of 1,194,591,000 gal. was consumed from the system, including the distributing pipes of 1175 miles. The crude lime contains from 55 to 70% of calcium oxide, and the amount of free lime in the water, which is equivalent to 2.5 gr. per gallon at No. 2 pumping station, becomes less as it travels toward Kalgoorlie, being 1.75 gr. per gallon at Northam, 1.5 gr. at No. 3, 0.5 gr. at No. 4, and 0.25 gr. at Kalgoorlie, 353 miles. Inspections made late in 1914 showed that a continuous coating of lime has been formed inside the 30-in. main along the greater part of its length, diminishing gradually in thickness from Mundaring (the reservoir) till traces only are found at Kalgoorlie. The corrosion and consequent formation of nodules in the main which were going on rapidly a few years ago appear, from the inspection made and from tests of friction in the main, to have been brought almost to an end.

Mining in the Far North

Placer Mining on the Seward Peninsula

By EMIL EDWARD HURJA

There were 42 dredges operating on the Seward Peninsula during 1914. A number of these have proved successful ventures from the very beginning. Three new dredges commenced operations during the year, and a fourth one is proposed as soon as the ground has been sufficiently proved.

One of the new dredges was built by the Union Construction Co., San Francisco, California, on Bangor creek a tributary of Snake river, for the Bangor Creek Dredging Co., composed of Cole, Mitchell & Brower. This dredge has buckets of 3½-cu. ft. capacity, in close-connected line. Power is furnished by two Bolinder crude-oil engines, of 60 and 80 hp. respectively. A plant is being constructed to refine asphaltum oil for use by the Bolinder engines. The crude oil, landed at Nome, costs $2.50 per barrel. It will be refined to a 24 degree gravity at the plant, which will have a daily capacity of 500 gal. One of the new dredges is operating on Arctic creek, a tributary of Cripple river, 14 miles northwest of Nome, and was built by the Flume Dredge Co. The third new dredge was constructed by the American Dredge Building & Construction Co. It has 2-cu. ft. buckets and is operating on leased ground on Anocovick river, Cape York. The Plein Dredging Co. closed down its dredge on Otter creek, four miles from Nome. Dredging operations in other parts of the Nome district are generally reported to have been successful, demonstrating the success of the type of dredge developed for the shallow placers of Seward Peninsula. There are six dredges working within a few miles of the city of Nome, but the more promising dredging fields are Candle, Council, Kougarok, and Inmachuk.

Dredging costs in general on Seward Peninsula are not thought to be excessive, considering the remoteness of the district and the unusual conditions encountered. Operating costs in Seward Peninsula dredging are said to run from 15c. per cubic yard up. One dredge, a 3-cu. ft. close-connected U. C. Co. type, operated on the Kugruk river this summer, is reported to have operated at a cost of 9c. per cubic yard, without counting depreciation. This was possible because of ideal conditions, such as thawed ground, no hard bedrock, easy digging, etc. The dredge is owned by Coffin and Johnson.

The most important company operating on Seward Peninsula is the Pioneer Mining Co. Its work is conducted under the supervision of Jafet Lindeberg, president and manager. Though considerably hindered by lack of water for sluicing, the Pioneer Mining Co. operated successfully during the 1914 season. The Company maintains six hydraulic elevators in the Nome district, but operations during the past summer were confined to three lifts for a greater part of the time. Water is supplied through a system of ditches costing approximately $500,000. The principal ditch is 40 miles long, 6 ft. deep, and 16 ft. wide at the bottom. There are several tunnels through solid rock on the ditch line, and there is also a siphon at Hobson creek which is 6 ft. in diameter and 3100 ft. in length.

Dredges operating in the immediate vicinity of Nome, not included above, are the Saunders Creek dredge, the Julien dredge, the Middaugh dredge, the Wonder Creek dredge, the Nome Gold Gravel Co. dredge, the Hastings Creek dredge, and the Ernst-Alaska dredge.

The dredge of the Arctic Gold Dredging Co., of which Frank Middaugh is manager, operated part of the season on Hobson creek. The Hastings Creek dredge, formerly on Moss gulch, worked on Hastings creek during the summer. A. N. Hansen is manager of this dredge. The Julien Gold Dredging & Mining Co., of which Victor Julien is manager, worked with success on Osborn creek during the sluicing season. The Saunders Creek dredge, owned by Andy Anderson will probably be moved to the Snyder group at the mouth of Center creek during the winter, as it has worked out the available ground on Saunders. The Wonder Creek dredge is working on the E. W. Johnston ground. E. E. Powell is manager of the Company.

Hydraulic operations in the vicinity of Nome, as elsewhere in the district, form quite an important part in gold production. On Center creek eight different outfits have worked during the summer, on a scale varying from a hydraulic elevator to minor hoisting operations. There are two outfits on Anvil creek, one on Lindblom creek, and others on Oregon creek, Newton gulch, Gold Bottom, and Banner creeks. Eight plants operated on Dexter creek and two on Boulder creek. Stewart and associates, on Sledge creek, have driven a drainage tunnel 1100 ft. long. The same men also intend to operate on Monument creek.

Council City District

The largest operator in the Council district is the Wild Goose company. Others are the Blue Goose Dredging Co., Saupe & Kimball, Oro Dredging Co., Warm Creek Gold Dredging Co., Nome-Montana-New Mexico company, Flume Dredging Co., Willow Dredging Co., and Ruby Gold Dredging Company.

In the Council district the first discovery of gold was made in 1866, by D. B. Libby, a member of a party which was attempting to build a telegraph land line around the world. In 1897, H. L. Blake, A. P. Mordant, L. F. Melsing, and Libby left San Francisco for that district, and in April 1898 located rich ground on Ophir creek. A stampede followed. The 1914 output of the Council district was encouraging. It was placed in excess of one million dollars.

The Wild Goose Mining & Trading Co. was organized in 1899, with a capital stock of $1,000,000. J. Dennis Arnold is president of the Company and Fred M. Ayer is resident manager. The home office is in San Francisco.

In 1911 a dredge was built by the Wild Goose company on No. 27, Ophir creek, a tributary of the Neukluk, 90 miles from Nome. The dredge has worked down the creek until it is now on No. 22 Above, Ophir. The dredge was built by the Yuba Construction Co., and is equipped with buckets of 3½-ft. capacity and has a daily capacity of 2000 cu. yd. The motive power of the dredge is furnished by a 125-hp. vertical type four-cylinder engine designed by L. F. Washburne, dredgemaster of the Wild Goose company. It was built in San Francisco, and is stated to have given satisfaction in the operation of the dredge and effected a saving of one-third in the fuel bills. The Wild Goose dredge, according to Mr. Ayer, has eight seasons' work ahead of it, the average Nome season being from June 20 to October 27, or 129 days. The Company also operates a Joshua Hendy hydraulic elevator with a 3¾-in. nozzle on 2 Above, Ophir creek. Water is supplied by a system of ditches 16 miles long. The intake is at the cañon on Ophir creek. In the dry season, additional water is obtained from the Paragon ditch, 10 miles long, with its intake at Helen creek. The operation is on the benches of the creek, where the ground is from 8 to 14 ft. deep. Operations of the Wild Goose company in the vicinity of Nome are confined to Cooper gulch, 4½ miles from Nome, a 2½-in. nozzle being used. Here lessees are operating in a small way. The Company also owns

the Seward ditch, 36 miles long, which supplies water for the Company's needs as well as for some independent operators.

A pipe-line which has been under construction for a number of years will increase the flow of water in the Seward ditch. The pipe-line will take water from the Crater Lake reservoir at the head of the Grand Central river, and its outlet will be the Nome river, which feeds the Seward ditch.

The Wild Goose company owns 110 claims on Seward Peninsula. Fifty of them are on Ophir creek, and the rest are in different parts of the Nome and Council districts.

The Blue Goose dredge is owned by the Blue Goose company, of which A. N. Kittleson is manager. It was on 8 Above last season and has four years' work ahead of it. The dredge is in its twelfth season. Operation in 1914 started on May 28. It is said that clean-ups for a part of the summer showed an output as high as $3000 per day. The Blue Goose company also worked a hydraulic elevator on Ophir creek during a part of the season. The dredge of the Warm Creek Dredging Co. started work early in July and is said to have had a successful season. It is managed by A. E. Wellington.

A 1½-cu. ft. flume-type dredge was built last season and installed by the Oro Dredging Co. on No. 1, Elkhorn creek. Although a little trouble was encountered early in the spring, better results were reported later in the season. Charles Spencer is manager of the Company. The dredge of the Ruby Dredging Co, under the management of Claude Scott, on Casadepaga, is reported to have had a successful season. The flume dredge operated by the Nome-Montana-New Mexico company on Goose creek started work late in June. G. F. Ramsay is manager for the Company. The Willow Creek and Gaylord dredges also operated last season with success. The Flume Dredge Co. owns two 3½-ft. dredges of its own manufacture which are operating in the Council district. One is on No. 1 Crooked creek, a tributary of Ophir, and the other is on Melsing creek, a tributary of Neukluk river. The dredge on Crooked digs across the whole stream and to a depth of from 8 to 11 ft. The Melsing dredge has a 90-ft. swing and digs to an average depth of 10 ft. Distillate is used for fuel. It costs 35c. per gallon delivered in 55-gal. tanks at Council City.

There has been some hydraulic work in a small way in the Council district. Trolsen & Streifeld, working No. 1 and No. 2 Above Discovery on Ophir creek under lease from the Wild Goose company, have used hydraulic elevators successfully. Kenna & Elms, leasing from the Northern Light Mining Co., had a good season on the Ophir benches where they worked. W. K. Taylor & Co. used scrapers on No. 23, Ophir. Vallentine & Peterson and T. J. O'Shaughnessy & Co. have been carrying on open-cut work on Dutch creek. Stitch & Roberts had a successful summer on Crooked creek. Gawiler & Gloor operated a steam scraper on Melsing Creek bench last summer. William Brookins & Co. used a hydraulic elevator on Camp creek. The Uplift Mining Co. is said to have made plans for a flume-type dredge on Camp creek next year. They prospected some ground for a few months last year.

Solomon River District

Dredging in the Solomon River district has been an important factor in the history of the Seward Peninsula gold production. The first dredges in the district commenced operations in 1905 and have been operating ever since that time. At present there are nine dredges at work and another may be built next year. Several companies are conducting prospecting operations in the district and expect to build boats as soon as the ground has been proved. If the experiment of the Seward Dredging Co. with Diesel engines during the fall is successful and develops a lower working cost than was possible under the old system, it means that ground which heretofore would not pay to dredge will become available for dredging purposes. In the same district the Nome-Montana-New Mexico company's dredge uses coal for fuel.

The Flodin Mining & Dredging Co. operates a Risdon dredge on Solomon river. A flume dredge with buckets of 3-cu. ft. capacity, operated by the Flodin company, shows a low working cost; power is furnished by a 60-hp. gasoline engine. The Solomon dredge, operated by the Solomon Gold Dredging Co., of which J. A. Mallock is manager, has worked out all of its ground and probably will move to new claims during the winter. It is stated that this dredge has averaged 60,000 cu. yd. per month. It is driven by steam, with crude oil for fuel.

The Sievertson-Johnson dredge on Solomon river, in charge of Charles Sievertson, experienced some trouble during the season past because of bedrock encountered. The Shovel Creek dredge, owned by the Shovel Creek Dredging Co., of which C. C. Brayton is manager, operated successfully throughout the season.

C. E. Kimball operates two dredges of the Flume Dredge Co.'s manufacture. One is on 18 Above, Shovel creek, a tributary of Solomon river, 41 miles northeast of Nome. The buckets have a capacity of 2½ ft. and the dredge a capacity of 1000 yd. per day. Power for the dredges is furnished by 60-hp. Western gasoline engines. The dirt is dumped by the buckets on a grizzly. From the grizzly it goes into the main flume, 75 ft. long and 48 in. wide. Another Flume dredge, on Adams creek, a tributary of Shovel creek, 47 miles from Nome, is digging to a depth of 7 ft. and only requires 18 in. of water for flotation.

The Behring Dredging Co. operated a hydraulic lift last season on the Kougarok below the mouth of Taylor creek. The Company plans to build a dredge on its ground near Henry creek next spring. The dredge which is being constructed by the Union Construction Co., of San Francisco, is at Davidson's landing and will be freighted overland to Kougarok during the winter. It has a close-connected line of buckets of

BOURBON DREDGE SNOWED IN.

KIMBALL No. 2, FLUME DREDGE.

3-cu. ft. capacity. Its capacity will be about 1500 yd. per day. Motive power will be derived from two 50-hp. Webster gasoline engines. Hutton & Flodin, old-timers in the North, prospected all summer on their Kougarok river holdings, with a view to installing a 2½-ft. Union Construction dredge which was brought to Nome for them in 1913.

The White Bear Dredging & Hydraulic Mining Co. is having a survey made of its claims in the Kougarok and expects to construct a dredge on the ground soon. Charles Flodin is planning to build a dredge on Serpentine creek on the upper half of the Halpin ground, below the mouth of Artic creek. A dredge for the Taylor Creek Ditch Co. will be built on Taylor creek during the winter. The dredge machinery was transported from Teller to Davidson's Landing last summer and will be freighted to its destination over the snow. The Company has extensive property holdings in the Kougarok. John Mathews is manager for the Company. Because of difficulty in transportation, the new dredge of the Kougarok Dredge Co., J. Halpin, manager, has failed to reach its destination on Iron creek. A caterpillar automobile was used during the summer, but without success. The Company owns 200 acres of placer ground in the district. The dredge will be operated by two gasoline engines having 125 combined hp. The maximum dredging depth is 35 feet.

The Kelliher dredge, owned by James Kelliher, operated spasmodically during the summer, due to difficulty encountered at bedrock. Uneven thawing probably will be eliminated after stripping operations now under way are finished. A seven-mile ditch has been built for hydraulic operations and three nozzles are being used to strip ground ahead of the dredge. Operations in the Kougarok have been retarded somewhat by the European war, and foreign capitalists who were becoming interested in the district have called off their plans indefinitely. Considerable mining on a small scale has been going on, five outfits being engaged on the upper Kougarok gravels and several small prospecting parties worked during the summer on Sherrett creek. The Nome Gold Mining Co. is considering a dredge for its property on Sherrett. The Company has spent three years in prospecting the ground. Grant Laiblin is Nome agent of the Company. Two outfits worked on Willow creek, in the Pilgrim River district.

Operators in the Candle district, which is included in the Fairhaven mining precinct, report a successful summer. The Keewalik Mining Co. operated on Johnny Bull hill. Elmer Rydeen operated a hydraulic elevator on Bear creek during the summer. The Candle Creek Mining Co. owns a number of claims on Candle creek on which work was done last season. The Kugruk River district is near the Inmachuk watershed, both heading into the same district. A Union Construction Co. dredge was built last summer on the holdings of Henry Coffin and Iver Johnson. This boat has a close-connected bucket line, with buckets of 3 cu. ft. capacity. Prospecting work with a drill was carried on throughout the summer. The Dearborn Investment Co., which owns considerable ground on the same creek, has been conducting a thorough investigation of the merits of its claims. A dredge is a possibility. George Wallin prospected his Kugruk ground with a drill last summer. Operations of the Candle Gold Dredging Co., of which E. E. Pierce is manager, proceeded satisfactorily on Candle creek.

In the Teller district the American Dredge Building & Construction Co. added another dredge to the one already operating on the Anacovick river, Cape York section. Both dredges are of 800 cu. yd. daily capacity. The Company is managed by B. Bernard. J. A. Pidduck, manager of the Pidduck dredge on Sunset creek, across the bay from Teller, reports that his operations have been satisfactory. New pay is said to have been found in the benches. The dredge of the Johnstone company has been taken over by Sullivan & Dorn. The new owners are said to be contemplating building another dredge next season. They had several drills at work the greater part of the summer. The dredge Windy Creek, owned by the Pasadena Dredging Co., had a fair season. Considerable prospecting has been going on in different parts of the Teller district.

Throughout the Inmachuk district, there was a lot of new work during the summer. The Union Construction Co. 3-ft. dredge, owned by the Inmachuck Dredging Co., reports successful operations in the upper Inmachuck during the summer. The Fairhaven Mining Co. is operating several hydraulic plants in connection with a 40-mile ditch from Lake Imuruk. The 2-ft. dredge owned by the Deering Mining & Dredging Co. operated on lower Inmuchuck to the satisfaction of Henry Fries, president of the Company. There is a lot of small work going on in the district, the output of which adds to the annual production of the Inmuchuck.

Kobuk District

The mining in the Kobuk district is centered largely about Klery creek. The Kobuk is tributary to Kotzebue sound, north of Nome, and most of the producing streams are tributary to its watershed. Supplies are landed at the mouth of Squirrel river, in Kotzebue sound, at a cost of $22 per ton from Seattle. The goods are then taken by launch up the river. Klery creek was discovered in 1909. It is 18 miles long and flows into the Kobuk 60 miles from its mouth. Andy Garbin and 'Spanish Jack' are the original discoverers of Klery creek. Their claim, the Oregon association, has produced $45,000 since its discovery. The lower 600 ft. of 1 Above Discovery has yielded $60,000 since discovery. The paystreak is 50 ft. wide. The men still conduct summer work on their claim. Theodore Westlake, Steve Ryan and Leo Jeffe are working on 1 Above, Klery creek. They took out a $10,000 dump last winter. The ground on Klery is frozen and has a depth of from 12 to 14 ft. On Klery No. 8 Above, Joe Quillan is prospecting. Paul Xavier, Josh Devine, Albert A. Ryan, and E. R. Burden are working on 5 Above Discovery, first tier, left limit, of Klery creek. They are shoveling in after having ground-sluiced off the overburden. The ground is from 12 to 15 ft. deep. The men manage to make from $8 to $10 a day.

Tin Prospects

The average content of tin in the concentrates of the York Tin Dredging Co. is 68%. The tin in veins so far discovered ranges from 3%. The known tin area of Seward Peninsula is about 200 square miles, terminating at Cape Prince of Wales. Ear mountain, on the Arctic side of the cape, is reported to contain large quantities of tin ore. In the Lost River region, farther south, tin is also found. The York Tin Dredging Co. has a 2½-ft. Union Construction Co.'s dredge in operation on Buck creek, which flows into Grouse creek. Grouse creek flows into Mint river, which, in turn, empties into the Arctic ocean. The dredge is operated by two 40-hp. Union gasoline engines. Operations in 1914 started July 15. An average season is 115 days long. The 1914 output is estimated at 75 tons of stream tin. The ground worked is from 5 to 8 ft. deep. Considerable money is said to have been spent in the search for a tin vein on Cape Prince of Wales mountain. It is reported that a ledge 2 ft. wide has been discovered.

The Lost River mines are being operated by the Lost River Tin Mining Co. George Jamme is manager. The vein on the property is said to be 12 ft. wide and contains 3 to 4% of tin. It is reported that a 60-stamp mill will be built on the property in 1915. A gasoline-operated sampler comprises the present equipment. The Bartels Tin Mining Co. owns 32 patented claims in the district. A three-stamp mill has tested 300 tons of ore and, it is stated, found an average content of 3%. Twelve hundred tons of tin ore are on the dump. The United States Tin Mining Co. owns four patented claims adjoining the Bartels property. A 10-stamp mill has recently been erected. The main adit has a length of 400 ft. and must be driven about 100 ft. more to cut the ledge. T. Winfield has a crew of men prospecting a tin vein in the Ear Mountain district and there are a number of other properties that have attracted attention.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

JOPLIN, MISSOURI

Re-opening West Joplin Sheet-Ground Mines.—Large Production from Webb City Sheet-Ground District.—Important Development at Granby, Missouri.—Notes.

Four mines in the West Joplin sheet-ground district that have been idle for more than a year are to resume operation, while another company is contemplating the erection of a 500-ton concentrating plant in that field. The former are the Martha Ball Zinc & Lead Co., now known as the Bradley No. 2, the Falls City Lead & Zinc Co., the Muskingum Lead & Zinc Co., and the Samson Mining Co. The new plant is to be constructed by the S. Y. Ramage Mining Co., at present a large operator in the Webb City district. The Ramage company for more than a year has been drilling on a 120-acre lease to the south of the Samson and the other mines mentioned, and it is reported that 18 drill-holes out of 20 are into sheet ore at a depth varying from 175 to 200 ft. Virtually all of the mines of the West Joplin sheet-ground district suspended operations about a year ago when ore prices reached a low level. The present high price of zinc ore has stimulated mining, and the reopening of these properties should mean a large tonnage added to the weekly production. The Samson mine will be under operation of W. J. Briggle, who formerly operated this property. Work was conducted at a depth of 175 ft., but the stope will be taken up as there is about 8 ft. of ore beneath the present drifts. The Muskingum mine is under the supervision of Charles U. Porter, and work is being conducted at a depth of 200 ft. The Falls City is under the management of George Bayless. Production has not yet begun, as the Company has experienced some difficulty in draining the ground, and larger pumps are being installed. W. S. Pate is in charge of operations at the Martha Ball, or Bradley No. 2, the work here also being at 200 ft. The ore in the West Joplin sheet-ground area is extensive in formation, but does not carry a high percentage of either zinc or lead. The zinc-blende recovery is about 3%, with a much smaller percentage of lead. The cleaned concentrate, however, runs high in metallic zinc, and commands a high settlement. On the Ramage lease, an old shaft is already down more than 100 ft., but it did not reach the orebody. This shaft is to be sunk deeper.

The Webb City-Carterville, Missouri, district is, as has been the case for the past six or seven years, leading all other fields of the Missouri-Kansas-Oklahoma district in the output of both zinc and lead ores. For the first quarter of 1915 the Webb City-Carterville district has shipped zinc and lead ores valued at $1,341,237, compared with the Joplin production of $660,264, which is the next largest producer, and $445,162 from Miami, Oklahoma, the third. Duenweg, Missouri, comes fourth; Alba, Missouri, fifth; Galena, Kansas, sixth; and a number of other minor camps with smaller production. The aggregate value of zinc-blende shipped from the district for the first quarter is $3,460,000, calamine $180,000, and galena $444,000.

A concentrating plant of 1000-ton capacity per 24 hours, embodying several new features in milling practice, is being constructed by the Granby Mining & Smelting Co. on its own property at Granby, Missouri. Shaking-screens will be placed at the heads of all jigs, and the fine removed before passing over the jigs. Special jigs will be installed for treating the fine ores. Electric power will be used. The shell-work of the mill will be of galvanized iron. A separate unit, also of galvanized-iron construction, will be erected for treatment of sludge ores. The initial equipment will consist of 15 tables. Later, three double-deck sliming-tables will be installed. This work will be the second active mining venture of the Granby company, which, in the past, has adhered closely to the leasing end of the business. About a year ago the Company constructed a 350-ton concentrating-plant on its property at Joplin, and this was the first time the Company had engaged in active mining. The success of this undertaking caused the Company to launch out on a broader scale at Granby. A lease of 40 acres has been reserved by the Company for these operations. A number of drill-holes are into disseminated zinc ore at a depth of 185 to 230 ft. One shaft is already down into ore, and driving has been started. A second shaft is now being sunk. The mill is being constructed at the completed shaft, and a tramway will connect with the other.

WEBB CITY SHEET-GROUND DISTRICT, MISSOURI.

The Carl Junction, Missouri, district, eight miles northwest of Joplin, is having a revival of activities as a result of higher ore prices. The Chicago-Lehigh Mining Co. is driving east into virgin ground, in sheet formation, at a depth of 125 ft. The mill is now producing two carloads of concentrates per week.——The Webb City-Lehigh Mining Co.'s plant is being overhauled by David Gilmore and associates, and this property will soon be running.——A new prospect is being opened at a depth of 105 ft.——The Joplin-Lehigh mine is running steadily, and producing on an average of six carloads of blende concentrate per month.——Marshall & Co. are sinking a new shaft on the Baby Kitty lease of the

Knight land, and contemplate the erection of a mill on this property.——The old Jay shaft ground is being drained to a depth of 132 ft. by Tom Raddish & Co.——Lightburn & Co. are opening the old R. C. Johnson Mining Co. some distance to the east of the main Carl Junction camp.

At a depth of 125 ft., driving has been started in the Louis Stevison mine on his own land, two miles north of Oronogo, Missouri. This work is in a new district, the nearest mines being the heavy-producing Oronogo Circle properties. Mr. Stevison has 18 drill-holes in ore, four or five of which were rich enough to warrant development. A larger derrick has been erected and steam equipment installed.

Noe & Elliott, operating on a 10-acre lease of the D. O. Witmer land, southwest of Joplin, have extended an old drift into new ground at a depth of 125 ft., and are taking out zinc ore which yields 12% concentrate over hand jigs. Much of the ore occurs in large chunks, and can only be cleaned satisfactorily in a mill. Only the finer 'dirt' is being cleaned over hand jigs. The mine has not been worked for nine years. Formerly it produced some ore, but operations were abandoned because of low ore-prices that prevailed. The present operators found no trouble in removing the water from the mine with a 3-in. pump. They have installed a 40-hp. boiler, and are now making a steady production of ore, and at the same time are developing their land to such an extent that it appears to be a good mill property.

NEW YORK

NEW MINING REGULATIONS IN MEXICO.—FEDERAL MINING & SMELTING AND AMERICAN ZINC, LEAD & SMELTING COMPANIES.—COPPER.—UNITED STATES SMELTING, REFINING & MINING CO. AND NEW PROPERTIES.

The troubles of mining men in Mexico have been augmented by a recent promulgation of Villa. The edict provides that work must be resumed on all mining properties within territory under the dictator's control within 120 days, or confiscation will ensue. Since transport is practically impossible, such resumption is out of the question in many cases. Other provisions of the new mining law provide for restriction of ownership. No individual can hold more than 15 contiguous *pertinencias*; no mining company more than 150 *pertinencias*, and every five *pertinencias* so held must be developed by two shafts. A large number of operators interested across the border held a meeting at El Paso this week, and endeavored to institute some concerted action, hoping to move the State Department at Washington and avert complete chaos. The statement is freely made that this is but the first of moves to drive all foreign capital invested in the mining industry in Mexico out of that country. It seems incomprehensible, but these are days when our comprehension must get used to the high hurdles. There is no reason to anticipate any action by our own State Department, since there has already been such an accumulation of reasons for action and none taken.

A group of insurgents in the United States Reduction & Refining Co., a concern that at one time operated profitably at Cripple Creek, is trying to organize opposition to the present management, with a view to renewing the company's activities. This company's securities are listed on the New York Stock Exchange, and are largely held in the East.

The Federal Mining & Smelting Co. shows a deficit of $46,908 as the net result of its operations in 1914, compared with $29,150 in 1913. With lead and zinc both advancing, and buyers taking everything for near-by deliveries, the outlook for these companies that have not been quite able to break even ought to improve materially. This viewpoint has nothing to do with mining problems, but is all-important for the investor who has nerve and judgment enough to come in when things look blue.——The American Smelting & Refining Co. has advanced the price of lead to 4.20c.——One of the lead-mining companies in the northern Illinois districts is reported to be filling an order for 1,000,000 lb. sheet lead. ——The sudden reversal of conditions in the market for lead and spelter has affected the American Zinc, Lead & Smelting Co. as sharply as any concern in the business. From a deficit of $169,000 in 1913 to an earning of $2,000,000 or more in 1915 is something to make stockholders and managers catch their breath. If present prices hold, this company can reckon on earnings for the year of more than $3,000,000. The two smelting plants at Caney and Dearing, Kansas, are being operated largely on Butte & Superior ores. The combined capacity of these plants is about 65,000 to 75,000 tons of zinc ore annually. Of the 12 blocks of furnaces, 9 are devoted to Butte & Superior ores, 2 on other contract ores, and the remaining block is devoted to refining, turning out a special grade of metal that sells at a premium. The amount derived from the extra price for this product is stated to be from $750 to $1000 daily above what would otherwise be received for ordinary metal. The great danger arising from prevailing abnormal conditions will lie in the temptation to expand unduly in order to take care of business offering, with the possibility of having too much plant and too much overhead expense on hand when the slow-down comes, as it must come, after peace is restored and the painful work of repairing waste and re-building destroyed property begins. Our own fertile South, with its great staple crop of cotton and its cheap negro labor, after having poured itself into the struggle of the Civil War, faced a long period of slow re-construction from which it took years to emerge. We suffered in our own land something of a shock, a terrific shock, financially, when war was declared; we must be prepared to undergo a further strain when the European struggle is over and the emergency business comes to an end.

Copper producers are getting back into full stride as rapidly as possible. Michigan especially is feeling the effect of war orders, and Lake copper continues to hold its premium of approximately one cent per pound above electrolytic. Rush shipments are being made from all the smelter yards in the northern peninsula. The copper people are all optimistic. The uses for copper have so multiplied that it is not likely to feel the cessation of abnormal demand in anything like the same degree as some other commodities. It has for some years been evident that the world can take all of the copper that can be turned out, if prices are kept within reasonable bounds.

The United States Smelting, Refining & Mining Co.'s report for 1914 shows $1.75 per share earned on the common stock after payment of the preferred dividend, compared with $5.35 per share earned in 1913. The decrease, of course, is due largely to the distressing conditions in Mexico; the Real del Monte and the Pachuca have had troubles of their own during the year, and from present indications are likely to find them increased rather than otherwise, especially if the various rivals for leadership in Mexico begin to make it fashionable to impose impossible and outrageous conditions on mining companies controlled in this country or abroad. As usual, not the least interesting part of the report of the company relates to its attempts to find new ventures worthy of exploitation. During 1913 some 639 properties were submitted to the engineering staff, all but 101 were rejected on examination of data and reports, 82 of the remainder failed to pass preliminary field-examination; and out of the remaining 19, two oil properties were taken over, and a long-time option secured on an interest in a third. Evidently the complete answer to 'What Is the Matter with Prospecting?', the interesting symposium published in the *Press* in 1914, has not yet been found, when out of 639 properties there is not discovered a single metal prospect worthy of development. It is undoubtedly true that there has grown up a disposition to eliminate the natural mining risk in taking up new ven-

tures. Just what is the reason for the attitude of our development companies it is hard to state. Is it not possibly because geological conditions are so well known? The possibilities and probabilities in almost every mining district are perhaps so well classified and card-indexed that it is an exceedingly difficult matter for the prospector, or group of claim-owners, to bring in anything that is really new. Whatever it may be, there hardly exists anywhere a more hopeless task than lies before the owner of undeveloped ground seeking to raise capital in Eastern financial centres.

The Calumet & Hecla is just bringing its subsidiary, the White Pine, into the producing list. The property is on the western extension of the copper belt, is expected to turn out 18,000,000 lb. per annum, and to be a low-cost mine.

TOKYO, JAPAN

Coal-Mine Explosions.—Kosaka Mine Output Declines.—Gold, Silver, and Copper Production of Certain Mines.—New Ironworks.—New Smelter in Korea.—Oil Refining.

The problem of coal-mine explosions is a serious question in the Japanese mining industry. On December 13, 1914, two weeks after the big explosion in the Wakanabe Shin-Yubari coal mines, Hokkaido, resulting in the death of 422 employees, another still greater explosion took place in the Hojo-Tanko colliery, a mine in Kyushyu, 35 miles southwest of Moji, belonging to the Mitsu-Bishi-Kaisha. The total number, including engineers and officers, killed by the explosion was 670, being the greatest disaster that has occurred in the history of Japan. Special attention has been given to save the mine, and also take care of the families of the dead. On January 31, 1915, a small gas explosion took place in the Koyaki coal mine, Nagasaki-Ken, by which two miners were instantly killed and 15 were seriously injured. It is supposed that this was caused by a defect in a safety lamp.

The Kosaka mine, owned by Fujita-gumi, of Osaka, which for a time stood foremost in its production of copper, silver, and gold, is now declining, and it has recently been decided to reduce the scale of the working to one-half. In its production of copper it ranks third among the Japanese copper mines, the Ashio mine coming first and the Hidachi next.

The production of metals in the important mines of Japan till the end of November 1914 (11 months), was as follows:

Gold—Hidachi, 75,048 oz.; Sado, 14,900 oz.; Yamagano, 12,152 oz.; Kosaka, 10,200 oz.; Kushikino (Kagoshima-Ken), 10,206 oz.; Kamaishi, 6085 oz.; and 19 other mines, 44,286 ounces.

Silver—Kosaka, 887,817 oz.; Hidachi, 670,043 oz.; Tsubaki (closed in September 1914), 453,320 oz.; Ashio, 297,044 oz.; Kamioks (Gifn-Ken), 254,862 oz.; Ikuno, 206,412 oz.; Abeshiro (Awomori-Ken), 198,123 oz.; Sado, 135,032 oz.; and 20 other mines, 980,457 ounces.

Copper—Ashio, 22,227,561 lb.; Hidachi, 20,647,052 lb.; Kosaka, 15,413,720 lb.; Betshi, 15,023,456 lb.; and 38 other mines, 52,081,869 pounds.

The Mitsu-Bishi Co., last year planned to erect ironworks in Kenjiho, Korea, but on account of the war the construction of the plant has been suspended for a time, as it is now impossible to get the machinery, all of which has been ordered from Germany. The net profit of the Mitsui Mining Co. in 1914 was 1,405,226 yen ($702,000).

The Kuhara Mining Co., the owner of the Kidachi mine and smelters, is going to erect a new smelting plant in Chinnampo, Korea. Chinnampo is a well situated seaport on the southernmost coast of the peninsula, with good communication both on land and sea. The Company possesses a number of copper-bearing iron pyrite mines on Skikokn island. These basic ores will be smelted together with gold quartz from Korea, which occurs abundantly throughout the peninsula. It is expected, after the completion of this smelter, that the yield of gold from Korea will be considerably increased.

The Nippon Oil Co. intends to construct open and shut retorts of the Russian type for refining oil in Akita, where

PART OF HOKKAIDO.

large quantities of oil in flowing wells was struck last autumn, in drilling with rotary drills of American make. An engineer of the Company is now in Russia to get the retorts.

HOUGHTON, MICHIGAN

Operations Returning to Full Capacity.—Copper Prices.—Calumet & Hecla Smelter.—Hancock and Ahmeek.

Conditions in the Lake Superior copper region continue to improve and to profit from the continuation of the deplorable European war. Each week records the re-opening of some mine or mill, an increase in working force, or an increase in wages to the men. With all the producing mines back to normal production, a spirit of optimism prevails, and all are looking forward to a most prosperous and productive spring and summer.

This revival of mining operations is due directly to the advance in the price of copper. Operating costs at some of the Michigan copper mines are so high that when copper drops much below 15c. per pound the margin of profit is small. But with Lake copper selling between 16 and 17c., every Michigan mine will take full advantage of the unusual opportunity offered. Another reason for the present increasing production of the Michigan mines is that Lake copper is specified in contracts, and foreign governments are specifying in their ammunition orders that Calumet & Hecla or Quincy copper, and none other, be used. Never before has Lake copper commanded such a high premium per pound over elec-

tiolytic copper. The high premium for Lake brands has naturally resulted in a revival of interest in Lake copper shares. Notable advances have been made, and in some cases shares have doubled in price in the past two months.

It now seems that the present copper prices are due directly to the war, and that the higher price can be maintained only by a continuation of the war. It is reported that Lake Superior copper is being specified in contracts for ammunition, and that contracts for Lake copper are being made at prices above 16c. for July and August deliveries. It is also pointed out, however, that these contracts are subject to cancellation before the time of delivery, and if the European war should end before that time, it is probable that these contracts would not be filled. The report comes from Boston that copper sales as high as 17c. have been made by the Calumet & Hecla selling agency. The sales consisted of small lots of highest-grade copper, and were contracted for August delivery. This is the first time since November 1913 that Lake copper has sold above 16 cents.

As evidence of the faith of the Michigan managers in the copper market, several important announcements were made during the past week. The Tamarack mine of the Calumet & Hecla will resume mining operations at shafts No. 3 and No. 5 as soon as possible. When copper dropped to 11c. soon after the beginning of the War, this mine was forced to close. It has the highest producing-cost of the Calumet & Hecla subsidiaries, and its re-opening certainly shows confidence in the copper market and is most pleasing to the people of the locality. A great many of the best Tamarack miners were given work in other Calumet & Hecla mines following the suspension of operations, so that they are now available for their old positions. Plans for the immediate re-opening of the Calumet & Hecla No. 18 shaft have been completed. Both of these increases in operations mean an increase of several hundred men to the working force at Calumet.

One or two of the mines in the Michigan district cannot increase their present output because their mills are now running at full capacity. The Quincy has not as yet made any large increase in operations, and apparently has not as much faith as others in the stability of the copper market. However, a slight daily increase in production is reported, costs are being lowered, and a ready market is being found for its copper. Isle Royale will no doubt show a marked increase in production this year. Costs will correspondingly be reduced. The surface work at the No. 1 shaft is nearing completion and retimbering of the shaft below the eighth level has been resumed. It is reported that production of copper from the Baltic and Champion mines of the Copper Range Consolidated will be 15% above normal for the month of March. Trimountain is preparing to increase its output. Baltic has been making better than 30 lb. of copper per ton several months and Champion is showing a remarkable yield of over 30 lb. per ton on a tonnage twice as large.

The working force at the Calumet & Hecla smelting plant has been greatly increased during the past month. Two additional furnaces went into commission at the smelter last week. Unusually large rail shipments of copper are being made each week and the opening of navigation on the Great Lakes will find little copper on hand in the smelter yards. A great deal of the copper now being shipped from the Lake Superior district, however, is being delivered on January contracts, and at a price of about 13½ cents.

Hancock Consolidated has begun shipments of 'rock' to the Franklin mill, and an increase in working force will probably follow. It is reported that the Algomah is preparing to resume operations. The Algomah is in the exploration stage and has opened up a lode that is unique in the Michigan district. It is a brown amygdaloid carrying black oxide and green chrysocolla in irregular bodies.

The storage-bins at the Hancock mine are gradually being filled in advance of shipments to the Franklin mill. Underground work is being carried on by about 100 men, and a large number of drills are in operation. It is expected that daily shipments of about 200 tons to the Franklin mill will begin the first of April.——No action on the dividend has been taken by the directors of the Allouez Mining Co. Some of the larger stockholders have expressed a desire for some return on their investment. Production is now high and increasing gradually. The ore is good, costs have been reduced, and it is argued that a dividend of $1 would in no way embarrass the Company.——A total of 14,442 shares representing 161 persons has now been recorded in favor of the Ahmeek capital increase to 200,000 shares.

The itinerary of the annual visit to the copper district of the Bureau of Mines rescue-car has been announced as follows: Quincy, two weeks beginning April 19; Calumet & Hecla, two weeks following; Mohawk, the following week; Painesdale, the two weeks following. At the conclusion of the schedule, the car will be at the disposal of the Michigan College of Mines. It is probable that the car may go to Victoria before returning to its permanent station at Ironwood on the Gogebic iron range.

PORCUPINE, ONTARIO

DOME AND MCINTYRE YIELDS.—KIRKLAND LAKE DISTRICT.

During February the Dome mill treated 21,600 tons of ore and recovered a total of $84,412, or an average of $3.90 per ton, compared with $3.56 in January. The mill ran 97% of the possible time. Recent developments on the fourth and sixth levels have been satisfactory, and have succeeded in opening several bodies of ore of a considerably higher grade than the monthly averages. It is expected that there will be no difficulty in maintaining an average grade of about $4 per ton. The directors of the West Dome have issued a circular to the shareholders asking them to approve of changing the par value of the shares from $5 to $1, and the issue of five new shares of the new stock for each share of the old. The treasury will then contain 361,000 shares par value $1, which will be offered pro rata to the shareholders at 1½c. per share. This is expected to raise sufficient money to clear off the debts and pay the taxes for the next two years, but unless the Company succeeds in raising more money its position will not be improved. The West Dome was one of the best known properties in Porcupine a couple of years ago, and was floated by F. Augustus Heinze.

During February the McIntyre treated 10,900 tons of ore and recovered bullion to the value of $56,000. The ore averaged $8.77 per ton. This Company is gradually getting itself into a much better position, and at the present rate of earnings should be able to pay off the remainder of the bank loans in about four months.

The Nipissing has dropped its option on the Teck-Hughes mine in the Kirkland Lake district, although the position is such that the Company can take the option up again within the next 30 days. Just before work was stopped an extension of 30 days was given for the payment due March 1, and as the Nipissing had done sufficient work during the preceding month to keep the option in force for another month, they could if they desired take the option up again. All machinery has been taken off the property and the mine is being allowed to fill with water.——The Gibson Kirkland Lake Syndicate is the name of a new company which has been formed to take over seven claims in Teck and Lebel townships, about a mile north of the Tough Oakes mine. It is expected that development work will be started immediately.——The new mill of the Tough Oakes mine will be in commission within the next week or so, and from then on the property should be a consistent producer. About two weeks ago the Company succeeded in raising about $80,000 to pay off liabilities.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press

ALASKA

Juneau

At the territorial legislature at Juneau, Senator B. F. Millard introduced, on March 22, a bill to abolish the office of territorial mine inspector. It was referred to the committee on mining and manufactures. On March 24, by a vote of 15 to 1, the house of representatives passed the general 8-hour day mining bill, affecting all classes of mining in Alaska. Representative Dan Driscoll was the only one against the measure.

ARIZONA

Cochise County

It is reported that a smelter is to be constructed at Benson to treat ores from the Johnson district, 25 miles east, which is developing in a promising way. Benson is the nearest place where water and fluxes are easily obtained, and is on a railroad.

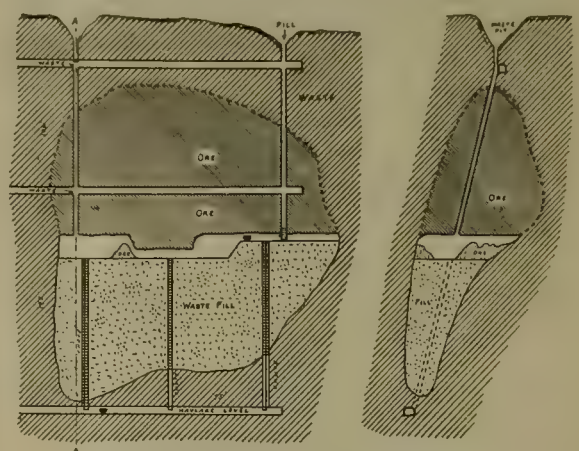
Gila County

Concentrate from the Inspiration company's 600-ton experimental plant is to be stored, instead of shipping to El Paso. The new International smelter at Miami is expected to be ready in May or June, about the same time that the 10,000-ton mill of the Inspiration is finished.

The report of the Arizona Commercial Mining Co. for the year ended December 31, 1914, shows that cash and accounts receivable in Boston and at the mine totaled $22,952, while supplies are valued at $13,983. Accounts payable at the mine were $7105; drafts outstanding, $4206; and notes payable at Boston, $50,000. The treasury contains stock worth $200,000. The president, Charles S. Smith, stated that connection had been made with the Grey shaft of the United Globe mine, and also with the main drift on No. 12 level of the Old Dominion, by a drift driven from the Arizona Commercial Copper Hill shaft, a distance of 1800 ft. Pumping and ventilation have been benefited thereby; also it is not now necessary to sink another shaft. Ore shipments were resumed on January 1.

Greenlee County

Mining methods of the Arizona Copper Co. are described by P. B. Scotland in the *Bulletin* of the A. I. M. E. for February. The mines of the Company are situated in the Morenci-Metcalf district in southeastern Arizona. This copper-bearing area covers a triangular mountainous area of about three square miles, rising abruptly from the gravel plateau of the surrounding country. In this area, an immense intrusion of porphyry has displaced, shattered, and engulfed the shales, limestones, and quartzites formerly bedded on the basal granite. The largest mines of the Company are the Humboldt and Clay at Morenci, and the Coronado, Metcalf, and King at Metcalf. These mines produce about 4000 tons per day of concentrating ore containing from 2.5 to 2.8% copper. The low-grade sulphide ore occurs as: (1) disseminated deposits in the main stock of quartz porphyry; (2) lode deposits in fault fissures in granite. The high-grade oxide ores were found as tabular deposits in limestone and shale close to contacts with porphyry. Low-grade oxide ore formed the outcrop of some of the sulphide orebodies; the majority of the outcrops, however, were barren. The method of extracting the ore is dependent upon the nature of the ore occurrence. Each orebody is a problem in itself. All influencing factors, as size, shape, position, nature, and grade of an orebody, and character of the inclosing walls, are fully considered before the method of extraction is decided. The oxide ores near the surface on Metcalf hill are extracted by open-cut work. Hand work is employed, steam-shovels not being necessary. Where the ore is hard and stands well, a system of open stoping without timber is employed with subsequent filling. In narrow veins with firm walls, underhand stoping directly into chutes is employed. In mining large orebodies, shrinkage stoping is generally used in conjunction with top slicing or block caving, the pillars separating the shrinkage stopes necessitating the use of either of the foregoing meth-



Longitudinal Section. Cross-Section.

SYSTEM OF OPEN STOPING AND FILLING AT THE ARIZONA COPPER CO.'S MINES.

ods for their removal. The principal mining method employed for many years in the district was square set and fill. The expense of using this system in the large bodies led to its disuse and the substitution of top-slicing methods. An excessive amount of timber had to be used in reinforcing the square sets to prevent serious caves, and the maintenance of rises to surface for waste became more difficult as the workings extended. The square-set method is, however, still employed in the extraction of orebodies of irregular shape and in the first stage of top slicing. Except in minor details, square-set practice here does not differ from that of other districts. A sub-level caving system is sometimes employed in mining the upper part of an orebody preparatory to top slicing. In narrow veins where filling is needed to support the walls, rill stoping is often employed. To eliminate the heavy expense of installing and maintaining chute rises every 25 ft. in the slices, a system whereby the ore will be loaded into cars directly in the slice is about to be tried out. In this system, which has been called 'panel slicing,' all of the working faces and all tramming will be on the same floor, and the use of tramming levels at 55-ft. intervals will be abandoned.

Air-drills are employed almost entirely in mining. Air at 100 lb. pressure is supplied by two Nordberg compressors of 4000-cu. ft. total capacity, direct connected to two alternating-current motors. One compressor at Morenci supplies the Hum-

boldt and Clay mines; the other at Coronado supplies the King and Coronado mines. One-man machines of various makes are used throughout. In slicing, 'jackhamers' are used in soft and water Leyners in harder ground. Giant ammonia powder of 30 to 40% is used in blasting, 1 lb. of powder breaking from 7 to 10 tons of ore. Prepared primers are issued to the miners from a number of supply magazines in the mine. Holman air hoists are used in handling the timbers in the stopes.

MOHAVE COUNTY

(Special Correspondence.)—Bullion shipments from the Tom Reed-Gold Road district totaled about $160,000 during March, from 14,000 tons of ore. The foregoing figures are based upon the mine and mill outputs of the Tom Reed and Gold Road properties, supplemented by the reports of the mine superintendents of the camp in general.——During the fiscal year ended March 31, the Tom Reed Mining Co., the largest gold-producing property in Arizona, mined 48,000 tons of ore having an average value of $24 per ton. The bullion shipped during that period was $1,152,000, the gold content being approximately $1,136,000 and the silver $15,000. Dividends paid totaled $591,211, or 65% on a capital of 909,445 shares.

Oatman, March 1.

CALIFORNIA

AMADOR COUNTY

Drainage of the Hardenburg mine, four miles from Jackson, has been stopped, and it will be allowed to fill with water. All machinery is to be removed.

ELDORADO COUNTY

The Union mine, which has been closed for some years, has been purchased by J. Finch, of Spokane, who has started work in charge of H. H. Lang.

INYO COUNTY

Fifteen miners have started work at the Wilshire Bishop Creek mine, in charge of Jess Riley. E. W. Walter is superintendent. Four inches of snow fell on March 28.

NEVADA COUNTY

The W. P. & C. Mines Co. was incorporated last week with the following officers: president, Edgar S. De Goyler; vice-president, J. E. Miller; secretary, T. C. Cunningham; directors: K. G. Dunn, Eugene W. Kay of the California Extraction Co., and O. P. Posey, all of San Francisco. The company will unwater and re-open the West Point and California mines at Deadman's Flat, and the J. E. Miller claims adjoining.——Gravel-bars near Foote crossing on the middle Yuba river are being washed with good returns.——A new electric hoist at the Providence shaft of the North Star property has been installed and tested.——R. L. Hathaway, of Nevada City, has secured the contract to erect a 10-stamp mill at the Plumbago mine in Sierra county. Five or ten more stamps will be installed as development warrants.——It is purposed to consolidate the principal properties in the Washington district.

PLACER COUNTY

The Borealis company, near Newcastle, has a 15-ton mill at work and has sent a carload of concentrate to the Selby smelter. The plant is to be duplicated soon.

PLUMAS COUNTY

In a 1000-ft. adit driven at the Gold Leaf mine between Greenhorn and Squirrel creeks, 8 ft. of quartz has been cut showing rich ore.

SHASTA COUNTY

The Victor Power & Mining Co., at Harrison Gulch, is employing 75 men, in charge of R. D. Jackson. The cyanide plant yielded $2500 during the last two weeks. The new Lane mill is giving excellent results. A hydro-electric power-plant is to be erected on Cottonwood creek.——The Pittsburg Mt. Shasta Gold Mining Co. has developed a large body of copper ore in the Little Nellie mine, and a mill costing $100,000 is proposed for its treatment. The company has spent $500,000 to date.

SIERRA COUNTY

The Twenty-one and Rainbow companies have consolidated, and a 20-stamp mill will be built to replace the one burned two years ago.——At the Tightner about 100 men are employed, and the mill continues to crush ore. An incline-shaft is being sunk to test the ore in depth, and is down 800 ft. A. Hall is manager.

TUOLUMNE COUNTY

The Tarantula claims, north of the Eagle-Shawmut mine, were acquired on April 3 by ex-Governor Henry T. Gage for $12,000.——Rich ore has been cut in the McCormick mine, east of Jacksonville.

COLORADO

GILPIN COUNTY

In order to increase the capacity and recovery at the Iron City concentrating mill at Black Hawk, the manager, O. J. Duffield, will let a contract for overhauling and additions. It is expected that the plant will then treat 100 tons per day instead of 50 as at present.——The Bates Leasing Co., of Black Hawk, had a good settlement for 22 tons of ore from the Globe smelter.——Below the 1100-ft. level of the Old Town mine, in the Russell district, a shoot is yielding up to 3½ oz. gold per ton in the Most mill at Black Hawk.——The Lake mine, in Virginia cañon, is producing about $1000 per day.

GUNNISON COUNTY

Shipping ore has been opened in the Carlton-Victor adit at White Pine, after 700 ft. of driving was done.

LAKE COUNTY (LEADVILLE)

Pumps for the Downtown pumping scheme are expected at Leadville by the middle of April.——Rich gold specimens were extracted from the Mt. Champion mine last week, and added interest is being taken in the Lackawanna and Twin Lakes districts. A mill is to be erected at the Miller mine at an early date.——The Garbutt is shipping 50 tons of ounce gold ore daily, and it is probable that a mill will be built.——Lessees at the No. 1 Jonny have resumed shipping zinc carbonate.——The Connors lease at Jonny No. 2 is yielding a little high-grade gold ore, but the vein is very narrow.——Horrigan Bros. continue to produce a good tonnage of tailing from the old Adams mill. This work is carried on in connection with the operation of the Leadville district mill, near the Arkansas Valley smelter, where a flotation process is giving good results.

SAN JUAN COUNTY

There will be a good supply of ore for Silverton custom mills this season. One of the Silver Lake mill-bins contains 1000 tons, and at the Contention mill another bin is being built.

TELLER COUNTY (CRIPPLE CREEK)

The gold output of this district in March is estimated as follows:

Plant.	Tonnage.	Av. val.	Gross val.
Golden Cycle	29,000	$48.00	$1,392,000
Portland (Colorado City)	10,000	19.00	190,000
Smelters	5,200	55.00	286,000
Portland (Cripple Creek)	16,100	3.20	51,520
Stratton's Independence	9,668	2.97	28,714
Colburn-Ajax	4,300	6.70	28,810
Neville-Free Coinage	2,000	3.00	6,000
Kavanaugh-Jo Dandy	1,000	2.40	2,400
Wild Horse	350	3.00	1,050
Total	77,618		$1,986,494

The high average at the smelters and Golden Cycle was due to rich ore from the Cresson mine, which has yielded approximately $1,000,000 since last November. The district's yield for the first quarter of 1915 amounts to $4,954,039.

Prospecting by diamond-drilling in this district is suggested by Leo Von Rosenberg, who is examining several properties. ——In the Ward lease at 700 ft. at the Empire State shaft of the Isabella a high-grade streak has been cut. Other ore being stoped is 9 ft. wide.

IDAHO

Lemhi County

At the Pittsburg-Idaho mine at Gilmore, 30 lessees and 28 company men are at work. More leases are to be let in

BOHANNON DREDGE, NEAR SALMON, LEMHI COUNTY, IDAHO.

April. Some lessees are getting good returns from the ore extracted.

Shoshone County (Coeur d'Alene)

It is reported that a consolidation of all the companies in the Mullan copper belt is proposed, including the Snowstorm, National, Missoula, Lucky Calumet, Snowshoe, Copper King, and others, the holdings of the consolidated concerns to be operated under one management, and the entire district to be developed by extension of the lower workings of the National and Snowstorm.

There being plenty of water for hydraulicking on the north side, near Kellogg, placer miners started work last week.

The Hercules mine is reported to be earning $600,000 per month, the net yield in 1914 being approximately $3,000,000. ——Several underground improvements being completed in the Marsh mine, it is probable that mining will be resumed shortly. At the mill a 5 by 10-ft. tube-mill, seven additional concentrating tables, a flotation plant, and other accessories are to be installed, increasing the capacity from 150 to 200 tons per day. The better price for lead has been the cause of these improvements.——On April 3 the Bunker Hill & Sullivan company paid its regular monthly dividend, amounting to $81,750. The total to date is $16,037,250.

From one to two feet of ore that assays from 20 to 34% copper is showing in the face of the adit being driven on the Reindeer-Queen mine near Mullan. The face is now at a depth of about 900 ft. The ore is a clean chalcopyrite. ——Reports from the old Charles Dickens mine, now known as the Knickerbocker group, are to the effect that zinc ore is being sacked from the upper workings and prepared for shipment.——Plans to reorganize the Idora Hill Mining Co. were outlined at a special meeting of the stockholders in C. E. Mallette's office in Spokane last week, and the directors have been empowered to proceed as their judgment directs, having been given full authority to dispose of the Company's holdings and equipment to a new company.——Development work on the Samson, situated on the east fork of Eagle creek, near Wallace, which has been going on all winter, has accomplished gratifying results. The work is being done under contract to drive 300 ft. on the vein, the drift now being in about 1000 ft. During most of this distance there has been more or less ore continuously, and during the past few weeks the character and quantity of ore has shown marked improvement. The face of the adit now shows about 30 in. of good milling ore. The ore is a fine clean galena, picked samples of which are reported to assay 60% lead and 80 oz. of silver.——An important development has been made in the Ray-Jefferson mine, adjoining the Interstate-Callahan properties on Nine Mile, according to telegraphed reports from D. L. McGrath, superintendent, to E. E. Ellis, of Missoula, Montana, secretary-treasurer of the Company. The message states that 12 ft. of excellent concentrating ore has been cut in the No. 2 adit, 1400 ft. in and at a vertical depth of 800 ft., and that the vein had not been cut through. Driving east toward the Interstate-Callahan lines, 500 ft. distant, will begin at once, and the ore-shoot thoroughly explored. The property is equipped with a compressor plant, operated with current from the Washington Water Power Co.'s transmission lines, and a full complement of machine-drills, which will make rapid development possible.——J. H. Hoskins, of Coeur d'Alene, reports an interesting mineral discovery near Wolf Lodge and about two miles from Beauty bay, an arm of Coeur d'Alene lake. It consists of a well defined vein standing vertically between walls of granite and slate ranging from 4 to 20 ft. wide. The interesting part of this discovery is that the vein contains minerals heretofore rarely known in this part of the country, namely, tin and bismuth. The vein also shows numbers of small stringers of lead, and picked samples assay high in silver. Assays from the vein, Mr. Hoskins says, show 42% tin, 216 oz. silver, and $40 per ton bismuth.

MICHIGAN

Navigation on Lake Michigan, between Michigan and Indiana points, opened on March 20, two weeks in advance of the opening date last year.

MISSOURI

Jasper County

A 'Zinc and Lead Handbook,' compiled by L. L. Wittich, has been published by the *Joplin News Herald*. It covers 60 pages, and is in handy pocket form, 3¾ by 8½ in. A map of the Missouri-Kansas-Oklahoma fields occupies the two centre pages. Not only does the work deal with the local statistics, but covers the lead and zinc business of the world. Generally the publication is interesting and valuable.

The Granby Mining & Smelting Co. has proved by churn-drilling the existence of a large body of ore at a depth of 185 to 230 ft. in its land about 1½ miles south of the town of Granby, and will commence at once on the erection of a concentrating plant with a capacity of 1000 tons per 24 hours.

MONTANA

Madison County

The old Rochester district is to be resurrected, and the Watsecca and Gold Coin properties will be reopened when electric power is arranged for.

Missoula County

There appears to be renewed activity in the Saltese district, which is supplied by the Northern Pacific and Milwaukee railroads, especially at the Tarbox, Hemlock, Bryan, and Last Chance mines. The last has shipped a good deal of lead ore.

Silverbow County

On March 30 the High Ore and Diamond mines of the Anaconda company, which have been closed for nine months, were re-opened, and 1200 men will produce about 1200 tons of ore per day. The former property is the deepest in the Butte district, being down 3400 ft., while the Diamond is opened to 2800 ft. At the Great Falls smelter, in Cascade county, two blast and three reverberatory furnaces are being blown

in to produce first-class ore and concentrate from Butte and Anaconda.

Shareholders in the Bullwacker company are considering the resumption of mining in the glory-hole of the property in the spring. Lessees two years ago had satisfactory returns, shipping 30,000 tons of 4.07% copper ore. The mine contains a large tonnage of ore. The leaching plant is not to be operated.

The U. S. Bureau of Mines rescue-car No. 5, which has been at Butte since February 18, has left the district. In charge of J. L. Boardman it has given valuable instruction to miners and others.

NEVADA

Elko County

At Gold Circle the Elko Prince, Eastern Star, Esmeralda, Hardscrabble, and Rex are being operated full time. A 50-ton mill is working at the last named. The Elko Prince has a large tonnage of ore blocked out. A mill is to be erected at the Eastern Star.

Esmeralda County

A drift from the rise above shale 'A' level, 18 ft. below the 921-ft. level, of the Jumbo Extension, is showing seven feet of $75 ore.——The estimated production of the Goldfield Consolidated company in March is as follows: Ore mined, tons, 32,075; gross extraction, $367,000; operating expense, $195,000; and net realization, $172,000.

Eureka County

The Union Mines Co., operating 35 miles south of Palisade, has about 3000 tons of silver-lead ore ready for shipment, and expects to receive from $15 to $27 per ton net for it. The mine has been well developed by adits.

Lincoln County

The annual report of the Prince Consolidated Mining & Smelting Co. at Pioche states that the available resources amount to about $150,000. Development has proved a large tonnage of iron-manganese ore about 240 ft. wide. Tests made on the Bullionville and Dry Valley tailing show an average of $11.80 per ton, the dumps being worth $1,417,864 at present metal prices. A profit of $3 to $5 per ton should be made on treatment.

Mineral County

According to the general superintendent, L. H. Metzger, the Aurora mill will start early in April. It has been shut down for alterations to the filter-plant.

Nye County (Tonopah)

During the week ended April 3, eight mines at Tonopah produced 10,117 tons of ore valued at $208,066.——A drum on the electric hoist of the Belmont broke last week, reducing the output. The Favorite vein is opening well at 1000 ft.——Rich ore is still being developed on No. 5 level of the California claim of the West End.——During March the Extension mill averaged 243 tons per day.——Considerable development is in progress in the Tonopah Mining Co.'s Sand Grass claim.

White Pine County

After being closed since 1907, the Ruth mine has been reopened by the Nevada Consolidated company. Mining will be in charge of William Spencer and William Caulfield, who have had experience with the Utah Copper Co. A 2500-kw. turbo-generator and other machinery is to be installed at the power-plant at McGill. A new reverberatory furnace has been blown in.

OREGON

Baker County

A stage-coach containing bullion worth $7000, traveling from the Rainbow mine to Durkee, was held-up by bandits near Rye Valley on April 5. The metal was on its way to the San Francisco mint.

Malheur County

In furtherance of the federal government's search throughout the United States for supplies of potash and nitrates, the recently discovered nitrate field near Homedale, Idaho, was visited by a representative of the Geological Survey in November 1914. The field lies in and about the valley of Sucker creek, near the state line, and about 16 miles southwest of Homedale. A number of prospects were visited and samples were collected for analysis. Two general classes of deposits were recognized, namely: (1) crevice and cave deposits in the lavas bordering Sucker creek, and (2) more or less bedded deposits in low rounded hills composed of sedimentary materials.

SOUTH DAKOTA

Lawrence County

(Special Correspondence.)—When the Black Moon mill of the Mogul company was completed a year ago the corporation had a floating indebtedness of considerable amount and owed some back taxes. In the year just closed the debt was all liquidated, some $7000 of taxes paid, and a good working fund established in the treasury. Of course in the space of a year it has been possible to get everything about the mill in good condition, and this has been reflected in a gradually increasing tonnage. During the first half of March the mill handled 120 tons per day. Previous to this the best average for a month was 100 tons per day. This tonnage brings the capacity up to nearly the maximum which can be put through the Dorr slime agitators. This will be remedied by the immediate installation of another agitator, so that the crushing department can be pushed to its full capacity, which will probably be found to be about 150 tons. It now appears that the Company is getting on a good financial basis. Interest on its $240,000 worth of 6% bonds amounts to $14,000 per annum, equivalent to $1200 per month, a sum that the property should be earning at the present time. The mine is in better physical condition than it has been for several years, with a good supply of ore in sight, and facilities at hand for economical operation.

Work at the Rattlesnake Jack mine, at Galena, is at present confined to shaft sinking, and it is understood that no further construction work will be undertaken at the mill until warmer weather. The mill is very nearly completed; a few weeks' work will put it in shape to operate.

Deadwood, March 15.

Pennington County

The 50-ton capacity mill near Hill City, which has been reconstructed by Robert McNish and associates, is ready to crush the 500 tons of tin-bearing ore on hand from a mine near the Etta. It is hoped to work the plant continuously.

UTAH

Juab County

Ore shipments from the Tintic district last week totaled 102 cars. About 200 tons of residue per day is to be sent from the old Sioux or Farrell mill at Mammoth to the A. S. & R. smelter near Salt Lake City. The dump contains between 30,000 and 50,000 tons of $7 silicious material needed at the smelter.——In March the Iron Blossom mine produced 150 tons of 36% zinc ore.

Summit County

The following dividends were paid last week at Park City: Daly-Judge, $45,000; Silver King Coalition, $187,500; and Silver King Consolidated, $62,500.——In December, 1913, the Daly West mill was destroyed by fire, a new one was erected, and it is now working at normal capacity. The mine and

plant employs 125 men. Most of the ore is coming from 1700 and 2000 ft. The general manager, H. G. McMillan, states that lessees are working above the 1200-ft. level.——The Snake Creek drainage tunnel is in approximately 11,000 feet.

WASHINGTON

Ferry County

(Special Correspondence.)—The Republic Consolidated Mines Corporation, as the owner of an option on the Lone Pine, Pearl, and Surprise mines, at Republic, has sold the option to H. A. Sell, one of a West Virginia syndicate, for $50,000, under certain conditions. Thirty miners are now employed.——The North Washington Power & Reduction Co.'s cyanide mill has been sold by W. W. Tolman, receiver of the Company, to F. R. Clark, of Spokane, Washington, for $25,000. The contract of sale has been approved by the superior court. The contract calls for the equipment of the mill for a capacity of not less than 100 tons per day.

Republic, March 20.

(Special Correspondence.)—The West Virginia Mining Co., with a capital of $1,000,000, has been incorporated, with Republic as the principal place of business and J. O. Jarrel, H. A. Sell, and John Benson as trustees. Mr. Jarrel is from West Virginia, Mr. Sell from Colorado, and Mr. Benson from Republic. The Company has taken over the Lone Pine, Pearl, and Surprise mines, at Republic. Mr. Benson will be superintendent of the Surprise, and Thomas Ferguson will have charge of the Lone Pine and Pearl mines.

The miners, creditors of the Western Union mine, have received 10% of their claims from the sale of garnisheed bullion. Another dividend is expected soon from the sale of ore at the smelters.

Republic, March 26.

CANADA

Alberta

(Special Correspondence.)—It is estimated that the Alberta Petroleum Consolidated Co.'s No. 2 oil-well will yield 100 bbl. per day, and a test is to be made to prove its capacity. The oil has a gravity of 37.7° Baumé.——The Western Pacific well makes 50 bbl. per day, and tests 48°.——The Moose oil tested 39°.——The Dome people, at 2200 ft., have finished their 'fishing' troubles, and expect oil within 50 ft.——The Prudential is drilling again, after its fire.——The Northwestern Pacific, at 2250 ft., is regarded favorably.——At 3120 ft. the Mowbray-Berkley well is reported to be in the Dakota sands.——At the Gratton, east of Edmonton, the well, in the last week of March, was down 607 ft., and there was trouble with water. Gas is coming out all the time, and a big 'gasser' is likely, with good oil-producing horizon lower down.——The Sweet Grass area, southeast of Calgary, is receiving considerable attention lately, but no well is producing so far.——Another share boom has started on the exchanges, but the professional nature of this move is plainly seen. Enough depth will be reached within 60 days in several wells to give an approximate valuation of the field.

Calgary, March 31.

British Columbia

The Hedley Gold Mining Co. in 1914 earned a net profit of $388,228 from 78,494 tons of ore averaging $10.80 per ton. The property is stated to have more ore in reserve now than ever before.——The Le Roi No. 2 company is paying a dividend of 24c. per share. Ernest Levy, the general manager, recently returned from England.

Ontario

During the 28 days ended February 25 the Hollinger mine produced 22,438 tons averaging $11.39 per ton, returning a profit of $154,714. The monthly dividend calls for $120,000, so there was a surplus of $34,714, and total surplus of $1,192,000. Working costs averaged $3.98 per ton.

PERSONAL

B. B. Thayer is at Butte.

Pope Yeatman is at Chuquicamata, in Chile.

W. DeL. Benedict is returning to New York.

A. G. McGregor was at Douglas, Arizona, recently.

Joseph W. Boyle has gone from Dawson to London.

Leo Von Rosenberg, of New York, is at Cripple Creek.

W. A. Dickey, of Landlock, Alaska, is here on a visit.

John Hoy, of Butte, Montana, is visiting the Exposition.

E. M. Rogers, of New York, has been visiting the Exposition.

W. A. Prichard has gone to London, on his way back to Colombia.

H. W. Gepp, of Broken Hill, has passed through New York on his way to London.

D. C. Jackling was married to Miss Virginia Jolliffe at San Francisco on April 5.

J. P. Charra is at Goldfield, examining mines in the interest of French investors.

John M. Nicol has had to leave Mexico, like many others, and is now in San Francisco.

Seeley W. Mudd and Philip Wiseman passed through San Francisco on their way northward.

E. P. Mathewson, recently in the hospital at Montreal, has returned convalescent to Anaconda.

Sherwood Aldrich, who has been spending a holiday in San Francisco, has returned to Colorado Springs.

G. T. Jackson has been promoted from superintendent to assistant manager of the Perseverance mine, near Juneau.

B. B. Neiding, formerly superintendent of the Kensington mine, has been appointed to a similar position at the Perseverance mine, near Juneau.

Harris J. Ryan has been elected honorary vice-president of the American Institute of Electrical Engineers, and he will act as a special honorary representative and officer of the Institute on the Pacific coast during the Panama-Pacific Exposition.

SCHOOLS AND SOCIETIES

The American Mining Congress is forming a branch in Utah, with headquarters at Salt Lake City, as it has done in Arizona and Montana recently, to further the objects of the society.

The South African Institution of Electrical Engineers held its annual meeting in Johannesburg during the second week of January. The total membership is 236, and receipts in 1914 amounted to $3300.

The Chamber of Mines and Oil of Los Angeles has a membership of about 260 mining and oil companies, individual operators and others. In 1914 there were 79 new members added. The total debt is only $150.

The *Official Register* of Princeton University for January 7 makes announcement for 1915-16 in the department of geology. This includes undergraduate, honors, and graduate courses, laboratories, museum, higher degrees, fellowships, and the graduate college.

The Electrical Association of Australia has recently been formed as the result of a conference between the electrical societies of Victoria and New South Wales, which are representative of practically the whole profession in those states. Other state's institutions will be admitted later on. O. W. Brain, chief electrical engineer of the New South Wales railways and tramways, is president.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, April 8.

Antimony	25 —25¾
Electrolytic copper	15½ 15¾
Pig lead	4.40— 5.35
Quicksilver (flask)	$80.00
Spelter	10¾ —11
Tin	40 —41½
Zinc-dust, 100-kg. zinc-lined cases	15

No changes are recorded in the local metal market.

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, April 8. The market may be summarized by saying that all metals are firm.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending	
Apr.	1 50.00	Feb. 24	48.70
"	2 49.87	Mch. 3	49.02

May	58.21	....	Nov.	49.12	....
June	56.43	....	Dec.	49.27	....

This week's average is a trifle lower than in the previous week, but the market is steady. On April 3 about 120,000 oz. was shipped from San Francisco to the Orient.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Mch. 10	80.00	Mch. 24	80.00
" 17	80.00	" 31	80.00

May	33.29	....	Nov.	33.51	....
June	30.72	....	Dec.	33.60	....

Tin on April 7 was quoted at 47c. per pound in New York, and £168 per ton in London.——In their monthly circular on tin, dated April 2, L. Vogelstein & Co. states that Straits shipments for eight months of the War totaled 40,329 tons, against 42,855 tons in the same period of the previous year, therefore they are normal. On the whole, it would appear that a sufficient supply will be forthcoming for this country.——The output of the Malay States in 1914 was 109,854,533 lb., a decrease of 2,129,333 lb. The year was discouraging, small mines were closed, 25% of the coolies were repatriated, and the Government averted a crisis by advancing on the output. Shipments to the United States were 22,032,267 lb., compared with 26,222,133 lb. in 1913. A consular cablegram of April 1 states that the tin situation at Singapore is improving, and the principal shippers are securing special permits for American orders.

COPPER

Prices of electrolytic in New York, in cents per pound.

Date.		Average week ending	
Apr.	1 15.63	Feb. 24	14.42

Apr.	4.98	....	Oct.	4.75	....
May	4.91	....	Nov.	5.01	....
June	4.84	....	Dec.	5.40	....

The spelter market still shows erratic movements, and is the subject of considerable discussion. In the Missouri-Kansas-Oklahoma region prices for zinc-blende continued to decline, the highest being $60 per ton down to $48 for the basis of 60% metal. The spelter market quotations were further complicated by the decision of the Merchants' Exchange of St. Louis to stop giving any to the Associated Press, because those that were given to the exchange by the brokerage firms were unreliable, according to the 'Joplin Globe.' As the New York market has not reported any specific price of spelter for two weeks, the only actual market figure generally available is London, which is reported firm at £43 per ton, or 9.2c. per pound. There are sales of spelter in New York and St. Louis, of course, but the actual selling figures have been badly confused with bids and offers to sell, which it is commonly known are the result of attempts to manipulate the market, either up or down. The Butte & Superior mill treated 41,710 tons of ore in March, which would yield about 13,500,000 lb. of spelter.

COMPANY REPORTS

NEW IDRIA QUICKSILVER MINING COMPANY

The report of this California quicksilver company is of interest, as the market for the metal has been considerably discussed during the past six months. Operations in 1914 resulted as follows:

	1914	1913.	1912.
Development, feet	12,367	9,182	11,080
Ore treated, tons	62,578	76,993	76,348
Quicksilver recovered, flasks	6,550	9,700	9,600
Average net price per flask	$41	.....	.....
Total revenue	$295,361	$363,054	$377,484
Operating expenses	340,371	298,041	303,721
Loss	45,010	*65,013	*73,763
Dividends	10,000	40,000	120,000
Previous surplus	144,600	119,587	165,824
Surplus carried forward	89,590	144,600	119,587

*Profit.

Storms involved the expenditure of about $20,000 in repairing the property and roads, and extraordinary development and lower-grade ore all contributed to the decreased earnings. The known orebodies have been nearly depleted above No. 7 level. Development was principally done on No. 9 and 10 levels, which produce most of the ore. The Molino adit, to develop the San Carlos deposits, is in 3900 ft. and is under them. A rise is being driven. The price of quicksilver up to August was $36 per flask. After the war started, it advanced to $75, at which price it was possible only to make small sales. The year's average was $41 per flask.

SENECA—SUPERIOR SILVER MINES, LTD.

The third annual report of this Cobalt, Ontario, company covers the year 1914. The president, S. Harry Worth; consulting engineer, W. E. Legsworth; and manager, R. H. Lyman, make the following remarks in part:

In spite of the decrease in the price of silver, the profit was greater than in 1913. It is the policy of the directors to sell the metal at current prices rather than hold for a rise, thus securing a larger profit than otherwise.

Development amounted to 3445 ft., 1004 ft. less than in the previous year, work being reduced to a minimum in August on account of the war. The Worth vein has been opened on four levels. On No. 3 level the ore-shoot is 400 ft. long, and 280 ft. on No. 4. Ore reserves are estimated to contain 2,035,000 oz. The ore-dressing plant is now a very complete mill, and is equipped to make a complete concentration of all fine material from the picking-table, and the final mill tailing is down to 5 oz. per ton. The shipping product of high-grade jig and table concentrates goes to the Deloro smelter. Additions to the plant consisted of a 4 by 8-in. Sturtevant crusher, 4½ ft. by 16-in. Hardinge ball-mill, a double jig and trommel, and another Deister sand and Deister slime-table. Shipments, the product of 16,871 tons mined, totaled 525 tons, and the production was 1,430,674 oz. silver worth $758,581. The cost was 30.53c. per ounce. The total profit amounted to $321,742, to which is added the previous balance of $85,290. Dividends absorbed $335,219, and the balance carried to 1914 is $71,814.

AMERICAN SMELTING & REFINING COMPANY

According to Daniel Guggenheim, president of this great concern, notwithstanding the demoralized business of 1914, and particularly the fact that the Company's large business in Mexico was not at all profitable, and the low prices of metals, due to the war, resulted in the cutting off of a large supply from the mines, yet, with all these discouragements, the net earnings of the Company were $10,571,915, or only about $700,000 less than the preceding year. The total turnover amounted to over $200,000,000, on which the net earnings were nearly 4½ per cent.

The policy of the Company is to make the smelting and refining charges low in order to encourage the supply of ores, and in the endeavor to offset these low charges the Company is mining coal, producing coke, owning and operating mines producing gold, silver, lead, copper, and zinc, and is now erecting plants for the refining and production of other metals, such as nickel, platinum, palladium, arsenic, bismuth, cadmium, tellurium, and selenium. The Company also produces sulphuric acid and sulphate of copper. The Company is also taking up the manufacture of metal products, and last year produced over 40,000,000 lb. of manufactured material. In connection with the large growth of the Company in refining copper, in 1908 the annual production of copper was approximately 50,000,000 lb., while last year the Company refined about 530,000,000 lb. Considerable attention is being paid to the welfare of employees, including accident prevention, hours, and pensions. The pension fund amounts to $520,238.

Financial results may be summarized as follows:

	1914.	1913.
Net earnings of operating properties	$11,603,015	$12,111,407
Other income	1,222,514	1,318,526
Total income	$12,825,529	$13,429,933
Total charges	3,793,964	3,673,393
Dividends paid:		
A. S. & R. preferred	3,500,000	3,500,000
A. S. & R. preferred 'A'	1,017,450	1,020,000
A. S. & R. preferred 'B'	1,500,000	1,500,000
A. S. & R. common	2,000,000	2,000,000
Total dividends	$ 8,017,450	$ 8,020,000
Surplus for year	1,014,115	1,736,540
Total surplus	$19,510,057	$18,495,942

Assets, which amounted to $188,577,237, include ore, bullion, and products on hand and in transit worth $24,660,942; cash, $8,034,778; and material and supplies, $2,785,635.

CALUMET & ARIZONA MINING COMPANY
SUPERIOR & PITTSBURG COPPER COMPANY

These companies operate at Warren, Cochise county, Arizona, the latter controlled by the former, which also controls the New Cornelia Copper Co. and other subsidiaries. The general manager, John C. Greenway, includes the following in his reports for 1914:

Development in the C. & A. amounted to 6328 ft., against 15,635 ft. in 1913. Only a little work was done at 1350 ft. in the Irish Mag shaft. Up to the time of curtailment in August, considerable sulphide ore was opened at 1250 ft. in the Oliver shaft. Results were not encouraging at 400 ft. in the Powell shaft. The recently acquired Higgins or Magenta ground was entered in November at 1000 ft. from the Cole area. The ore output was 66,467 tons.

Development in the S. & P. ground totaled 66,465 ft., compared with 47,201 ft. in 1913. The large body of oxide ore at 900 ft. in the Granville claim was blocked out and extensively mined. At 1000 ft., 50 ft. of sulphide and a good deal of oxide ore was found, being a continuation of the Granville shoot. A large tonnage of 2% ore was proved at 1300, 1400, and 1500 ft. in the Baton Rouge claim. The pump-station was completed at 1800 ft. in the Junction shaft and levels below 1500 ft. are to be developed. A total of 1,521,742,827 gal. of water was pumped. Work at the Junction has shown great tonnages of 2 to 4% ore. The motor-haulage system connecting

the Briggs, Hoatson, and Junction shafts was completed. Ore production amounted to 505,011 tons.

Low-grade sulphide ore, 25,491 tons, with high sulphur and iron content was sent from the various properties to the El Paso smelter, this ore being desired there, and a corresponding premium is paid. Ore reserves in the mines increased by 556,427 tons.

The smelter treated the following: C. & A., 64,702 tons; S. & P., 465,349 tons; and custom ore, 138,726 tons; a total of 668,776 tons. The blast-furnaces reduced 403,269 tons of ore and 31,299 tons of slag, etc. The reverberatories treated 171,500 tons of calcines, 43,485 tons of fettling ore, 19,297 tons of flue-dust, and 3813 tons of flux. The roasting furnaces treated 209,138 tons of ore, reducing 27.5% sulphur to 9%. The converters produced 32,059 tons of blister copper. Metal from Company ores totaled 49,992,909 lb. copper, 573,606 oz. silver, and 19,745 oz. gold.

The income amounted to $8,518,999; expenses, $3,085,535; and dividends, $1,851,009. In spite of the 50% reduction in output for five months, mining costs dropped 53c. and smelting 35c. per ton.

Concerning the Ajo property of the New Cornelia Copper Co., which contains over 40,000,000 tons of oxide and sulphide ore, the president, Charles Briggs, said: "If future results continue to equal those which we have already obtained, a plant with a daily capacity of 4000 tons of ore will be designed. Plans for financing have not been completed." As to the leaching process, J. C. Greenway, general manager, said: "After extensive laboratory work at Douglas, which gave promise, we erected a substantial crushing plant, consisting of jaw-crusher, Symons coarse crusher, Symons fine crusher, screens, etc., at Ajo, and installed a one-ton plant for actual trial in the field. This one-ton plant has been operated practically six months. For the past 74 days the plant has given an extraction of 80.87% for the total copper contained. Iron and other deleterious salts in the solution have been controlled to the point that a yield of 0.982 lb. of copper per kilowatt-hour has been obtained in the electrolytic plant. All the acid needed has been regenerated from the solution itself excepting a deficiency of approximately 1.4 lb. 100% acid per pound of copper. A 40-ton plant has been completed and is now in operation. We feel that the process has been worked out and that any changes in the future will be in detail only."

It is thought that ample water for all purposes has been found in the well drilled near the property.

CROWN RESERVE MINING CO., LTD.
PORCUPINE-CROWN MINES, LTD.

These two companies are taken together, as the first-named controls the other, one operating at Cobalt, and the other at Porcupine, Ontario. The report covers the calendar year 1914.

Crown Reserve.—The general manager, Samuel W. Cohen, makes an interesting statement regarding operations. Development amounted to 4056 ft., making 26,199 ft. to date, 469,552 cu. ft. of stoping, and 40,842 tons of ore broken. Eleven veins contributed to the total output of 1,425,320 oz. of silver. The Carson No. 1 is worked out as far as high-grade ore is concerned. In Gear No. 14 there is still a fair tonnage of rich ore in patches with the milling ore. No. 17 produced 620,000 oz., that part of the east end of the vein was taken out right up to the bottom of Kerr lake. Drainage of the lake was carried on successfully, although mud and clay interfered with pumping. Over 600,000,000 gal. of mud and water have been pumped, leaving probably 100,000,000 gal. more to be removed. Work by the Kerr Lake company in the bed of the lake shows several veins running into the Crown Reserve ground. The drainage enabled ore extraction from No. 17 and 24 veins, the latter producing 420,000 oz., which could not have been done otherwise and the output would have fallen off. Drainage of this lake was described in the *Press* of January 9, 1915. The value of No. 28 is erratic, but there is an appreciable amount of ore above the 150-ft. level. On the 200-ft. level, a shoot 190 ft. long has been opened on No. 30, there being 1 in. of high-grade and 48 in. of mill ore. Vein 33 was cut in Keewatin formation at 200 ft., and shows 1 in. of calcite with a little silver. Ore reserves contain about 1,500,000 oz. On the Silver Leaf property 800 ft. of work was accomplished, and while exploration at 500 ft. was unproductive, in the old workings at 75 ft. a 1-in. vein was cut between the conglomerate and slate, and has been opened 25 ft., yielding 1000-oz. ore. In the Drummond Fraction, jointly owned with the Kerr Lake company, No. 1 vein yielded 116,667 oz., netting $12,210 for each company.

Ore production was as follows: high-grade, 288 tons containing 920,994 oz., and mill ore, 31,347 tons yielding 467,757 oz., a total of 1,425,320 oz. valued at $740,093. Costs totaled 28.95c. per ounce. The output to date is 8678 tons yielding 18,429,141 ounces.

Financial results were as follows: Operating profit, $239,477; dividend from Porcupine-Crown company, $144,000; interest, $3832; and balance from 1913, $844,616, making a total of $1,231,925. From this, dividends amounting to $424,515 were paid, and after paying for prospecting, legal, and other expenses, the surplus at the end of 1914 was $771,711.

DRAINAGE OF KERR LAKE, COBALT; WASHING DOWN THE MUD.

Porcupine-Crown.—This property is managed by M. W. Summerhayes. Development totaled 4633 ft. during 1914, making 10,555 ft. to date, and results were most satisfactory. On the 100-ft. level the ore-shoot has been opened for 465 ft., 705 ft. at 200 ft., 979 ft. at 300 ft., and 700 ft. at 400 ft. On the latter level there is about 270 ft. of barren rock between the two shoots. At 500 ft. the vein was driven on for 65 ft., when the main fault was found, similar to conditions at 300 ft., but the fault problem was satisfactorily solved. A diamond-drill hole was put down near the eastern boundary, and 900 ft. south of the northern boundry. At 275 ft. 18 in. of $4 ore was cut, and at 1100 ft. about 20 ft. of formation of low-grade. Ore reserves are estimated at 85,000 tons worth $1,510,000, which is correct within 10 per cent.

The mill, which was described in the *Press* of July 18, 1915, treated 40,857 tons of $17.18 ore with 97.26% recovery. The revenue from bullion was $691,394, and operating profit $305,075. Adding balance from 1913 and sundry revenue, there was $457,979 available, from which $240,000 was distributed in four dividends and $5855 as bonus to employees, leaving a surplus of $212,124.

MINING DECISIONS

Mining Terms—Limited Application

A statute imposing a penalty for leaving unguarded a shaft, drift, or cut, within any town limits, refers only to mining excavations and cannot be applied to an unguarded sewer trench.

McLaughlin *v.* Barsden (Montana), 145 Pacific, 954. January 18, 1915.

Assessment Work—Delinquent Co-owners

In course of one of the many conflicts over the title to the valuable potash deposits in San Bernardino county, California, a temporary injunction has been granted restraining certain locators from claiming a forfeiture against their co-locators for failure to contribute to the performance of annual assessment work as required by law, where it appears from the bill that said co-locators had attempted to perform such work but had been prevented by force from so doing, and that to record such claim of forfeiture would cloud said co-locator's title to the claims.

Thompson *v.* Pack (California), 219 Federal, 624. December 10, 1914.

New Law Governing Phosphate Deposits

"Where public lands containing deposits of phosphate rock have heretofore been located in good faith under the placer mining laws of the United States and upon which assessment work has been annually performed, such locations shall be valid and may be perfected under the provisions of said placer-mining laws, and patents whether heretofore or hereafter issued thereon shall give title to and possession of such deposits: Provided, that this act shall not apply to any locations made subsequent to the withdrawal of such lands from location, nor shall it apply to lands included in an adverse or conflicting lode location unless such adverse or conflicting location is abandoned."

Act of Congress, approved January 11, 1915.

The Oil Withdrawal Case

In 1909, ex-president W. H. Taft made a temporary withdrawal by executive order of oil lands in California and Wyoming. Some months later prospectors entered on a portion of the withdrawn area, made locations thereon, and proceeded to extract large quantities of oil. Suit was brought by the United States authorities seeking to recover the land and to obtain an accounting for the 50,000 bbl. of oil alleged to have been illegally obtained. The District Court sustained a demurrer to the bill and dismissed it on the grounds that the President had no right to withdraw the lands in question without authorization from Congress. The case went to the United States Supreme Court on certiorari. In a lengthy opinion, delivered by Justice Lamar, and dissented from by Justices Day, McKenna, and Van Devanter, the Supreme Court reversed the judgment of dismissal on the principal grounds that, by years of acquiescence in executive withdrawal orders, Congress had impliedly conferred on the President the right to make such withdrawals, when in his opinion they were necessary for public purposes, until such time as Congress can act upon the matter.

United States *v.* Midwest Oil Co. (U. S. Supreme Court). Decided February 22, 1915.

[Note.—Readers wishing to obtain copies of this opinion in full in advance of its general publication in the reports, will find it printed in the San Francisco *Recorder* for March 15, 1915.]

BOOK REVIEWS

Methods in Metallurgical Analysis. By Charles H. White. P. 356. Ill., index. D. Van Nostrand Co., New York, 1915. For sale by the *Mining and Scientific Press*. Price, $2.50.

This volume adds to the already large number of books on metallurgical analysis, but the author, who is assistant professor of mining and metallurgy at Harvard and the Massachusetts Institute of Technology, states that he has brought together those methods which, owing to their fitness, seem to have been most generally adopted in American metallurgical laboratories. From several years' experience he finds that students who have had adequate preparation in qualitative analysis can take up metallurgical analysis at once, without having previously taken a general course in quantitative analysis. The first 45 pages of the work discuss the equipment of a 'lab,' selection of methods, sampling methods and apparatus, and operations in analyses in a thoroughly practical manner. Then follow chapters giving simple and quick methods of analysis of ore. The estimation of sulphur, silicon, phosphorus, manganese, nickel, copper, tungsten, and other metals, and gases, in steel, covers 53 pages, and may be said to be an important part of the book. Determinations are given of furnace products, gold and silver, fuels, oil, and some of the minor and rarer metals. Numbers of useful tables find their place as in most works of this kind. To show that it is up to date, it is only necessary to mention that such subjects as copper in steel, cyanogen in commercial cyanide, gas analysis, testing of uranium ore, and examination of boiler water are among the many given adequate space.

A Text-Book of Practical Assaying. By James Park. P. 342. Ill., index. Charles Griffin & Co., London; J. B. Lippincott Co., Philadelphia, 1914. For sale by the *Mining and Scientific Press*. Price, $2.50.

In 1894, the reviewer of this work, which is the first edition published in England, and revised and enlarged from the third New Zealand edition, studied pratical assaying, certain chemistry, and the cyanide process from the first copies printed at the Thames, New Zealand. Since then the cyanide portion of the book has been published in a separate volume, and the new one to hand has a much greater scope, covering both dry and wet methods of assaying in considerable detail. The author, who is professor of mining and geology at the University of Otago, Dunedin, New Zealand, originally prepared the notes for students, the matter covering a two years' course in assaying. The idea of the arrangement of the text has been to lead the student from the relatively simple operations necessary in the assay of gold and silver ores up to the determinations that pass insensibly into the quantitative analysis of simple and complex substances; and through imparting manipulative practice and a knowledge of first principles to initiate the student into the technical methods of ore valuation. Following this system, we find in the estimation of value of certain ores the dry assays are described, followed by the gravimetric and volumetric methods. For other ores and minerals only wet analyses are possible, these also being given. Any person with a small knowledge of certain reagents and materials could learn assaying from this book without trouble, owing to its practical style. In addition to ore determinations, there are methods for the estimation of rare earths, chlorine, sulphur, cyanides, lime, cement, coal, soils, fertilizers, oil shale, water, cyanide tests, and slag.

Bulletin 69, 'Petroleum Industry of California,' has just been printed, and is ready for distribution by the Mining Bureau.

New Machines and Devices

Information based on letters and catalogues from manufacturers, and staff observations.

Ore Treatment Apparatus at the Exposition

In the Palace of Machinery at the Panama-Pacific Exposition the Kelly Filter Press Co., of Salt Lake City, Utah, has a simple yet interesting exhibit explaining its apparatus for filtering slime. It consists of a standard size filter-press, the leaves of which are moved in and out of the cylinder by motor-driven gear, showing how they are run out for discharging residue, and then returned for the formation of new cakes. A small model press is in actual operation filtering and discharging slime, and may be inspected by visitors. A motor-driven vacuum-pump is part of the necessary equipment.

Commercial Paragraphs

The Dorr Cyanide Machinery Co. announces that after May, 1915, the address of its New York office will be room 2843, Whitehall building, New York, instead of 30 Church street, as heretofore.

The *Labor Saver*, the Stephens-Adamson Manufacturing Co., of Aurora, Illinois, monthly, for March contains interesting illustrated notes on ore handling in modern milling-plants (a reprint), freight-handling, coal-moving equipment, and the 'S-A' belt-conveyor removing gravel overburden from a clay bank.

The Terry Steam Turbine Co., of Hartford, Connecticut, announces that after March 22 the Chicago office of the Company will be in charge of A. W. de Revere, in the Peoples Gas building. An office has been opened in the Michigan Trust building, Grand Rapids, Michigan, in charge of A. L. Searles, to cover the southern peninsula of Michigan.

In *Bulletin* No. 40 the Cement-Gun Co., of Church street, New York, discusses the protection of steel with gunite without reinforcing. This was accomplished in protecting the steel sub-structure of the Cortlandt Street ferry-terminal of the Pennsylvania line, New York, from corrosion and rust, by a thin coating of gunite, applied without reinforcing. The steel was first sand-blasted to gray metal, and then coated to a thickness of ¼ to ½ inch. After four months no signs of cracking are visible.

Bulletin No. 46,251 of the General Electric Co. of Schenectady, New York, covers outdoor metering outfits. Power companies operating high-voltage transmission lines have found in many cases that a watt-hour meter and transformer outfit, combined in a unit and adapted for outdoor service, can be used to great advantage both from the standpoint of initial cost and of maintenance where it is not advisable to build a complete substation. The outfits described in this bulletin have been designed especially for this service and are offered as reliable, accurate, and compact units for outdoor metering service. They are admirably adapted for use in outdoor substations for measuring the amount of power supplied to the various feeders. Feeders are often run directly from a transmission line at intermediate points, the voltage of feeders and transmission line being the same. In such instances, these outdoor metering outfits furnish the most satisfactory method of measuring the amount of power supplied to each feeder.

In 'Conglomerate Ore,' *Bulletin* No. 112, the Williams Patent Crusher & Pulverizer Co., of St. Louis, Missouri, gives some details of the crushing-machines it manufactures. In the chain-hammer trommel-mill a central shaft has attached, by chains, a number of hammers weighing from 14 to 40 lb., and revolves at about 500 r.p.m. Outside of the swinging-hammers is a revolving trommel, 20 to 72 r.p.m., composed of bars spaced according to the size of the desired product. Ore up to 8 or 10-in. size is fed into the machine, and reduced. In the conglomerate mill the beaters weigh 14½ lb. each, and the total weight of the No. 1 crusher is 8500 lb., and No. 6 is 16,000 lb. The makers state that these machines are satisfactory in place of stamps or coarse rolls for first crushing, also as a preliminary crusher before Chilean mills, Hardinge mills, ball or tube-mills, stamps or rolls. Specifications are given of the 1915 models, also some letters from users.

The Traylor Engineering & Manufacturing Co. of Allentown, Pennsylvania, reports the following orders closed in the past two months. Conklin & Foss Co., who have the largest trap-rock quarry in the United States, purchased the largest jaw-crusher ever manufactured. This crusher is 66 by 86 in., weighs 520,000 lb., constructed of cast-steel throughout and manganese-steel fitted. The crusher will be driven by a Westinghouse M. S. 350-hp. motor. Twenty all-steel, 10-ton cars, to be used for transporting the stone from the quarry to the large crusher. These cars are of rigid design without any dumping apparatus. One set of heavy-duty type 'AA' rolls, 42 in. diameter by 16-in. face, for the Washington Asphalt Block & Tile Co. One 24 by 118-in. special furnace for the General Chemical Co. A carload of water-jackets for the Tennessee Copper Co. The Phelps-Dodge company ordered water-jackets for its Detroit copper-plant. The Interstate-Callahan Mining Co., near Wallace, Idaho, will add two sets of Traylor rolls, 30-in. diameter by 14-in. face, fitted with the improved design of side adjusting mechanism. The Consolidated Mining & Smelting Co., of British Columbia, ordered an improved short-length tube-mill, 6 ft. diameter, and five improved Traylor all-steel jigs. A 56 by 360-in. furnace for the Granby Consolidated company at Anyox, British Columbia. Thirty water-jackets for copper-smelting furnace for the Consolidated Mining & Smelting Co., Ltd., of Trail, British Columbia. A heavy Blake crusher, with jaw opening 18 by 30 in., for the General Chemical Co. The Balbach Smelting & Refining Co. has purchased a complete set of water-jackets for its lead furnace. The Boyd-Smith Mines, of Virginia, has placed an order for a set of Traylor automatic adjusted rolls, 24 in. diameter by 12-in. face. These rolls are of the same design as furnished to the Sulphur Mining & Railroad Co., which adjoins the Boyd-Smith Mines. The Tennessee Copper Co. purchased a 56 by 270-in. furnace, of special construction, fitted with cast-iron superstructure, and a 24 by 48-in. heavy-duty crusher. The Foster Paving Block Co. has purchased a No. 6 gyratory-crusher plant, complete, including elevator, feeders, gates, etc. Among some of the recent orders received from the lead district of Missouri is three sets of 42 by 18-in. extra heavy type 'AA' crushing rolls for the St. Louis Smelting & Refining Co.; one 30 by 60-in. heavy-duty Blake crusher for the same people; also a 30 by 60-in. heavy-duty crusher for the Mine La Motte Co. The Irvington Smelting & Refining Co., at Irvington, New Jersey, recently purchased a crushing-plant for handling matte which consisted of a 10 by 16-in. Blake crusher, screen, elevator, and a set of 24 by 12-in. type 'A' automatic adjusted rolls. The St. Louis Smelting & Refining Co. also purchased a 36 by 126-in. new lead blast-furnace.

Edited by T. A. RICKARD

Volume 110 SAN FRANCISCO, APRIL 17, 1915 Number 16

YESTERDAY — TODAY

San Francisco celebrates the ninth anniversary of a calamity that won the sympathy of the world. On April 18, 1906, the devastation of earthquake and fire nearly destroyed the City; on April 18, 1915, she rises re-constructed, fairer than ever; and at her side stands the fabric of a vision, the Exposition that marks the establishment of the new waterway between East and West. We discuss the happy event in this issue.

DISCUSSION

FINANCING MINING OPERATIONS.

By Robert B. Todd 609

Many failures in mining are due to faulty financing of the undertakings. Our correspondent urges that all mining companies should be assessable, at least so far as development is concerned.

AMALGAMATION IN HARDINGE MILLS.

By H. W. Hardinge 610

Loss of quicksilver at the Plymouth mill was 0.025 oz. per ton of ore ground. The capacity of Hardinge mills ranges from 100 to 250 tons per 24 hours, according to the material being crushed.

METALLURGICAL PRACTICE AT PORCUPINE.

By C. H. Poirier 611

Re-grinding in Hardinge mills at the Vipond mill is justified on the basis that the installation cost is one-half that of stamps, the up-keep is less, only one-half the horse-power is required, and one-quarter less of solution is necessary.

RAISE OR RISE.

By F. Sommer Schmidt 611

Raise is in general use among mining men, but is not admitted by the dictionaries.

ARTICLES

THE ALASKA GASTINEAU MILL.

By L. E. Spray 612

The ore is broken in jaw-crushers and reduced to 2-in. ring by gyratories. It is then reduced to 10-mesh by two sets of rolls. It is then concentrated on Wilfley tables, classified, and the coarser product reground in tube-mills. The product of the tube-mills is concentrated on Wilfley tables. The high-grade concentrate is amalgamated and the low-grade is shipped. The remarkable departure from usual practice in gold milling attracts world-wide attention.

COST AT THE CROWN RESERVE MINE, COBALT 614

Page.

EXTRACTING COPPER WITH AMMONIA.

By C. H. Benedict 615

The first description of the process which Mr. Benedict has devised for recovering the fine copper from the tailing of the Calumet & Hecla mills by leaching with ammonia-bearing solutions.

CHOOSING ROCK-DRILL EQUIPMENT.

By P. B. McDonald 618

Sinking, driving, and stoping require different types of rock-drill equipment. The conditions that govern their choice are discussed by an impartial engineer.

CONDITIONS OF THE CHILEAN NITRATE INDUSTRY 619

Wages have decreased 25%, operating costs have increased. Three-quarters of the plants have shut down and many of the others are only working half-time.

ON CARNOTITE DEPOSITS—AND THE RAND BANKET.

By Chester T. Kennan 620

Conditions observed in Colorado deposits are described and their bearing on the formation of ore deposits in general is discussed.

LEYNER
DRILL SHARPENERS—OIL FURNACES

A MONEY SAVING COMBINATION

Installed at the Cuba Copper Co.

The Leyner Sharpener produces correctly made and gauged drill bits more rapidly and at less cost than they can be made by hand.

Correctly formed and gauged bits assure maximum drilling speed, lower consumption of drill steel, and longer life to the drilling machine.

The Leyner Oil Furnace supplies the heated steel fast enough to keep the sharpener up to capacity and therefore helps to effect a considerable economy, aside from the greater convenience and more uniform heat. The fuel cost is low.

This combination leaves the blacksmith time for other work which under other conditions would have to be slighted.

Leyner Sharpeners make and sharpen most kinds of bits and shank hammer and piston drill steel.

Bulletins 4022 and 9020 point the way to lower sharpening costs.

NEWS from Butte is good. Our correspondent there sends a cheerful and interesting letter.

WALL STREET'S effervescence as yet is mainly valuable for its sentimental effect. It represents an intelligent anticipation of events.

MINE operators in Mexico are weary of Huertistas, Maderistas, Carranzistas, and Zapatistas; they want to see the Wilsonistas to the front.

ACCUMULATION of gold in the United States is likely to continue on account of the one-sided condition of trade with Europe. Some of that gold might be used advantageously in stimulating business with South America.

IN this issue we publish a timely description of the Alaska Gastineau mill, the design of which marks a complete departure from standard gold-milling practice, and the adoption of ideas developed in the concentration of disseminated copper ore.

THE report on the petroleum industry of California, prepared by Messrs. R. P. McLaughlin and C. A. Waring, is now ready for distribution by the State Mining Bureau. It is an excellent piece of work, performed by capable men, and will be reviewed later in our columns devoted to that purpose.

OUR forecast of the route to be taken by the Government railway into the interior of Alaska has been confirmed by an official announcement by the Secretary of the Interior. The Alaska Northern Railway has been purchased for $1,150,000, and Mr. W. C. Edes is designated as chairman of the engineering commission that is to construct the line, at a total cost estimated at $26,800,000. Work is to commence at once.

AMONG the anomalies arising from the political chaos in Mexico is the depreciation in postage. Mexico is in the Postal Union and letters for the United States require a 5-centavo stamp, which during the Diaz régime was equal to 2 cents American. At the prevailing rate of exchange one can buy six or seven 5-centavo stamps for 5 cents gold. As the Government is doing business with other governments in the Postal Union on a gold basis, it is obvious that considerable financial re-adjustments will have to be made at the Postal Department.

ELSEWHERE in this issue we give the first detailed description of the process devised by Mr. C. H. Benedict for extracting the fine copper from the tailing of the Calumet & Hecla mills by leaching with ammonia-bearing solution. The difficulties encountered by earlier workers appear to have been overcome successfully in laboratory work. Engineers will await with interest the record of actual experience on a working scale. The construction of the first unit of the plant, which was delayed by the conditions created by the War, will soon be resumed.

EXPORT of tin has been placed under embargo by the British government. No tin metal or tin ore can be exported, except under special permit, during the period of the War, from any British possession or protectorate. Limited shipments to the United States can be made, under permit, if consigned to the British Consul-General at New York. When this was announced in London on March 22, the price of the metal fell, for the obvious reason that it restricts the market, tending to exclude the United States and Russia, more particularly, as buyers. In March the price had risen above the maximum in 1914. Nevertheless the demand for the metal is such that even this restriction of markets is unlikely to cause it to fall to the low level of last year. After the War, tin, with other base metals, will be in eager demand.

SHOULD Ontario have Government batteries? is a question asked in the *Canadian Mining Journal* of April 1 by Mr. George R. Rogers. He says that "of the various causes to which the decline in prospecting can be attributed, perhaps the chief of those within human control is the lack of sufficient capital to develop the many promising properties already acquired and held by the prospector." This applies to many other mining districts in the world. Mr. Rogers then discusses the State system of operating public crushing and treatment plants in Victoria and Western Australia, and says that the system should at least have a trial in Ontario. We have some personal knowledge of the Government-owned plants in Western Australia, and can say that on the whole they have been a decided success. They have been the means of stimulating mining and prospecting in many remote districts where no plant for recovering gold was available, and in localities where the freight to a custom-mill is prohibitive. Even when a group of small properties contains good ore, the collective owners cannot afford to erect a plant, and so in time are forced to close. Then the Government steps in and provides the means whereby the gold is extracted at reasonable cost. Discontent is not unusual among miners who have not received the yield they expected, but who ever heard of a prospector who did not over-estimate the value of his ore? In Western Australia there are 37 stamp-mills and cyanide-plants operated by the State. These cost £332,378, and have treated for small mine-

owners a total of 960,989 tons of gold ore yielding £4,109,321, and 64,920 tons of tin ore producing £80,835. It is certain that without these Government mills most of this metal would never have been recovered. The effort has stimulated mining and prospecting. One objection to the system does exist: the miners ofter extract the richest ore in their claims and then abandon them, whereas if the men had their own plants they might develop their properties. Most public-controlled utilities in Australia are fairly profitable, but the Western Australian public mills do not meet all charges; including operation, interest, and depreciation the total deficit in 15 years has been £413,965. However, the taxpayers no more object to this loss in the recovery of the gold than to the annual loss incurred on the great waterworks that supply the mines.

1906-1915

On April 18, San Francisco celebrates the ninth anniversary of its day of disaster, when the city was swept by the conflagration that came in the wake of an earthquake. The celebration is an expression of joyous vitality, of pride in a superb achievement, of confidence in a great future. To those of us who remember the trembling earth, the crumbling walls, and the encroaching flame, the 18th of April would be only the memory of a horror if all that is searing in the recollection had not been overlain and eclipsed by the stimulating experience of the later days of reconstruction and restoration. Today we live again the time when we saw the ruins removed, the streets cleared, the new foundations laid, and heard the merry sound of the riveters arising from among the steel skeletons that gave the promise of the new San Francisco.

"From mighty roots of concrete deep
The giant flowers spring from sleep
Along the barren highways of the city of my love."

The dawn of that resurrection dispelled the darkness of destruction. San Francisco triumphed over fate. Even the shackles of municipal corruption could not check her heroic courage and splendid audacity. From ruins scarcely cold the City rose in strength and beauty, the poet's "warder of two continents." Nine years ago she lifted an ashen face to the blue of a pitilessly perfect sky; today she smiles serenely in the sunshine of California and welcomes the whole world to her side. She celebrates not her restoration only, but the fulfillment of a dream that came to her while yet she lay stunned under the lurid heavens. The water-way joining West to East, the Pacific to the Atlantic, has been made; the dike separating the old and the new worlds has been pierced; the port of San Francisco has become the terminus of a new maritime commerce. It is fitting that the event should be signalized by a foregathering of representatives of industry from the four quarters of the earth. Unfortunately, it happens that this event synchronizes with a great war, pulling the heart-strings and darkening the imagination of all thoughtful men. Nevertheless the coincidence is not without a lesson, for it contrasts construction with destruction, the conquest of man over nature as against the reversion of mankind to the ethics of the jungle. To us, standing among the beautiful structures of the Exposition that marks the constructive genius of man and celebrates the accomplishment of beneficent engineering, the rumbling of the European upheaval comes like the sound of the surf heard far inland. We hear it not with indifference. Bret Harte called San Francisco "serene, indifferent of fate." That may have been when the original settlement of Yerba Buena first emerged from its Spanish background; that may have been true of the town that was built by the Argonauts in the Golden Age; but it is no longer true of the modern San Francisco. Too intensely vital to be indifferent, too cosmopolitan to be phlegmatic, the City by the Golden Gate pulsates with the energy of an international haven and vibrates with the life of one of the world's nerve-centres. The indifference is gone, the irresponsibility is vanished, San Francisco is awake to her destiny. With her back to the trail that brought her people over mountain and plain from the distant seaboard on the other side of the continent, she faces the sunset with an earnest look. The Atlantic breakers sound faint; the surf at her feet thunders a welcome. Her eyes have caught the glow of the horizon and in her ears is the song of the Pacific, bringing the promise of commerce with the immemorial East that has become a new West. She has waited; she has suffered; mindful of her past, confident of her future, remembering the hour of disaster and the morning of her resurrection, she gazes with gladness into the sunlit sky and thanks God most of all for her unconquerable soul.

Speculation in Mines

On another page we publish a letter from a correspondent who surmises that a revival of mining is likely, and that the time is opportune for discussing ways of making public participation more profitable than it has been heretofore. The subject is one of immediate interest. We shall discuss it with the hope that the expression of our own views may elicit the opinion of others having experience, by observation or by participation, in such matters. Mining, as a national industry, depends, in large measure, on public support. Owing to the risk inherent in the search for the metals in ore deposits, it has been found desirable and convenient to distribute the financial obligation of exploration and development among numerous shareholders, each contributing a small part of the working capital, instead of leaving the burden on the shoulders of a few operators. In the early days of the Comstock, the distribution of liability was effected by sub-dividing a mine into the number of feet that measured the extent of the claim. A shareholder owned a 'foot' or more of the property, and a speculator bought 'feet' instead of shares. This hardly sufficed to meet the necessities of finance, so the

proprietary was divided into hundreds or thousands of shares, until now a stock certificate may represent the ownership of one in a million parts of a mining enterprise. This development of the business has tended so greatly to popularize speculation in mines that the small shareholder in the aggregate has become an important factor. Another result followed: people quite ignorant of mining now dabble in shares; an undiscriminating, if not gullible, public has come to the support of the less responsible promoters of mining schemes. Obviously, it is desirable that the financial support available for new mining ventures should be wide, but it should also be discriminating, in order that it may prove remunerative. Those who have the welfare of the industry at heart want to see plenty of capital forthcoming, and they want to see that capital employed profitably, so that further supplies of it may be available as occasion arises. To ensure such a result the public must be given a run for its money. It must have a fair chance of a return of capital, together with a reasonable interest thereon. The interest must be proportional to the risk. Any return of less than 10% on a mining venture is insufficient, for the risk inherent in such a highly speculative business requires the redemption of capital within a relatively short period. To liken a metal mine to a manufacturing business is fundamentally fallacious, for a mine is a wasting asset. When exhausted, it has no goodwill. Even its equipment goes to the scrap-heap. On the other hand, no economic unit is so productive as a rich mine; it represents the mineral wealth concentrated by Nature during geologic periods; it is the harvest of a seed-time antedating human history; it is a treasure-vault that requires only the key of the enterprising explorer. However, the romance of fortuitous discovery is passing; the obvious outcrops and the superficial enrichments have been garnered; nowadays, to find ore, the miner must dig deep or win a precarious profit from the poorer or more refractory lodes that his predecessors discarded; today the exploitation of ore deposits calls for skill and experience; it demands the technology of the engineer. And only the deliberate statements of a properly qualified engineer are of any value to guide the speculator. This is the lesson that the public must learn. Only those versed in the appraisal of mines can give estimates that are of any value in this business. Of course, we are discussing the serious and legitimate phase of the industry. The selling price of shares may be affected by conditions entirely dissociated from actual mining operations; in the last resort it is the excess of buying over selling that elevates quotations, just as the excess of selling over buying depresses them. Artificial conditions can be, and often are, created by manipulation, and by unveracious statements by interested parties. Amid such a conflict of evidence, the public should look to the engineer in charge of the mine for a true statement of facts, and the engineer is on his honor as a member of an honorable profession to tell the truth. In the end, therefore, only a continued improvement in the status of the profession and the consequent reliability of the reports made by engineers of mines can safeguard the public.

Meanwhile we warn the unsophisticated not to confuse investments with speculations. In mining, the simpleton treats a mine as an investment, while the sagacious man recognizes it as a speculation. The placing of money to earn income is an investment; it assumes the use of capital so safely that only the question of interest arises. The use of money with a view to the rapid enhancement of the principal is speculation; it assumes that the fluctuation of the principal renders the question of dividend of secondary importance; the dividend becoming merely a factor in determining the rise or fall of the principal. The difference between an investment and a speculation is that the scrip representing an investment can be locked in a safe for a term of years, while the stock representing a speculation must be immediately available for realization in accordance with the vagaries of the market. We omit mines owned privately. As to all others, it is safe to say that the price of shares in one year usually varies over a margin far exceeding the amount of the dividend. The speculator leaves the dividend to the supposed investor and realizes upon the rise or fall of the shares themselves. The length of time it is safe to hold a mining share as a source of income depends upon the persistence of the orebody and the continuity of good management. But these are matters too important for casual treatment. For the present we lay stress on two basic ideas: (1) that mining is essentially speculative, and is most remunerative when so recognized; and (2) that the only appraiser of a mine worthy of confidence is the properly qualified engineer.

Mining Ventures in China

Last week we referred to the waste of experience in mining; no less to be deplored is waste of energy in an industry that requires great preliminary effort to realize the hope of profit. Years ago, when mining in general and metallurgy in particular were regarded by their practitioners as secret arts, much duplication of effort was unavoidable. That day happily is past, and most engineers now regard it as a part of their duty to make a record of their experience so that it may be freely available to their profession. Each record of experience establishes a base of supplies farther ahead into the wilderness of the unknown. The efforts of an investigator who starts at the farthest outpost will carry him into unexplored territory, whereas if he started from familiar regions his labors might carry him only as far as others have already penetrated. But this great thesaurus of research has the defect of its qualities, for it is so considerable in amount and so widely distributed that no little trouble is required to learn what is already a matter of record on unfamiliar subjects. The labor of making a careful search of current literature is always great, and there is the possibility that nothing useful may be found; hence it comes about that investigations,

especially those at the mill or smelter, are often begun without this necessary preliminary, so that research that might have been carried to a useful conclusion is stopped at the same point where some other worker laid it down. Labor is wasted. Scores of instances might be cited, but it will suffice to point a moral and adorn this tale to give some instances of wasted effort in investigating the mineral possibilities of China.

China has been known to the Western world for centuries, and in the course of that time a tremendous amount of literature has been written, covering every phase of scientific knowledge, from astronomy to zoology, in its relation to China. Many geologists and mining engineers have studied the mineral resources of that country; some of them, notably Ferdinand von Richthofen, have made elaborate and comprehensive reports. But in the development of a mining enterprise knowledge as to the character and extent of deposits is not sufficient, for many other factors must be considered, and in passing upon the feasibility of working any given deposit a vast amount of collateral information is required.

Of the geologists and engineers that have studied the deposits of China one or two score are still alive. In conducting any new investigation it would seem but reasonable to make use of the knowledge acquired by these, but with rare exceptions nothing of the kind has been done. In choosing the advisers to the Bureau of Mines at Peking, men were selected who had never been in China, and who must therefore devote a large part of their mental energy to familiarizing themselves with conditions quite new to them. An important corporation required an engineer to study the possibilities of China in one field of mining work, and selected for the purpose not only one who had never been in China, but who as well was quite unfamiliar with that branch of mining, having specialized in totally different work. When the Standard Oil Company was ready to start exploration for petroleum in China on a large scale it also, with the curious mixture of ineptitude and sagacity that characterizes the operations of that huge organization, made no attempt to utilize the accumulated experience of men familiar with the East, but sent out some of the best men available who were quite unacquainted with China. We have heard various reports of the results of their work, and, after discounting these sufficiently to allow for professional jealousy, the net residue indicates that these workers have had to overcome many obstacles that might have been avoided by those familiar with the country and its people. An engineer sent to explore an unknown country must perforce devote his energies to acquiring familiarity with general conditions, but in known territory it is an exhibition of the simplest business sense to utilize the information that is at hand. No one would consult a throat specialist to treat a cancer, expecting him to familiarize himself with surgery before undertaking an operation; the obvious procedure is to consult a skilled surgeon. An even more curious case has come to our attention, an engineer having made the journey to Peking in order to acquire information that might have been obtained by a half-hour spent in reading the files of the *Mining and Scientific Press*. The editors undertake no professional work, holding professional fees incompatible with editorial duty, but they are at all times willing to render assistance to their professional colleagues. Failure to utilize accumulated knowledge is merely a phase of ignorance.

In considering China as a field for mining investments, four factors must be taken into account. Is there good evidence that mineral deposits rich enough to offer hope of profit exist in China? Are labor conditions and other local factors influencing the cost of operation such as to indicate that mines can be operated on an economic basis? Is there a reasonable expectation of sufficient and growing markets safe from capture by imported products? Are the laws and regulations governing the mining industry such that mine-operators can expect to carry on their enterprises under fair and stable conditions? The first of these queries was discussed in detail in the *Mining and Scientific Press* of October 7 and November 11, 1911. Briefly, the answer is in the affirmative. Labor conditions in China are discussed in this same article, and again in more detail in the issue of November 25, 1911. The conclusion is that labor is both abundant and efficient, while wages are low. As regards markets, it is difficult to generalize concerning an area of nearly 4½ million square miles, but it is fairly evident that an immense, densely populated country, which is just entering upon an era of railway-building and general industrial development, must necessarily be an inviting field for the adventurous. So far, all the factors are generally favorable, but the fourth negatives all the attractions. The regulations and the Bureau by which mining in China is governed were discussed in the *Mining and Scientific Press* of June 20, 1914. It is there set forth that these regulations are so unfavorable to the investing of foreign capital in Chinese mines as to render it almost impracticable; in short, the regulations appear to have been drawn with the purpose of leading to a maximum of official interference, with opportunities for graft, and a minimum of work. Some of the junior officials in the Bureau of Mines are excellent young men who have studied mining; the chiefs are totally ignorant of any phase of it. Swedish and British mining advisers have been appointed, but there is no evidence as yet that their advice has been followed. Treaty stipulations provide that foreign capital must have equal rights with domestic in the development of mines, but this does not cover the present situation, in which neither is accorded reasonable rights. Attempts are being made to have a more liberal code substituted. Large organizations may secure concessions exempt from the general regulations, as is the case with the Standard Oil Company, and in some instances the expectation of profit may be sufficiently alluring to justify attempts to work under existing regulations.

DISCUSSION

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Financing Mining Operations

The Editor:

Sir—From all appearances, there is a revival in mining, and the public is taking an increased interest. The question will soon be interesting to many as to how to invest and what companies are worthy of encouragement. Following the panic of 1907, which was the end of the last mining boom, all companies of questionable merit were forced to the wall, and many meritorious ventures as well. As a result of the conditions prevailing during the last boom that were possible at that time, many states have passed stringent laws for the protection of the investor, and the government has taken a hand by prosecuting many of those not doing a legitimate business. While these conditions in the end will have a beneficial effect on honest mining, conditions have made it almost impossible, during the past few years, to raise the necessary funds for the development of promising properties. Today there are more promising prospects in Nevada and the Pacific Coast states than ever before, that could be put on a profitable paying basis for a moderate expenditure. On many of these properties large amounts have been expended, and they are sufficiently developed to warrant reduction facilities. Others have been developed to such an extent that they are beyond the 'wild-cat' stage and almost certain to make mines. While the speculative element cannot be completely removed from mining, I think the investor has a better chance of a 'square deal' today than ever, and that by using care and good judgment large returns can be made on such investments.

It would be well to review the past to a certain extent and show that many so-called failures were not the fault of the operator or promoter, and that most of the criticisms of the past come from those who have put a little money in some companies as a 'flyer' or a gamble, investing indiscriminately without any investigation in anything that was offered. I was in New York a few years ago endeavoring to raise funds for a reduction plant on a developed mine, and interviewed investors with that end in view. I was acquainted with a man connected with one of the largest wholesale grocery houses there, so I called on him and stated my proposition. He seemed interested, said I was just the man he wanted to see, but as he was busy would I call after office hours. When I called later he pulled out a bunch of mining certificates from a drawer, I think there must have been a hundred, and requested me to look them over and tell him if they were any good, as he had been unable to find out anything about them and had had them for several years. Out of the lot there were only four or five companies that I had ever heard of, and they were not operating at the time. I asked him how he had secured such a collection, and he said mostly by answering advertisements, although he had purchased some from solicitors. He is a hard-headed business man, but he had spent thousands of dollars in these stocks and had not taken the trouble of looking them up until years after. Another man had purchased stock in twenty-six companies, mostly mining. There were 500 shares in the lot of a company that I knew of, but of the others I had never heard. He offered the lot for $25, and I gave him $50, about the value of the 500 shares. I have them all yet; most of them apparently rank fakes, bought on the strength of the certificate without any investigation as to what the purchaser was buying.

These are only two instances of probably over a hundred cases—all people of rather more than average ability, merchants, railway officials, doctors, ministers, and lawyers. It is no wonder that the fake promoter can succeed and that the legitimate mine operator has been unable to raise a development fund. Following the panic of 1907, many non-assessable companies were unable to pay their debts or continue development. Stockholders were appealed to, meetings held, voluntary assessments asked for, but most of the propositions failed and stockholders who were willing to do their part would not unless all would respond according to their interest. This resulted, in many cases, in reorganizations as assessable companies. In some cases, enough stockholders would consent to enable them to change the company from non-assessable to assessable, but in some cases this was not possible on account of the laws under which they were incorporated. The companies were unable to pay their debts and continue operations. Some of the companies, rather than let their property go by default, permitted the properties to be sold for debt, bought them through a trustee, and formed new assessable companies. All previous stockholders were given the opportunity to come into the new companies on the same footing as those who engineered the reorganizations. Generally half of the stockholders did not accept the opportunity, and felt that they had been badly treated, and would have preferred that all should lose rather than have those who had faith in their companies, and were willing to accept the conditions, protect themselves in the only way possible.

I think every company should be assessable as far as developing is concerned. When property is bought with stock, it might be necessary to have a certain amount of non-assessable stock for that purpose. When purchased for cash, the assessable stock should be sold for an amount sufficient to pay for the property as well as cover the cost of promotion, organization, development, and the fixed charges controlled by the by-laws, and at the subsequent sale of treasury stock the price be increased equal to the amount of the assessments paid when sold. In this way any shareholder would come into the corporation on an equal footing at any time, and it would be 'up to' the stockholders whether to sell treasury stock for development purposes or be assessed for carrying on the work. This would prevent the operations of the fake promoter and make the investor realize that a corporation is a co-operative concern, as well as the fact that instead of 'taking a flyer' in any stock offered he should confine his investments to the most promising properties after careful investigations and render all assistance possible. Mining under proper conditions need not be more of a gamble than other industries. There is no more reason for losing money in mining than in any other industry. Statistics show that about 95% of those who engage in business fail—failures as great as there has been previously in mining with probably ten bogus promotions to one genuine. Look at the Goldfield boom. There were about six thousand promotions; all of them had stock for sale and sold more or less. If the nine-tenths of these had not been exploited, the tenth, or six hundred concerns, would undoubtedly now be running instead of about two hundred in the state of Nevada alone.

If the investor would give the same attention or scrutiny to mining that he does to other investments, it would be well and he would reap a larger reward than in any other business. There are more failures in mining for want of funds than any other cause. It takes money to develop a mine, and the loss in a prospect need not be great with the proper man at the helm. It is of more importance to know when to stop than to go ahead on an impossibility. Many a good man has been ruined and a good property abandoned for lack of funds occasioned by the individual stockholders declining to recognize their responsibility or to co-operate with the management. They blame delay and failure on the management when generally the stockholders are so indifferent to their own interest that it is practically impossible to accomplish results. The only way to remedy the prevailing conditions is to have all companies assessable. Then the burden of carrying on the necessary development is equitably distributed, and the man unwilling to do his share forfeits his interest. Usually this works no injustice. Sometimes people may be so situated that they cannot meet their assessments, and forfeit their holdings, but some plan must be had for raising funds, and it is not right that all those who are willing and able to carry on the proposition should lose all of their previous investment. The delinquent would be no better off and all stockholders would lose with him. The fact that a company is assessable removes from the enterprise the speculative element and brings home to the stockholder the necessity for co-operation.

ROBERT B. TODD.

Los Angeles, California, February 15.

Amalgamation in Hardinge Mills

The Editor:

Sir—I note the editorial in your issue of February 27 regarding amalgamation in Hardinge mills. You mention that amalgamation in conjunction with the Hardinge mills at the Plymouth plant has been dispensed with. In justice to the Plymouth management I wish to correct my suggestion, made in a previous discussion on this subject, that the test of amalgamating in the Hardinge mill was not carried on long enough for a decisive opinion. This was an error, for I have just received a letter from Mr. S. R. Brown, the mill superintendent, bearing upon this very subject. He states that a test-run of 21,000 tons of ore showed a total loss of only 528 ounces of quicksilver. This, reduced to economic figures per ton of ore ground, means a loss of 0.025 oz. quicksilver, or about one-tenth of a cent, per ton of ore. Mr. Brown also sends me an interesting photograph of gold amalgam balls, about ¾ in. diam., formed in the Hardinge amalgamator attached to the pebble-mill. These balls he describes as containing 50 to 60% gold, while the plate amalgam only contains about 25% gold. The total saving of the plant, as might be expected, is much higher than when the mill originally started; in other words, the amalgamation now appears to be highly satisfactory.

In the same issue of your journal I note the interesting article by Mr. J. W. Pindar bearing upon this subject. I concur in his opinion that there should be no more flouring of quicksilver in grinding in the pebble-mill than is produced by the grinding between the mullers of a pan. My own experience coincides with Mr. Pindar's in that a comparatively limited loss of quicksilver results in pan-amalgamation. Mr. Pindar, however, takes exception to the capacity of the Hardinge mill in the following words: "When I hear of a 22-in. by 8-ft. Hardinge mill endeavoring to grind, and properly amalgamate, 175 tons of ore per day, when the makers of that mill announce 144 tons as the extreme capacity limit for that size for grinding alone, and presumably under the most favorable conditions, I feel that something must be radically wrong and am not surprised at unsatisfactory results. On the other hand, I am surprised to hear of having to stop a Hardinge mill every day to clean it out."

Mr. Pindar is mistaken in this matter of capacity and misunderstands our claim. There are instances where the limit of the Hardinge mill is 144 tons; our company has records below 100 tons and above 250 tons, but 175 tons is not unusual. Crushing, like amalgama-

tion, is dependent largely upon requirements and necessities effected by the chemical and physical quality of the ore undergoing reduction.

In regard to stopping the mill and making a clean-up: as a rule an average clean-up would not be necessary for several days. Mr. Elmer mentioned that he cleaned up the inside of the Hardinge mill whenever he required an extra large disbursement, which sometimes was not necessary for several weeks.

New York, March 7. H. W. HARDINGE.

Metallurgical Practice at Porcupine

The Editor:

Sir—I have considered with interest your extracts from the paper of Mr. Noel Cunningham appearing in your issue of March 6. I take no exception to Mr. Cunningham's views as based upon his observation, but I feel that as manager of the Vipond plant, mentioned in the paper, I am perhaps better qualified to express my views upon the installation of Hardinge ball and pebble-mills.

As the pioneer introducer of these mills in the district, and in opposition to recommendations by other engineers, I had the temerity to carry out my ideas in the designing of the Vipond plant two years ago, and installed the then new system of crushing. Two years' experience has, at least in our case and that of our neighbor, the McIntyre mill, justified the departure, for the following reasons:

(a) First installation cost less than one-half that of stamps for equal capacity.

(b) Up-keep less than that of stamps.

(c) Twice the capacity in tons per horse-power.

(d) Crushing in one-quarter the amount of solution required by stamps and consequent reduction in cost in handling the solution after crushing.

Another item of considerable importance is the fact that our overhead mill-space has been reduced one-half, which, in a cold country like Porcupine, is of decided economic importance.

Referring to Mr. Cunningham's reference to Hardinge fine-grinding short conical mills: our fine grinders of the Hardinge type are only 6 ft. long, requiring 30 to 33 hp., which I believe is about half of the power required for the longer (20 ft.) mills in the other plants of the district. Those other plants, in my opinion, are not doing any more work than is being performed in our conical mills, which are "short" as compared with the ordinary cylindrical sliming-mill. As an evidence of my opinion, and with my directors' endorsement, I have now placed an order for a 6-ft. Hardinge ball-mill in order to double the capacity of our plant. While Mr. Cunningham writes from observation, I write from experience and observation as well.

As Mr. Cunningham mentions, the Vipond and the McIntyre plants have about equal proportions of the A and B class of ore mentioned in his paper.

Cobalt, March 16. C. H. POIRIER.

Raise or Rise

The Editor:

Sir—In my article on 'The Caving System at the Ohio Mine,' appearing in your issue of March 6, I see you have changed the "inclined raises" of my manuscript to "inclined rises." I am not taking offense at this, but there is apparently more than one way to get a rise out of a man. What is the matter with our good old 'raises'? "Inclined rises" sounds affected and unnatural to me. My friends 'the boys' who have been driving those raises will think I am trying to put on airs and be pedantic. I cannot recall ever having heard this particular kind of a hole in the ground called a rise in these Western states. This seems to me a good old book word that is fast falling out of use. I do not object to your making contributions conform to your style-sheet, but I think every effort should be made to conform to the usage of men in the business where this is permitted by the authorities, as is the case with this word 'raise.'

I think the less you tamper with a manuscript that stays within the law of correct usage, the better, and, while I care little about this particular word, I care more about a conciliatory attitude on the part of editors in questions of this sort.

F. SOMMER SCHMIDT.

Salt Lake City, March 16.

[Mr. Schmidt will be interested to know that the same point was raised by one of our editors, but it was finally decided that 'rise' is the proper spelling. The Century dictionary does not admit the form 'raise' at all, and the only sanction to be found for it is the Standard dictionary, which says "The same as rise." The noun 'rise' comes from the verb 'rise', which both dictionaries define as to dig or work upward in mining, in opposition to 'sink.' The use of 'raise' as an intransitive verb is not admitted by either dictionary. 'Raise' is undoubtedly in general use underground, and the verb 'to raise' is sometimes heard, but there is no authority whatever for the latter usage, and it will be agreed that what a miner makes by rising is a rise. As to changes in manuscript, it must be evident that the duty of an editor is to edit manuscript. That he should correct only the more obvious blunders seems as irrational as to expect the general manager of a mine to allow every man in his employ to do whatever may seem fit to him, short of absolute mistakes. The function of the editor is to facilitate the transmission of ideas from the contributor to the reader.—EDITOR.]

BULLION TRANSACTIONS at the San Francisco Mint in March were as follows: gold received, 329,283.779 fine ounces, and silver, 58,945.59 oz., the total value being $6,837,273.90. Coinage executed amounted to $4,160,000 gold, $78,000 silver, and $12,000 copper; also ₱77,000 in 20-centavo pieces for the Philippines. Coin, bullion, etc., on hand at the end of the month totaled $269,064,655.74.

The Alaska Gastineau Mill

By L. E. SPRAY

The first unit of the Alaska Gastineau Mining Co.'s ore-reduction works at Thane, one of Juneau's industrial suburbs, was started on February 18, 1915. The machinery went into motion like the parts of a watch, and has been in continuous operation ever since. The tonnage treated is considerably in excess of the expectations of the owners and builders. Whereas it was estimated that each section of the big mill would have a daily capacity of 1500 tons, the actual run has been nearer 2000 tons per 24 hours, and it is now believed that this mill, when all of the machinery is installed, will have a capacity of 10,000 tons daily instead of the 6000 tons first contemplated.

The work of installing the machinery for the remaining three sections of the mill is now under way, and it is planned that a new working section shall be added every 40 days until the plant is complete. With the exception of the coarse-crushing plant, the four sections are housed in one large building. The mill was designed by George Bradley and F. G. Janney, consulting engineers, under the supervision of D. C. Jackling, managing director of the company, along lines marking a radical departure from the regular system of handling gold ores. The old methods of crushing and amalgamating have here been put aside for the introduction of the comparatively new system of handling the so-called porphyry or disseminated copper ores—the methods that resulted in producing copper at a cost of 7 cents per pound. The very latest knowledge in building and engineering has been applied in working out the details of the construction and equipment; in consequence this mill contains some features not found in others of its kind—all tending to safety and economy.

Robert Semple was superintendent of construction, which began with excavating for the foundations in November 1913. The mill is built for permanency, concrete and structural steel being used throughout. Charles E. Bruff, superintending the installation of machinery, has been doing this sort of work for the Jackling mining interests for a long time, and he declares that this is the most modern and one of the finest mills in existence.

The coarse-crushing plant, also built of steel and concrete, is situated on the mountain-side at the terminus of the traffic railroad and at an altitude of 700 ft. above the sea-beach. The building is 100 by 100 ft., rising to a height of 125 ft. above its lower foundations. It has been constructed with a view to serving other units of the reduction works in addition to the one just placed in operation, and has a capacity of more than 20,000 tons daily.

The fine-crushing plant and concentrating mills are housed in what is practically one building, erected in a series of steps, measuring from the floor of each division or milling process, and designed in accordance with the gravity system that prevails throughout. The fine-crushing plant proper occupies a space of 80 by 360 ft., this portion of the building rising to a height of 160 ft.; the concentrating mills occupy a space 140 by 405 ft., that portion of the building reaching a height of 80 ft. The last or lowest floor of the concentrating mills is 192 ft. above sea-level, thus affording ample grade for the convenient disposal of the tailing, which is carried into the sea. A system of levels has demonstrated that the tailing may be carried to Taku Inlet, some considerable distance from the mill-site, and to a point where there is unlimited room for final disposal.

It requires about 6000 hp. of electrical energy to operate the mills and mines. This is furnished by the big Salmon Creek power-stations, owned by the company and erected simultaneously with the mine and mill development of the past two years. There are two stations, one at sea-level near the mouth of the stream, and the other at the upper end of the first basin at an altitude of 350 ft. immediately below the falls. An immense concrete dam holds in storage 19,000 acre-feet of water as reserve to keep the great Pelton wheels moving during the winter months when the natural flow of water diminishes.

The ore comes from the Perseverance mine and is hauled to the reduction works over an electrified railroad for a distance of 18,000 ft., two-thirds of which distance is through the celebrated Sheep Creek adit, extending under and into the mine. The ore-trains consist of thirty 10-ton cars each, and are drawn by 18-ton electric locomotives. The trolley system is used on the road.

E. V. Daveler is superintendent of the mills. The milling process begins the moment the cars reach the tipple of the coarse-crushing plant. Four loaded cars are pushed into a long steel cylinder that revolves in response to the touch of the operator, the ore dropping to a large inclined grizzly of massive steel bars. Completing the revolution in a few seconds, the empties are replaced by loaded cars and the operation repeated, the entire train of 300 tons being discharged in a remarkably brief space of time.

When the ore strikes the grizzly the under-size drops through to a conveyor that feeds it into No. 8 gyratory crushers where it is reduced to 2-inch size or under, and thence to the ore-storage pocket. The over-size passes through two monster jaw-crushers and thence to the gyratory crushers for further reduction.

The ore-storage pocket is unique, in that it has been hewn from the solid rock of the mountain beneath the floor of the coarse-crushing plant. The big cavern with

a capacity for 10,000 tons of ore was stoped out from an inclined tunnel-way leading from the fine-crushing plant. The rock obtained in the process was utilized in the mixing of concrete for mill-construction, this material being used in considerable quantities.

The ore is drawn from the storage-pocket to the fine-crushing plant on a large conveyor-belt that travels through the inclined tunnel-way mentioned, a distance of some 600 ft. Here it goes through a pair of 72-in. Garfield rolls and is reduced to inch-size, the over-size returning by automatic skips, operating in balance, for another crushing. The under-size material passes to 54-in. Garfield rolls on a conveyor-belt and is reduced to 10-mesh; thence it passes over impact-screens, the under-size dropping through to the finished-bin and the over-size returning for another grinding. The ore is screened after each operation, the under-size always dropping to the next process. The material travels continually in a closed circuit until the Garfield rolls have reduced it to the fineness required for the finished-bin. The rolls are so gauged or set that the crushing process includes the impact of ore-particles with each other rather than a direct impact of rock with machine. This permits of a large and constant stream of ore through the rolls, the returning over-size, on conveyor-belts, traveling at a lively rate of speed and joining the persistent flow of new ore in the process. The automatic skips work in pairs, one going up as the other descends. Each skip holds three tons. It is set on a trap-chair that releases it automatically when the required weight of ore has been deposited in the bucket. It moves as silently and smoothly as if traveling in a channel of oil.

The ore remains dry until immediately before reaching the concentrating mills. After being drawn from the finished-bin, it passes over a set of Garfield roughing-tables; thence to Wilfley tables, and thence to the Richards-Janney classifier. The coarser product from the classifier goes to the tube-mills, of which there are 20 in the whole unit, and five now working. The tube-mill product, with the fine from the classifier, goes to the lower Garfield tables and is then finished on the Wilfley tables.

The final product consists of concentrates of different grades and values, the highest grade of which contains the gold that ordinarily would be amalgamated, and receives the same careful attention that is usually given to this product. The poorer concentrate is ready for shipment.

While the remainder of the machinery is being placed in position for operation in the present mill or first unit of the works, plans are being made for the immediate construction of another mill of equal capacity, thus increasing the milling operations to 20,000 tons each day. When one contemplates the enormous tonnage involved in a year's operation at this rate, he can not fail to be impressed with the tremendous ore reserves of the Perseverance mine from which it all must come.

It will be noted that there are two striking features in the milling system: first, the closed circuit whereby there is permitted a free and constant flow of ore, and in which the ore crushes and reduces itself through the incessant grinding of ore against ore in its passage through the rolls; and second, the first recovery of concentrate which is of the highest grade, and which contains in this case galena and the coarse gold as well as much of the fine that would be recovered by the ordinary amalgamating process in the battery and on the plates. The proportion of concentrate of this grade is small; at present it is being reduced and run into base bricks in a large ordinary bullion furnace.

The town of Thane is situated on Gastineau Channel about three miles from Juneau and almost directly opposite Treadwell. It was named in honor of B. L. Thane, general manager of the company, who has done so much toward bringing about the extensive developments in progress about Juneau.

The town contains, besides the big reduction works described, many modern service buildings such as extensive machine-shops, woodworking and carpentry shops, stores, warehouses, wharves, an auxiliary pumping-station, an auxiliary oil-burning power-station; homes for the employees, including 28 cottages, 6 lodging or rooming-houses, each with a capacity for 50 men, and a boarding-house with a capacity for 300 men—all built with every provision for safety and comfort.

A school has been established in a building provided by the company, and the children of employees have every facility specified by the Nelson law. The post-office is situated in the company's general store. Private enterprises conduct several businesses in or near the town by consent of the company, including a modern steam-laundry, but no liquor is sold on the premises nor can it be obtained nearer than Douglas or Juneau. A sturdy civic pride has already manifested itself in the community and the inhabitants have commenced to beautify the place.

Costs at the Crown Reserve Mine, Cobalt

In 1914 this property produced 1,425,320 oz. silver from 288 tons of high and 31,347 tons of low-grade ores, at the following cost:

	Cost per oz.
Mining and development	$0.0870
Power, light, and heat	0.0190
Maintenance	0.0140
Ore handling	0.0196
General expense at mine	0.0202
Superintendence	$0.0075
Total mining	$0.1673
Smelter	0.0127
Milling	0.0900
Depreciation, office, etc.	0.0195
Total costs	$0.2895

THE PANAMA CANAL is ready to make deliveries of fuel oil to vessels at Balboa and Cristobal, and has established a rate of $1.25 per barrel of 42 gal. for fuel oil sold by it to vessels alongside the cribs. There is no wharfage charge for vessels taking oil at the crib, just as there is no charge against vessels using the other docks solely for the purpose of taking on coal or other supplies furnished by the canal.

Extracting Copper With Ammonia

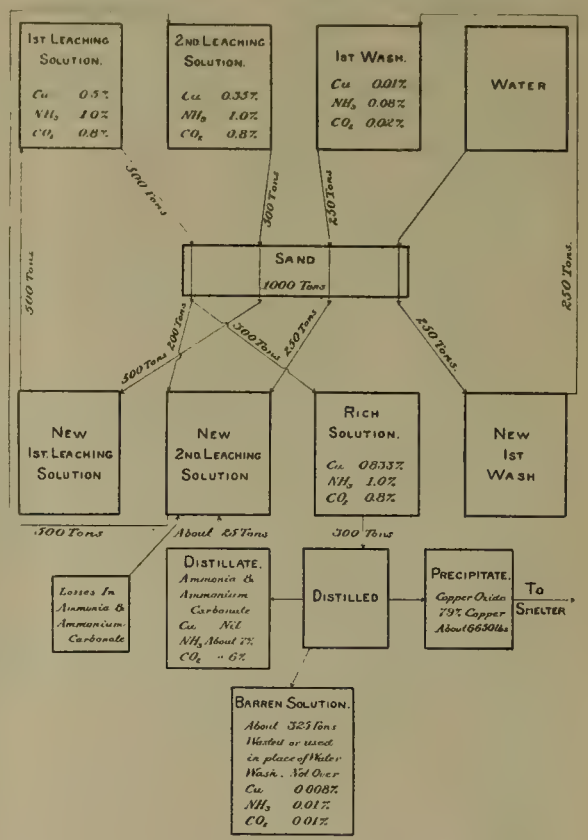
By C. H. BENEDICT

*It has long been recognized that (1) copper oxide will dissolve in ammoniacal solutions, yielding copper-ammonium compounds; (2) solutions of cupric-ammonium salts are capable of dissolving native or metallic copper, yielding cuprous-ammonium salts; (3) these cuprous-ammonium salts may be oxidized, by air or other suitable oxidizing agents, to cupric-ammonium salts; and (4) copper-ammonium solutions subjected to distillation, are decomposed with separation of copper oxide, ammonia being volatilized.

It has been attempted to apply ammoniacal solutions to the extraction of copper, including native copper, from its ores, but such processes have not heretofore been commercially successful, owing primarily to the heavy losses of the expensive and highly volatile ammonia, and to the high cost of the installation necessary to minimize the losses of ammonia due to volatilization from the solutions used. The present invention is designed to overcome these and other difficulties.

My investigations have shown that the losses of ammonia, which have been a serious factor affecting the commercial success of prior processes, are not due exclusively to volatilization, as has been heretofore assumed, but arise largely from the adsorption of ammonia by fine sand and slime, the adsorption by slime being greater than that by sand. I have also found that the adsorption losses are, in a general way, proportional to the concentration of the ammoniacal solution; and that in highly dilute solutions, that is to say solutions containing 2% or less of NH_3, in the free state or in unstable combinations with copper, the adsorption losses are so small as not to interfere with the commercial aspects of the process, provided the sand is substantially free from slime. The use of such highly dilute solutions presents the further advantage of minimizing the losses of ammonia by volatilization. It has not heretofore proved practicable to employ highly dilute solutions of this character for the extraction of copper from sand or other ores, for the reason that the solvent capacity of such solutions for copper is necessarily low as compared with that of stronger ammoniacal solutions, with the result that the volume of solution which must be handled and regenerated in order to produce a given quantity of copper has been large, this in turn necessitating a large and costly installation.

It is a primary object of the present invention so to operate a cyclical leaching process as to render it practicable to use these highly dilute ammoniacal solutions of copper for solvent purposes, securing thereby the advantage of small or negligible losses of ammonia and of copper, without unduly increasing the cost and size of the installation. To this end, the cycle of operations is so arranged that an amount of copper equal to that extracted from a given batch of ore will be found concentrated in a relatively small proportion of the total volume of solution brought into contact with this ore. A suitable volume of this stronger solution is subjected to distillation to precipitate its copper-content in the form of oxide, and to recover the free ammonia and any volatile ammonium salts, which are restored to the cycle



at the appropriate point; the volume so distilled preferably containing an amount of copper practically equal to the total quantity of copper extracted from the ore in the same cycle.

For clearness, the following terminology is used: The terms 'rich' and 'poor' and 'strong' and 'weak' are applied to the copper-content of the various solutions in the cycle, and the terms 'high' and 'low' are applied to the free ammonia-content of these solutions, all of these terms being of course merely relative.

The present process, in its preferred embodiment, involves an initial leaching operation with a solution which, in comparison with the solutions following it in the cycle, is richer in copper and preferably lower in free ammonia. A portion of the stronger effluent from

*Excerpt from U. S. Letters Patent 1,131,986.

the ore is subjected to distillation, this portion containing such an amount of copper that the quantity of dissolved copper in the circuit is maintained practically constant, that is to say, so nearly constant as to allow a repetition of the cycle; in other words, the quantity of copper recovered by the distillation is practically equal to that entering into solution from the given body of ore, the conditions being such, however, that this quantity of copper is derived from a relatively small proportion of the total volume of liquid traversing this ore. Under such conditions, it becomes practicable to use highly dilute leaching solutions, without the necessity of subjecting the total volume of solutions to a process of distillation in the course of each cycle. Following this initial treatment of the ore, it is subjected to the desired number of further extractions with solutions which are successively poorer in copper, the final solution being either water or a substantially barren solution or reject from the distillation. The second leaching solution, being poorer in copper than the first solution, is usually somewhat higher in free ammonia; and the succeeding solutions, herein for convenience termed 'washes', are not only poor or nearly free from copper but are also, preferably, successively lower in ammonia. The number of successive solutions or washes thus used will depend upon a variety of conditions as hereinafter mentioned.

The following is illustrative of the process as applied to the treatment of copper-bearing sand in successive batches or bodies of approximately one thousand tons, each batch being treated with four solutions, successively applied. For simplicity, the process will be described as applied to a single batch of ore, it being, of course, understood that in the practical application of the invention, it is not essential to adhere strictly to the precise cycle of operations described.

The four typical solutions, as applied to a sand assaying approximately ½% copper, in the order of their application to the sand, are designated and characterized as follows, percentages being by weight:

(1) First leaching solution: 0.5% Cu: 1.0% NH_3: 0.8% CO_2.

(2) Second leaching solution: 0.35% Cu: 1.0% NH_3: 0.8% CO_2.

(3) First wash: 0.01% Cu: 0.08% NH_3: 0.02% CO_2.

(4) Second wash: Water, or distillation reject containing only traces of copper and ammoniacal compounds.

It is of course to be understood that the compositions above given are illustrative only, and subject to some variation in accordance with the copper-content of the sand, and other circumstances. The first leaching solution contains ammonia, ammonium carbonate, and cupric-ammonium carbonate from a previous leaching operation. The other solutions, as well as the first leaching solution for subsequent cycles, arise in the course of the process in the manner later indicated.

A complete representative cycle involved in the treatment of a single batch of copper-bearing sand of the character specified is indicated graphically in the accompanying diagram.

Sand finer than 40-mesh, previously freed from slime by means of a Dorr classifier or otherwise, is run into a tank which for illustrative purposes may be 54 ft. in diameter by 12 ft. high. This tank should be covered, fitted with valve-controlled vents, provided with a false bottom of filter-cloth supported on a wooden frame and fitted with an overflow and with appropriate means for receiving and delivering the sand and the various solutions. The sand is run in with water in such manner as to be uniformly distributed. After one thousand tons of sand has been delivered to the tank, filling it with sand to a height of about ten feet, the water meanwhile overflowing, the excess water is removed by decantation and the sand drained to the surface. The first leaching solution is then led into the tank from above, the bottom valve opened, and the water displaced at as rapid a rate as filtration will permit. As soon as ammonia begins to appear at the outflow, indicating substantial displacement of the water, the lower valve is partly closed and the percolation rate adjusted as may be found necessary to secure a satisfactory solution of the copper-content of the ore. The first portions of the solution are found to be poor in copper and low in ammonia-content, owing to diffusion and imperfect displacement, and are run into the sump for the second leaching solution. Soon the first leaching solution, properly enriched in copper and now termed rich solution, appears and is permitted to flow to the rich-solution tanks for subsequent distillation. This rich solution is the richest portion of the effluent coming from the sand, and is ready for distillation. The volume of rich solution distilled for any one batch of sand is dependent upon the copper-content of the sand, and in practice will be, on the average, of a volume such that the copper-content of the rich solution distilled is practically equal to the copper extracted from the sand. The rich solution on distillation breaks up into copper oxide for the smelter, ammonia and ammonium carbonate for the second leaching solution, and a reject containing traces only of copper, ammonia, and ammonium carbonate; this reject may be used instead of water for the second wash, if desired.

As soon as the first leaching solution, amounting in all to some five hundred tons, has been run upon the sand and has reached the sand-line, the second leaching solution is run in, in approximately equal volume; and when this in turn has all reached the sand-line, the first wash is added, followed in the same manner by the second wash, the effort in all cases being to avoid mixing solutions, and to displace each by that next succeeding it in the cycle. The several effluent solutions are so manipulated as practically to maintain the proper composition balance, as between the chemical contents of the various solutions, a typical method by which this may be done being illustrated graphically in the diagram. There is thus established an equilibrium in the process, there being a regular progression of solutions in the following general manner: the second wash of charge N takes up

a little copper and becomes the first wash of charge N + 1; this in turn takes up a little more copper and receives the distillate and some dissolved copper from previous cycles and becomes the second leaching solution of charge N + 2; the free ammonia of this second leaching solution is partly used in dissolving copper, when it becomes the first leaching solution of charge N + 3, its copper-content having been fully oxidized to the cuprous condition; this first leaching solution having become saturated with copper by its passage through the sand, and having thereby lost its solvent power, is in part distilled, as before described, depositing its copper as 79% oxide, yielding its ammonia and ammonium carbonate as a pure product to join cycle N + 4 as a second leaching solution, and furnishing from its almost barren reject a second wash for a following cycle. In a plant containing more than one leaching-tank, these several operations are of course all going on at the same time, the total volume of solution in circulation being practically a constant: thus rich solution is continuously withdrawn from the leaching-circuit, and is replaced by an equal volume of second wash, less only the small volume of fresh ammonia and ammonium carbonate solution added to replace mechanical losses. In case the distillation is effected by free steam, the volume of solution is increased by its condensation, and a portion of the reject from the distillation, equal to the steam condensed, is thrown away in the course of each cycle.

The solvent power for native copper of these several solutions is of course dependent upon their content of cupric salts with the required proportion of ammonia; and theory indicates that a large amount of oxygen is required to convert the entire copper-content of the solutions to the cupric state. It has, however, been shown in practice that it is possible to accomplish this oxidation through the surface contact of the dilute solutions with the atmosphere, particularly after the process has reached the desired equilibrium, so that relatively large amounts of copper are being carried in solution. It is accordingly unnecessary, as a rule, in the regular operation of the process, to use any system of mechanical aeration of the several solutions. These are stored in covered tanks, with controlled vents, whereby air may be admitted as required. Means for injecting air under pressure may also be fitted both to the storage and leaching-tanks. It has further been shown, in practice, that whereas there is some appreciable adsorption of ammonia by the sand, even from solutions so dilute as those contemplated under the present invention, the adsorption of copper is practically *nil;* and the losses of copper are materially reduced by the employment, as described, of at least two leaching solutions, applied successively, the second leaching solution being poorer in copper than the first, and both solutions being highly dilute.

Obviously, the loss due to ammonia adsorption may be somewhat lessened by repeated washing, and it is possible and may be advisable to have a third wash following the second wash, the expediency of this being a commercial matter, entailing as it would an additional circuit of pipes, pumps, storage-room, and the like. So too the balance between the amount of rich solution distilled and second wash used is in part a commercial one, depending upon the cost of steam and the distillation loss, as against the recovery of additional copper and ammonia by more complete washing.

The present process is to be distinguished from processes depending upon the solvent effect of ammonia, with or without aeration: in these, the entire copper content of the effluent is derived from the ore, and it is obviously impossible to separate from any fractional portion of this effluent, less than its total volume, a quantity of copper equal to that dissolved from the ore. In other words, if a balance is to be maintained in successive cycles, the entire volume of effluent must be subjected to distillation or equivalent treatment for the recovery of copper. The present process is also to be distinguished from those depending upon a cupric salt for their solvent effect, and requiring precipitation from the entire volume of the effluent of a weight of copper equal to the increment derived from the ore. Such processes involve the regeneration of the total volume of the effluent, without providing a barren reject; hence, if a wash is used, it must likewise, at some stage of the process, be submitted to a precipitating operation, in order that it may be available for use as a wash in the succeeding cycles. In contra-distinction to these, the present process yields directly from the stronger portions of the effluent a greater or less proportion of barren reject, which is available as a wash, or which may be replaced by a like volume of water available as a wash: and the volume of liquor, to be distilled or otherwise treated for the separation of its copper, is limited to a portion only of the effluent instead of the total volume thereof. If the balance is to be rigidly maintained, the volume thus treated must of course contain an amount of copper equal to the increment derived from the ore; from which it follows that the volume to be distilled is smaller as the leaching solution, before application to the ore, is richer in copper. The present process, in its preferred embodiment, renders it practicable to employ an initial leaching solution relatively rich in copper, and thereby to reduce the volume of liquid subjected to distillation or equivalent precipitation method, to a comparatively small proportion of the total effluent: and the use of a second leaching solution relatively poor in copper avoids the necessity, which would otherwise exist, of using large volumes of wash in order completely to remove the rich solution from the ore. In other words, the second leaching solution, being relatively poor in coppor, combines to some extent the functions of a leaching solution and a wash; and to the extent that it combines these functions, it reduces the quantity of wash required.

THE PROMISCUOUS PLACING of 'safety-first' signs about mines, mills, and smelters has reached the point where it is of doubtful utility in many cases, according to *The Ingot*. Fewer signs, confined to the more dangerous localities, would seem to be more effective in impressing the desirability of the safety habit on all.

Choosing Rock-Drill Equipment

By P. B. McDONALD

Most mines possess rock-drills of several different makes, and some have a motley collection of drills perhaps none too well suited for the work in hand, usually purchased at various times without due regard for any standardization. Thus it is necessary to keep on hand repair-parts, from a half-dozen different drill manufacturers, that have a habit of getting mixed together on the warehouse shelves. A single mine may be driving with Sullivan and Ingersoll-Rand reciprocating drills, stoping with Cleveland, McKiernan-Terry, and Murphy hammer-drills, and sinking with some other make of plugger-drill; while there may be another variety or two of drill lying around the place, either going to rust underground or reposing in idleness in the corner of the warehouse, not used because some one cannot find a certain repair-part, or because a foreman has a prejudice against the type.

There is an excuse, of course, for getting the matter of rock-drills somewhat mixed, because there have been so many innovations in the design and construction of such machines in the past year or two that fashions in drills have changed almost as rapidly as in clothes. Newer and more efficient types of drills have constantly succeeded each other. The general tendency has been toward utilizing the hammer principle; first for up holes, as in overhead stoping; and then for down-holes, as in shaft-sinking by pluggers; and even for more or less flat holes in driving, as with the Leyner or new Sullivan mounted hammer-drill. Lighter, faster, and more automatic drills have also been sought. The heavy columns and bars for mounting drills have been replaced by lighter ones, which do not break a man's back to set up, or by none at all, as in the case of the stopers and sinkers. The future may see driving regularly accomplished by drills hung on a short rope or even held in the hands!

In picking out rock-drill equipment for a new mine, it is well to consider carefully a number of the newest models, and then to standardize on a type or types suitable for the three essentials of mining: sinking, driving, and stoping. It is, of course, necessary to know what kind of rock is to be broken. A mounted hammer-drill, such as the Leyner or new Sullivan, may be the best for a hard brittle rock, where clogging by mud in the bottom of the hole is not likely, and where the water principle through hollow steel is useful for dust prevention. For soft sticky rock such as slate, an old-fashioned reciprocating slugger type for pounding out results may give the best satisfaction in the end; in extreme cases even the declining tappet-valve drills may make up in sureness what they lack in speed. However, one or two of the newer light mounted drills can handle a wide range of rock; such as the butterfly-valve one-man machine that so startled operators a year or two ago. An auxiliary-valve drill, like the Sullivan high-speed, or the peculiar Holman that won its great name in South Africa, is also capable of wide use, since such a valve assures both quickness and certainty by its combination of the spool principle with the auxiliary tappet or ball.

The ball-valve machines have much to recommend them for ordinary average mining, where a combination of qualities is wanted, and the Chicago Pneumatic Tool Co. has seen fit to strongly feature them. For this same field the plain spool-valve drills are, and have been, very satisfactory. The Sullivan company has shown its faith in this type by sticking to it for many years; its later spool-valves are excellent in that they do not freeze readily, and are not so finicky as was the general case with spool-valves several years ago.

The foregoing refers only to mounted rock-drills, such as were used for all purposes around a mine until recently. Today mounted drills have their greatest field in driving, since stopers have superseded them for rising and overhand stoping, and pluggers for sinking. But they are yet an all-around drill, and in a small mine can be used to advantage for any purpose. On the other hand, I have seen several small mines that did all their work with a jack-hammer or two, making it do for all varieties of holes; while a stoper or ordinary hammer-drill can be utilized to do surprising things, as shown in the enlargement of the Rolling-mill shaft at Negaunee, working from the surface down by angle-holes from below. This is also illustrated by the many shifts to which a hammer-drill is turned in small mines, where it has been used for flat holes and driving. Stoping in some mining districts is still carried on with mounted piston-drills on tripods or bars, especially where the ore seam is at a flat angle, as at Birmingham, or where underhand stoping is performed in long 'rooms.' On the whole, however, no one doubts that hammer-drills have revolutionized stoping; as, to a smaller extent, plugger-drills of the jack-hammer type have revolutionized shaft-sinking.

An additional factor to consider in choosing rock-drill equipment is the type of labor that is available to operate and repair the drills. In some districts, it is impossible to get intelligent men, so that a drill requiring brains and judgment to make it go cannot be employed, even though it is a whirlwind at drilling when it operates. For a large mine with capable machinists and well equipped shops, specialized and freak drills can be tried, and often marvelous results attained, but for a small mine with none too good labor, a drill should be selected which will stand abuse and poor care, and will run fairly well anyway. Of the Wood drill it has long

been advertised that it can stand anything and still keep going, and most of the older types of drills possess the same comforting quality.

Some drills are finicky. They will drill very fast for a time, and then need nursing and humoring. The Leyner drill was formerly accused of this fault, but since the Ingersoll-Rand company has been manufacturing it, several improvements have been made that lessen the tendency. And it cannot be denied that in hard rock, with intelligent operators, the water Leyner is, like the old race-horse Maud S., a world-beater. Very likely other mounted hammer-drills will be put in the field, since the Leyner has demonstrated what can be done in that line, utilizing the scientific advantages of the hammer principle over the slugging or reciprocating method of punching hard rock. In fact, the new Sullivan mounted drill is much like the Leyner, being a 145-lb. machine of the hammer type with water attachment.

There are several other points of some importance to be observed in choosing a rock-drill, such as methods of lubrication, short-stroking arrangements, length of feed, and so on. But such details can best be decided by the man on the job to suit his own ideas on the subject, and no general principles are involved beyond common sense.

As to the various hammer or stoper drills of the unmounted air-feed type, I do not think there is so much difference. There are a number of good ones on the market. Their valves differ, some have spools, some butterfly, some ball valves, and some no valve at all, but practically all of them will hold a drill-steel fairly close to the face and hammer it "fast and furious." The McKiernan-Terry and the Cleveland Rock Drill Co. make an automatically rotated stoper (which saves the operator from twisting a handle back and forth), and it is prophesied that this improvement is likely to be adopted by other makers; but the labor of twisting a stoper is not so marked as was the case with a plugger-drill, where the workman has to feed the drill forward as the hole deepens. In the latter instance, the jack-hammer made a big hit by successfully introducing automatic rotation for pluggers and sinkers. With an ordinary stoper, compressed air from the air-line does the feeding, so that all a man has to do is to rotate by swinging a handle back and forth through a small arc.

As with stopers, so with pluggers or sinkers, there are a number of good makes on the market, and it is not so necessary to exercise careful judgment in the selection. It is not meant to imply that some stopers and pluggers have not certain advantages over others of their class, but such advantages (aside from automatic rotation of pluggers) are usually merely mechanical details which appeal to one superintendent and not to another. Thus it is a question of personal conviction, more than a matter of principle, whether a stoper has ordinary or reverse feed, whether it weighs 55 or 100 lb., whether a plugger rotates by the reciprocating energy of the hammer or by a separate small engine. Such matters can be best decided by the superintendent on the job to suit his own ideas and the details of the situation. It need only be said that the automatically rotating plugger is a surprisingly satisfactory drill for shaft-sinking or down-holes in general. Such machines are the Ingersoll-Rand jack-hammer, the Sullivan rotator, the McKiernan-Terry rotating plugger, the Cleveland 'mucker', and others. Hollow drill-steel is generally used for blowing out the rock-chippings by air or water. Other things being equal, having selected a stoper or plugger-drill, it is good practice to standardize the type for its own class of work in order to simplify the repair-parts problem. A large mine will probably require three kinds of rock-drills: mounted drills (either reciprocating or hammer type) of one-man or two-man style, for driving and all-around work (including perhaps stoping); stoper hammer air-feed drills for rising and overhead stoping; pluggers for shaft-sinking and block-holing.

One of the signs of the times is the fish-pole mounting for the Sullivan rotator, which permits that plugger-drill to be used for driving and all-around drilling. This is a sort of Jacob's staff steel rod on which the rotator can be hung quickly and conveniently for drilling short horizontal holes in soft rock. All the foregoing remarks are merely personal observations (on a subject in which it is difficult to get unbiased views) from experience in several mining districts. By no means have I tried to discuss all the different makes of rock-drills, and some very good ones I have not even mentioned. It might be pointed out that rock-drills sell for not far from a dollar a pound, but some of them are worth it.

Conditions of the Chilean Nitrate Industry

The average monthly production of nitrates in Chile from January 1 to August 1, 1914, was 5,404,729 quintals of 101.4 lb. Since August 1 the production, in quintals, has been as follows: August, 4,830,233; September, 2,856,600; October, 2,865,494; November, 2,659,875; December, 2,428,759; January, 1915, 2,082,549.

Wages in the nitrate fields have gone down 25%, but falling exchange has increased by 40% the cost of imported articles used in the reduction of nitrates. The Government has assisted in sustaining 70% of the output, but one company refused assistance in paper money worth 14c., as exchange might go back to 18c. plus, and payment be demanded at the higher price, causing the loss of all profit. Its production was 200,000 quintals per month. On August 1, 1914, there were 134 plants in operation. On February 1, 1915, there were 40, some of which were working half time. The nitrate on hand in Chile (24,000,000 quintals) is enough to supply the market for a year if monthly sales are not increased. On December 31, 1913, the supply on hand was 10,000,000 quintals.

Freights to Europe have lately been $17.63 per 22 quintals (2231 lb.). Sales are expected to Scandinavia, Spain, and Italy. Except in the United States and Great Britain, the demand is in excess of the supply, but vessels are scarce. The price on the Chilean coast is $1.38 to $1.40 per quintal—*Commerce Report.*

On Carnotite Deposits—and the Rand Banket

By CHESTER T. KENNAN

Any metal or mineral carried in solution may, under suitable conditions, be precipitated or deposited interstitially in sand or sandstone, or other porous or loose-grained rock; or such deposition may take place through replacement by mineral matter of easily soluble cementing material between the grains. Such orebodies are impregnation deposits, and may be primary or secondary in their character. From which it follows that the inducted minerals may also be of primary or secondary nature.

The fundamental agencies for the production of such primary deposits are: A fissure or subterranean water-channel carrying mineral-laden solutions at an opportune period; a loose-grained, porous, or otherwise easily permeable, wall-rock for the mineral solutions to impregnate.

The extent and richness of such deposits depend primarily upon the amount and richness of the solutions; the duration of time the mineralizing action continued; the degree of porosity of the rock mineralized; the amount of pressure exerted upon the mineralizing solutions; and, sometimes, upon the number of fissures, or water-channels, contributing to the same deposit. Naturally, the more porous and more easily permeable the rock, and the greater the pressure exerted upon the mineralizing waters, the more extensive and wide-spread the deposit will be. It is not infrequently the case that waters from disconnected and widely separate fissures meet and mingle, forming a continuous ore deposit between the fissures.

In case the pressure exerted upon the mineralizing waters is slight, and the rock not easily permeable, the mineralization is likely to take place only close to the producing fissure; but in the case where the rock is easily permeable, and inclined downward away from the fissure, the solutions may permeate the rock for a long distance. Eventually this deposit, by leaching and percolation, may become entirely disconnected from the parent fissure, and be re-deposited in an isolated position, clearly as a secondary deposit of this class—such are many of the carnotite and copper carbonate deposits in sandstone.

Another case may be quoted in which the ore deposit appears to be isolated from any distinct water-channel, where a deposit has occurred in loose or almost uncompacted sand, or weakly cemented sand; and by subsequent pressure and cementation the feed-fissure or producing plane of weakness has 'healed' so perfectly that evidence of its prior existence at that spot is wholly lacking. In many other instances, however, where the fissure was even slightly faulted, although now quite perfectly 'healed' and cemented, the 'drag' of the grains of sand along the plane of weakness is beautifully in evidence. A fine example of such an effect is found in the now famous Lady Belle silver mine on Horn mountain in Eagle county, Colorado.

In many instances, when feed fissures were 'capped,' or closed above the point of ore deposition, the mineralizing waters were forced into the porous rock or sand under enormous pressure; in this case the orebodies are apt to be richest near the feed-fissure, fading gradually in richness with distance from the feed-fissure. There are many ways by which fissure-vents become capped or obstructed: shale in the path of a narrow fissure will not 'fissure,' but merely 'shingle' or 'telescope,' leaving an obstruction in the channel impervious to the flow of water or steam. The latter effect may be modified in some cases by faulting. The opening of a narrow fissure through a thick stratum of clay, under pressure of overburden at depths in the earth, is likely to heal quickly, forming an impervious barrier. On the sides of a mountain, the strata frequently slip, or slide, on bedding-planes or planes of unconformity, and thus may cap whole series of fissures for many miles at once. A similar effect is accomplished by the intrusion of igneous sheets on bedding-planes and planes of unconformity; and by surface lava-flows. Nature has numerous ways whereby she caps, closes, or obstructs fissure-vents. The cumulative effect of the pressures attained may well be presumed, in instances, to have even caused volcanic explosions or earthquakes.

Mineral-laden waters, whether under subterranean pressure, or not, migrate, often long distances, through all kinds of water-channels in the earth's crust, as fissures, fractures, cracks, bedding-planes, joint-planes, slip-planes, planes of unconformity, lines of weakness, and through water-channels carved out by themselves along lines of easily soluble material.

That, in places, the resulting deposits may have been enriched, or have received some contribution, directly or indirectly, from surface erosion by the medium of descending and laterally moving waters through the aforementioned water-channels is admitted; but the Mother Goose theory, advanced by some eminent geologists, to the effect that the minerals formerly existed in infinitesimal particles in the surrounding country, and such particles took wing and flocked to a common house, is rejected as too fanciful.

While the foregoing principles are enunciated with special reference to ore deposits of gold, silver, lead, copper, carnotite, and other uranium and radium minerals found in the sandstones and conglomerates of the United States, they are no less applicable to any spot in the earth's crust where similar conditions have pre-

vailed, as, for instance, the copper mines on the Kirghese steppes, Siberia; many mines and deposits of this class in Bolivia; the copper mines in the conglomerate of the Lake Superior region; and the Rand banket.

Such ore deposits may be found in any sedimentary formation, where the prescribed conditions have prevailed.

Near Mauch Chunk, in Carbon county, Pennsylvania, carnotite deposits occur "in a 40-ft. layer of coarse-grained conglomerate lying near the base of the Pottsville formation (Pennsylvania) and just above the red Mauch Chunk shale (Mississippian)," so says U. S. Geological Survey Bulletin No. 580-H.

Deposits of this class have been observed sparingly in the Maroon (Carboniferous), in the red sandstone of the Red Beds (Jurassic), and more frequently in the white sandstone near the top of the Red Beds, these white strata being essentially identical in structure and composition with the white sandstone formation superimposed upon the Red Beds, and doubtless received their sedimentation from the same general area.

The Copper King mine in southern Routt county, Colorado, is an orebody of this class occurring in ancient quartzite and conglomerate of the Cambrian system. The Cambrian is here about 400 ft. thick, the orebody being near the top of the series. The nearest outcrop of igneous rock is about one mile to the north. About one and a half miles to the south, and higher in the geological column, is a fragment (at least 4 square miles in superficial area) of a thick sheet of lava. This impregnation deposit, as far as explored, uniformly occupies about 8 to 9 ft. thick of strata dipping approximately 20°. The orebody has been cut to a depth of 425 ft. by an inclined shaft, and also by about 400 ft. of drifts from the inclined shaft, all the workings being in ore continuously. Numerous 'knife-blade' feed-fissures intersect the deposit, but, as far as observed, none are prominently faulted. Partly owing to the softness and porosity of the rock at the time it was intersected by the feed-fissures, these fissures are now very narrow—frequently 'tight.' It is to be remarked that feed-fissures in this class of ore deposits are now rarely more than an eighth or quarter of an inch wide, and seldom filled with vein-matter. They are quite uniformly so small and inconspicuous that when obscured by the dust, powder-soot, and mud of a mine, they are commonly passed unnoticed, unless special search is made for them. Presumably they may have been somewhat wider at the period of ore-deposition, but by subsequent pressure and gravitational adjustment the walls have now been brought closer together. The valuable content of this ore-deposit is chiefly copper carbonate and chalcocite, with subsidiary amounts of native copper, red and black copper oxides, silver and galena.

In Colorado, New Mexico, Utah, and Arizona the thousands of such mineral deposits nearly all occur in the sandstone series lying between the Red Beds and the Dakota sandstone. Whether this intermediate series here constitutes the top of the Jurassic or the base of the Cretaceous is a mooted question. In the central-western part of Colorado it is called the Gunnison; on the eastern portion of the mountains, the Morrison; and in the northwestern part of the State, where it is much thicker, it is divided into the Flaming George and White Cliffs; while in the southwestern portion of the state, where it is approximately 1500 ft. thick, this series is divided into two portions named respectively the McElmo and La Plata, the latter being the lower member, and nearly always containing these carnotite deposits, when found in this geological province.

Carnotite and other vanadium and uranium minerals in commercial quantities (excepting pitchblende) are practically always found in ore deposits of this class, and, in the four states mentioned, most frequently in the lower portion of this series. At Horn Mountain and vicinity, the immediate geologic section (reading upward) is Red Beds for about 1000 ft. thick, Gunnison about 250 ft., Dakota about 350 ft., Ft. Benton Shale about 200 ft.; and lying upon Dakota sandstone, about a mile northeasterly from the mines, is a large section of the lava-sheet that at one time extended over the whole region. Aside from this lava the nearest outcrop of igneous rock is Porphyry mountain, some three miles southeast. The mines and productive formation on Horn mountain are seamed with a network of 'knife-blade,' 'tight,' and 'healed' fissures—many of them faulted, some intensely faulted. The main orebodies occur in the sandstone strata from 25 to 50 ft. above the top of the Red Beds, though sometimes 'leachings' of mineral extend down to the Red Beds. The chief minerals here impregnating these sandstones are silver sulphides, chlorides, bromides, native silver, and carnotite, with subsidiary amounts of copper carbonate, native copper, copper vanadate, and gold.

The foregoing principles and illustrations serve, incidentally, to account for the mineralization of the Rand banket, without recourse or reference to the irrelevant sophistries that have been published in the technical press.

COPPER PRODUCTION of Austria in 1913 was as follows, according to a consular report from Vienna: Of 32 works for producing copper ore, 10 mills, with 26 overseers and 753 workmen, were in operation in Austria in 1913. About 163,533 quintals (quintal = 2.2046 lb.) of copper ore, valued at 1,542,296 crowns ($313,086), was produced. In this output, which shows a decrease of 5.76% compared with the preceding year, the government mines furnished 2.36% and the mines under private ownership 97.64%. The mills produced 36.845 quintals of metallic copper, valued at 5,986,409 crowns ($1,215,241). Copper works controlled by the mining authorities produced, besides copper, speiss and copper regulus, 8966 quintals of copper vitriol, valued at 514,970 crowns ($109,806). The entire production of the province of Tyrol, 95.36%, is controlled by the government, and the full yield of the province of Salzburg, 4.64%, by private works.

CONCENTRATES

Readers of the Mining and Scientific Press are invited to ask questions and give information dealing with technical and other matters pertaining to the practice of mining, milling, and smelting.

Recovery at the Detroit smelter, Arizona, in 1914, averaged 95.45%. Copper in slag was 0.35 per cent.

Tuff comes from the Italian *tufa*. Vesuvius is responsible for the nomenclature of many volcanic products.

Cost of a horse-power year at the Copper Queen smelter in 1914 was $54.789, on a daily average of 4092 hp. developed.

Hornstone is a dark flinty veinstone; the mineralogical equivalent is 'chert.' The latter is Irish, and originally meant 'pebble.'

Peat-fuel containing upward of 60% moisture is being used in a by-product recovery power-gas plant near Osnabrück, Germany.

Krennerite is a telluride of gold, resembling calaverite as regards composition, but differing from it in possessing a perfect cleavage.

The Welcome Stranger nugget was found at Moliagul, near Dunolly, Victoria, in 1869. It weighed 2280 oz. and was valued at $47,670.

Nuggets are water-worn pieces of native gold. The term is restricted to pieces of some size, not mere 'colors,' or minute particles. Fragments and lumps of vein-gold are not called 'nuggets,' for the idea of alluvial origin is implicit.

Wind action, or aeolian agency, is manifest in the shallow cemented deposits from which much gold has been obtained in Western Australia. Such deposits are the product of wind and rain, assisted by gravity acting on a slightly inclined surface.

Recovery of metals by water concentration at the Broken Hill South mill in 1914 was 76.7% lead, 54.9% silver, and 10.6% zinc; but adding the recovery from the zinc concentrate by flotation, the total extraction was 89.2% lead, 83.9% silver, and 84.4% zinc.

China clay imported into the United States amounts to about 300,000 tons per year. Of this, 25% is used in ceramic manufacture (pottery), the remainder being consumed in the paper, bleaching, and other industries. There are a number of deposits of commercial value in this country.

Repair cost of storage-battery locomotives at the Bunker Hill & Sullivan mines runs from $0.00359 to $0.01189 per ton hauled. Trolley locomotives cost from $0.00435 to $0.00641 per ton. In the first instance the highest expense was up to $55.456 per month, and with the other machines $93.912 per month.

Wheelbarrows or trucks are employed to some extent in practically every industry. Their use should not lead to accidents, yet many workmen are injured when handling such equipment. Some accidents occur because the wrong kind of barrow or truck is used for handling certain materials, or because the barrow or truck is of weak construction or in poor repair; some injuries are caused by the lack of handle guards for the protection of the workmen's hands, or by unsuitable floors, pathways, or runways over which the barrows or trucks are wheeled. For the most part, however, injuries received by workmen when handling barrows and trucks are caused by their own carelessness. Wheelbarrows should be selected carefully for the specific work that they must perform. There is a right barrow for every task, and usually the right one is the safest one.

A correspondent asks for a rapid and accurate method of determining the amount of tin in ore or gravel. The dry assay of tin ore is only to be recommended for works purposes, mines, or prospectors. It is not accurate enough for buying and selling, but should suffice to give a good idea of the value of the material in the district where our correspondent is situated. The cyanide assay is of the most general applicability, and is as follows: grind the ore through a fine screen, say 80 mesh, and weigh out 10 grams. Also weigh 40 grams of coarsely-powdered commercial cyanide. Mix half with the ore, place in a clay crucible, and cover with the remainder. Fuse the mixture at a red heat for 15 to 25 minutes, pour into a mold, and detach the tin button from the slag. The weight of the button $\times$ 10 represents the per cent of metal in the ore, when 10 grams is taken. The crucible may also be taken out of the fire when fusion is complete, allowed to cool, broken, and the tin detached. When the ore contains much ferric oxide, it should be digested with strong hydrochloric acid, provided the tin is present as cassiterite (tin oxide), and if much pyrite is present it should be evaporated to dryness with nitric acid, before extraction with hydrochloric acid. The cleaned sample is then washed with water, dried, and assayed. The sample should, of course, be weighed before treatment with acid. The cyanide used must be free from sulphates and sulphides, otherwise the result will be low. The assay charge should be as free from gangue as possible, otherwise there will be loss by slagging. This may be prevented by taking a larger sample and panning it down before assaying.

REVIEW OF MINING

As seen at the world's great mining centres by our own correspondents.

BUTTE, MONTANA

General Recovery.—Power Schemes.—Anaconda's Reduction Plants.—Butte & Duluth Affairs.—Anaconda-Pilot-Butte and Butte & Superior.—Elm Orlu Suits.—Montana Phosphate.

The continued good prices for copper, and the high price of zinc have resulted in Butte's mines and mills returning to nearly normal scale of operations. Of course, the zinc properties have been running full time for some months, but the copper mines that suffered curtailment last summer are just beginning to put on full crews again, and to ship somewhere near the normal amount of ore to the mills and smelters. The only large property that has not yet re-opened is the East Butte. This will shortly re-open, however, with a milling and smelting capacity greater than ever before.

The business men of the community are quick to respond to the revival of mining; the general impression being that Butte is now having good times, with a promise of still better things. This should not be interpreted, however, by miners away from Butte, as indicating that the labor supply is insufficient, for throughout the winter there have been many idle men waiting for the chance, which they now have, to secure employment.

The railroads are undertaking some improvements and new construction, particularly the Chicago, Milwaukee & St. Paul, which is spending large sums in the electrification of its main line from Harlowtown, Montana, to Avery, Idaho. Large numbers of men are employed in connection with this work, and it is predicted that the electrified division between Three Forks and Deer Lodge will be ready for traffic before the end of the year.

The Montana Power Co. is also expediting its hydro-electric installation at the big falls of the Missouri, near Great Falls, and Thompson Falls on Clark's fork in the western part of this state. These industrial undertakings, together with the increased farming activity, augur well for the business outlook and general prosperity of Montana for the coming year.

In this same connection it should be mentioned that the Anaconda company has re-started its reduction plant at Great Falls, and that some ore is now being shipped there for smelting. Also at Great Falls the company has begun the installation of a large electrolytic refinery, to cost approximately $2,000,000. At this plant most of the copper now sent to the eastern refineries will be refined and cast into bars for shipment to the various points of consumption. At Anaconda the changes in the reduction works are frequent, and of great importance. For instance, the reduction plant to treat the slime by the Laist leaching process has been cast aside in favor of a flotation process. This change will also mean the ruthless abandonment of the recently installed and much praised 20-deck round tables, as they will not be needed in connection with the flotation plant. The Laist leaching process, however, will be used in connection with the enormous tonnage of tailing that has accumulated below the mill in the past dozen years. In connection with this leaching process, the first unit of the sulphuric acid plant of 100 tons per day is nearly ready for production.

But the news is not all favorable. The Butte-Duluth Mining Co., with its copper-leaching plant east of Butte, has been meeting with difficulties, financial and otherwise. The company has been placed in the hands of a receiver, and bankruptcy proceedings have recently been instituted by creditors of the company. The troubles of the company are not all public information, but it is safe to say that the chief one has been in connection with the attempts to evolve a favorable method of leaching the oxidized ores, and electrolytically precipitating the copper thus dissolved. In spite of rumors to the contrary, it is now well known that the Anaconda company did not exercise its option on the property, for reasons variously given, but probably in connection with the results obtained in the diamond-drilling that tested the orebodies. Those responsible have not yet given up hope of its successful outcome, and expect to see some return for the $750,000 spent in the enterprise.

The litigation between the Anaconda and the Pilot-Butte companies over the apex to orebodies is still dragging along, without any definite decision in favor of either side. A recent phase of the case was the citing of the Pilot-Butte company into court for contempt in connection with the extracting of ore from certain ground from which both litigants had been restrained from working. The Court decided

CLAIM MAP OF BUTTE.

that the Pilot-Butte was in contempt, and imposed a nominal fine, together with a warning against the repetition of the offense.

The apex controversy over orebodies between the Butte & Superior and Elm Orlu is assuming definite shape, and apparently is coming to trial before long. A formidable array of technical talent has been reserved by both sides to present the evidence in support of their various contentions. On the side of the Elm Orlu are the following experts: Walter Harvey Weed, Horace V. Winchell, J. F. Kemp, John D. Irving, and F. T. Greene; while for the Butte & Superior are gathered John W. Finch, Walter H. Wiley, Rollin D. Salisbury, W. H. Emmons, W. L. Creden, F. A. Linforth, and A. L. Longley. Because of the expense to the litigants, it is to be hoped, of course, that this litigation will not be long drawn-out, but from the standpoint of the disinterested onlooker the trial should be worthy of attention, because of the brilliant array of talent to be pitted against each other on the witness-stand. Such a gathering of witnesses reminds

one of the olden days in Butte when the Heinze trials were on. The best engineers from all over the country were gathered together to testify. A peculiar phase of this present litigation lies in the fact that ex-Senator W. A. Clark, who is probably the largest individual stockholder in both enterprises, is interested in both sides of the case. In other words, it would seem as if he were being made to bring suit against himself, and pay handsomely for the privilege.

The activity of the U. S. Geological Survey in prospecting and valuing the phosphate resources in Montana has resulted in arousing the interest of some private capital in the development of the phosphate industry. A company has recently been formed to develop phosphate deposits near Philipsburg, Montana. The company is securing local capital with the intention of erecting a mill at Philipsburg for grinding phosphate rock, and selling it raw as a fertilizer throughout the state, and elsewhere. The outcome of such an enterprise will be watched with much interest, because it has been considered a question whether the western states were yet ready or in need of a fertilizer, and also whether the raw rock would satisfactorily answer such needs as do exist.

TORONTO, ONTARIO

Power at Porcupine and Cobalt.—Dome Directorate.—Hollinger Mine Development.—Cobalt Companies.

Shortage of power has seriously interfered with operations at Porcupine, as well as at Cobalt, and lately the companies, with the exception of the Dome and Hollinger, which have special arrangements with the power company, have only been receiving half their usual supply. Most of them have auxiliary steam plants which have been started, although this considerably increases the cost of production. Fortunately the difficulty over power shortage cannot be of long continuation, as the spring floods will shortly relieve the situation.

The Dome, the monthly returns from which have lately been somewhat of a disappointment, owing to the low grade of the ore treated, took a sharp upward turn in the share market on the election of J. R. De Lamar to the presidency to replace Ambrose Monell, who has occupied that position since its organization. This and other changes in the board were accompanied by a report that the shares would be placed on a dividend basis.

At the Hollinger, work has been started on a winze from the 800-ft. level of No. 1 vein for 125 ft. where another level will be opened. The vein is strong at 800 ft., and of good average grade for the 200 ft. so far opened. The main Hollinger shaft, now down 550 ft. is being sunk to connect the workings at 800 ft. At the Acme, development is under way at the 675-ft. level, and the shaft is down 40 ft. below that depth. A station will be cut at 800 ft., from which level a cross-cut will connect with the central main shaft of the Hollinger through which all ore will eventually be hoisted. The Acme output is now supplying 20 of the Hollinger stamps, and will provide ore for the additional 20 stamps which should be in operation early in April.

Nearly all the annual reports of Cobalt companies show considerable reductions in ore reserves. The Temiskaming has greatly improved its position by following up the vein entering from the Beaver on the 500-ft. level. This vein has been again cut at 460 ft., 30 ft. from the Beaver boundary, where it is 7 in. wide, assaying 3500 oz. per ton. The annual report of the McKinley-Darragh shows a production of 1,396,540 oz. of silver, being the smallest output since 1906. The cost of production shows an increase from 22.33c. in 1913 to 31.33c. in 1914. Total estimated ore reserves were 2,132,000 oz. as against 3,210,000 the previous year. The report was not hopeful as to the likelihood of further important discoveries. The net profits were $307,652 and dividends were paid amounting to $404,584.

PLATTEVILLE, WISCONSIN

Review of Conditions Affecting Zinc-Ore Production.—District Yields of Ore.—Prospecting, Development, and Leasing Activity.

A careful survey of operations and production of zinc ore in the Wisconsin districts for March reveals conditions full of promises to be realized several months hence. With high prices for metal all the month the natural deduction would seem to warrant a much increased extraction of raw ore from mines. Bad weather and bad roads militated, so the operators stated, against the free delivery of ore to railroads. This was true enough, but bad weather can interfere little with underground work, except where delays might follow as a consequence of floods, and in this respect the spring break-up and rains worked no damage at least in the Wisconsin field.

The month opened with spelter at high prices, both spot and future ruling strong, and on an almost equal footing. Speculators through the metal exchanges upset reasonable calculations by precipitating quotations which erroneously reflected the true condition of the actual markets, and large consumers of spelter charged manipulation with a display of intense feeling, which quickly restored the quotations to a more satisfactory standing. A large amount of business was transacted both for domestic and export consumption of spelter. The sales of domestic requirements called for a large tonnage of prime western spelter for delivery over the next three or four months, while substantial orders were filled for export. As far as known, most of this business was done by one concern. A careful investigation of the market showed that many prominent producers of spelter have nothing to sell from April and May production, and most of these are in the same position regarding June. Producers were so well sold ahead that there is no chance for weakness to be displayed in the metal markets for months to come.

St. Louis quotations ruled at 9 to 10c. most of the month, with the actual returns nearer to the higher figure prevailing most of this 30-day period. Sheet zinc continued at the highest price ever known to the industry, $13.50 per cwt., f.o.b. Illinois points, less 8% discount in car lots. Brass special could not be obtained in quantity at all, and one or two spot deliveries of small lots were traded in at 12 cents.

Ore production was under normal, and it is this fact coupled with the further fact that future deliveries are entirely dependent on material yet to be recovered from the ground that portends trouble for smelters in the near future. Prices for zinc ore opened at the beginning of the month at $60 to $70 for 60% metal content. These prices suffered a severe slump part of the month, the range at one time running below $50. While no tentative agreement exists among miners to curtail production, it appears manifest to the close observer and to the discriminating mind, that a bond of secret fellowship was working through mysterious channels among operators to curtail production. This holds true for nearly all of the prominent zinc-ore producing regions of the country, not alone in this section. All of the elemental factors comprised in the big game played between buyers and sellers seem alert to every phase of excited as well as extraordinary conditions, and no opportunity is lost to secure every possible advantage to be derived from high prices. Under the influence of figures never dreamed of before it would appear that a considerably increased output should be in evidence. Miners are not displaying any anxiety to boost production, and it is quite clear they propose to get all they possibly can for the material yet to come out of the ground while metal markets remain high. The usual ratio for the selling price of ore is figured on a basis of 8 to 1. The average trend of prices during March conveyed a ratio of 6½ to 1, and miners freely acknowledge that they

are not at all satisfied with the offerings being made by buying representatives of smelters.

Deliveries of ore for the month were reported as follows: Benton, 7,886,000 lb. zinc, 209,390 lb. lead, and 1,224,730 lb. pyrite. Galena, 3,820,000 lb. zinc; Hazel Green, 2,678,000 lb. zinc, Livingston, 2,670,000 lb. zinc; Cuba, 2,350,000 lb. zinc; Platteville, 2,130,000 lb. zinc; Linden, 1,280,000 lb. zinc.; Harker, 688,000 lb. zinc; Shullsburg, 366,000 lb. zinc; Dodgeville, 66,000 lb. zinc; and Mineral Point, 50,000 lb. zinc; making a total of 23,984,000 lb. zinc; 203,930 lb. lead, and 1,224,730 lb. pyrite.

The gross production of raw ore from all mines for the month aggregated 19,778,550 lb., and net refined ores from separating plants and from mine direct to smelter 14,398,370 lb. The reserve of zinc ore in the district at the close of the month was 2500 tons. Several million pounds of lead ore was carried over.

Boom conditions are in evidence all over the region. Prospecting has received great impetus, and mine development is well under way in all the districts. Drilling companies are being organized, and scores of new mining associations have been recorded. Leasing is in great demand, and every available mineral tract has been conserved for mining purposes. An insistent demand for miners, machine-men and shovelers exists throughout. At several points shovelers are receiving as high as 17c. per can of 1000 lb., and earning from $3 to $5 per day. Numbers of miners' cottages are being built to accommodate the influx of men being brought into southern parts of the area.

LORDSBURG, NEW MEXICO

New Concentrating Plants in the Pinos Altos District.—Chino, Eighty-five, Cossack, and Calumet & Phillipsburg Companies.

In the Pinos Altos district, Grant county, nine miles north of Silver City, work has been commenced on two concentrators. One is being built at the Cleveland mine by the Empire Zinc Co. It will have a capacity of from 100 to 200 tons of ore per day, and in it will be incorporated some form of the electrostatic or magnetic separation process for sulphide zinc ores. The other mill is under construction by the Pinos Altos Mining & Milling Co., recently organized by Stauber, Wright, and Cadelle, operators of the Pacific No. 2 and other Savannah Copper Co. properties, and the Langston mine. The concentrator is being built on the site of the old Gilette mill, adjoining the Gilette mine. The ore is heavy in zinc sulphides and is most valuable in gold, silver, and copper. It is understood that several different concentration processes will be used in the mill, principally the electrostatic method. Stauber and Wright have made thorough investigations as to the best method of treating their complex ores, and it is thought they have arrived at the correct process. Lack of successful milling facilities has been the greatest obstacle to progress in this district. The plant may be in operation by June 1. Custom ores will be treated. The Empire Zinc Co., after extensive tests, has decided on the construction of its mill, and has recently completed a narrow-gage mule tramway from the mines to the Santa Fe railroad near Silver City. The erection of these two plants give evidence of renewed activity in the Pinos Altos district.

The Chino Copper Co.'s addition to its power plant is progressing well. Additions are being made to the flotation plant. The result of flotation tests on the Santa Rita ore have been satisfactory, and the Company will give further attention to this method.——The Eighty-five mine at Lordsburg has been closed down for about a week on account of a broken crankshaft on the main hoist. An electric hoist has been ordered to replace the gasoline equipment.——At Bland, Sandoval county, the Cossak Mining Co. is operating its stamp-mill and cyanide plant with good results.

NEW YORK

Business Revival in New York.—Miami and Inspiration.—Rio Tinto.—Alaska Juneau Finances.—United States Smelting and Alaska Ebner.—Exploration Company of London.

It has been years since Wall Street has seen such reversal of form as took place this week. The depression has been so heavy and for so long that it was hard to shake it off. The copper issues have not been slow; they could hardly hang back with the metal market as strong as it is. If the present higher range of prices and increased activity takes on the wished-for appearance of continuity it will not be long before there will be consolidations among copper properties that will interest the public.

Already there is some talk, following persistent advertising campaigns of Miami and Inspiration, that these two properties are to be joined financially, as they are physically. The former has just resumed its quarterly dividend payments. Some of the rumors about the Inspiration have been based

SHAFTS, POWER-HOUSE, CRUSHING-PLANT, ORE-BINS, AND HOUSES AT THE INSPIRATION.

on the shareholding of the Anaconda. This company owns 150,000 Inspiration shares. The possible absorption of Inspiration may be on a share-for-share basis.

Rio Tinto has suffered by reason of war conditions. It would be a natural first thought that this property, practically owned by French and English capital, would have been one to profit by the abnormal demand for copper as used in munitions of war. Its profits in 1914 were only $3,687,000, against $7,789,500 in 1913. It is an odd commentary on commercial conditions that mines here should be getting back to normal with all possible haste, while a mine in Spain with such controlling interests, can run but four days per week without piling up metal that cannot be sold.

The Alaska Juneau deal is to go through, but the market fireworks, which promised to flare up so bright, have all been effectually dampened. Four hundred thousand shares of stock are to be allotted to an underwriting syndicate. It is said that this has already been subscribed several times over. The capital stock of the Juneau is being increased from $150,000 to $15,000,000 by changing the par value from 10c. to $10 per share.

The United States Smelting, Refining & Mining Co. is defendant in an action in the United States court to compel the surrender of a large block of stock of the Alaska Ebner Gold Mines Co. which it is alleged to have received from the bondholders' committee under an agreement which is now attacked as being unfair. The plaintiffs are heirs of the late Edwin P. Hatch. Some other certificate-holders are associated with them for the purposes of this action.

The Utah Consolidated becomes a substantial holder of Anaconda by reason of the sale of the International Smelting & Refining Co. to that company. Utah owned 5000 shares of

International, which is now replaced by 16,500 Anaconda shares. Utah Consolidated made over $500,000 profit in 1914, which is good for a property that has been spoken of as worked-out. It has been a gold mine, a copper mine, and a lead mine in turn, and still has ore in reserve for another year's operation.

The Exploration Company of London must look on the Tomboy as something of a life-saver. The mine made a profit of $29,535 during March. The mill treated 12,000 tons of ore from which bullion was shipped worth $43,500, and concentrate valued at $44,000. There never was a better illustration of the idea of the holding company in mining operations. While all of the operations of the Exploration Company in Mexico have been seriously interrupted or stopped, the Tomboy is running smoothly and carrying the load until the closed mines can be re-opened. If we are to have a real period of expansion in mining enterprise, it is to be hoped it will come along the lines of development in this direction, rather than attempted exploitation of single properties. If the organization of development companies is made along the right lines, the industry can have greater public support of the right kind than it has ever had in this country.

DENVER, COLORADO

BRIGHTER OUTLOOK FOR MINING IN THIS STATE.—NOTES ON CRIPPLE CREEK MINES.

The mining business in Colorado looks better today than it has for several years. There is a better feeling among mining men generally; mining engineers report more inquiries, if not more work, for and about mines, than at any time within ten years. This may be accounted for in several ways. New and important strikes in different parts of the state, the high price of zinc, the surplus of money in banks, and lack of other legitimate enterprise.

In Cripple Creek all the principal mines, with one or two exceptions, have found large bodies of good-grade ore in their deepest workings, from 1500 to 2000 feet.

The Portland is looking as well, or better, than at any time in its history. Large bodies of ore, running from 1½ to 3 oz. gold per ton have been opened up at 1800 feet.

The Vindicator and Golden Cycle are both shipping high-grade ore below 1600 ft. The Vindicator bought the mining claims of the Golden Cycle, an adjoining property, in March of this year, for $1,300,000, for which it gave notes for $35,000 each, payable every 30 days; instead of paying these notes monthly, it is paying one every week, and taking all the money out of the Golden Cycle mine. The company will pay its usual dividend of 3c. per share per quarter on the 25th of this month.

The Isabella company is working more than 50 sets of leases, besides doing considerable work on company account. This company also is in a better financial condition today than it has been for 7 or 8 years.

The Granite, formerly the Gold Coin, is sinking the main shaft below the 1200-ft. level, and shipping a good grade of ore. About two months ago this company bought the Dead Pine holdings, which was adjoining ground; an apex suit that had been started was settled by the purchase.

The old Independence is still pegging away, but not doing as well as it did in 1900, when in 30 days it produced over $600,000. The company is still paying dividends, however, most of which come from milling the old dump.

A new plant has been installed on the El Paso, and work has been started on the extension of the Roosevelt adit, the waste from which is hoisted through the El Paso shaft.

A 100-ton cyanide mill is being erected on the Jerry Johnson. The Cresson has produced over $1,000,000 in the past three months, from a pear-shaped cave or vug; this vug, being 23 ft. long, 13 ft. wide, and about 40 ft. high, is still shipping picture ore. This was probably the richest orebody of its size ever discovered at Cripple Creek. The vug was found on the 1200-ft. level and the vein has just been cut on the 1400, or 200 ft. below, where it shows good ore.

That the grade of the Cripple Creek output is improving is indicated by the reports of the mills and smelters, particularly of the Golden Cycle mill, which treats about 65% of the total ore shipped out of the district. Their statement shows the average value of the ore treated in 1913 to have been $16.25 per ton; in 1914, over $19 per ton; and for the first three months of this year, over $25 per ton, and last month this mill treated 29,000 tons of ore, averaging $48 per ton, amounting to $1,392,000, which is a record production for the plant. The total production of the district for March was about $2,000,000, details of which appeared in the *Press* of April 10.

HOUGHTON, MICHIGAN

MARCH COPPER OUTPUT.—SCALE OF OPERATIONS.—ISLE ROYALE AFFAIRS.—ANNUAL MEETINGS.—WHITE PINE.

The demand for Lake Superior copper appears to continue without any prospect of decrease. Production in March is estimated to have been at least 4,000,000 lb. more than in February. Homer A. Guck estimates the March output at over 20,000,000 lb. These figures approach the maximum production of the copper country. If the increase can be maintained, April should set a new record. This great yield is directly due to the European war. The mines and mills are doing their utmost to supply the demand. Some of the mills operated every day in March, including Sundays. The Centennial-Allouez mill worked five stamps every day. The Mass Consolidated mill is working three shifts. The Mohawk-Wolverine mill is working at full capacity. More men are being added to the working forces at the mines and mills, and wages have been raised. The wages of the men working on tribute at the Winona have recently been increased. Substantial advances have been made in the prices of nearly all the copper shares. People in the copper country are showing renewed interest in buying shares.

At the annual meeting of the Centennial Copper Co., the directors were re-elected with the exception of Quincy A. Shaw. He is succeeded by Walter L. Frost.——At the annual meeting of the White Pine Copper Co. the directors were re-elected with the exception of Quincy A. Shaw. He is succeeded by John M. Longyear.——At the annual meeting of the Cliff Mining Co. the directors were re-elected excepting Quincy Shaw and T. N. Perkins, who are succeeded by Randolph C. Grew and W. E. L. Dillaway.

In a recent letter to shareholders of the Isle Royale, Dana de Cordova criticizes the management. He also calls attention to the issue of an injunction enjoining the Calumet & Hecla from voting its shares, or employing proxies of other shareholders in election of directors for the Isle Royale, who are, or are intended by the C. & H. to be at the same time directors or officers of the C. & H. The shareholders are asked to consider whether they are being benefited by having their property tied up with managers having larger interests. Mr. Cordova asks whether the C. & H. management is more than a delusion. Michigan holders of Isle Royale shares do not agree with Mr. Cordova.

It is reported that the mill at the White Pine mine was tested last week. The first shipment of 'rock' from No. 3 shaft will be made before the end of April.

The Houghton Copper Co. will build a railroad-spur to its mine. It is stated that there are 10,000 tons of rock on the dumps at the mine. Arrangements have been made with the Calumet & Hecla to crush it.

Construction work at the new Isle Royale mill is being rushed. It probably will be June before the mill is in operation.

THE MINING SUMMARY

The news of the week as told by our special correspondents and reflected by the local press.

ALASKA

The route of the United States Government railroad in Alaska was made public in Washington, D. C., on April 10, and the Department of the Interior made the following statement:

"Commencing at the town of Seward on the westerly shore of Resurrection bay, thence following along said westerly shore in a northerly direction to the head of said bay; thence following up the drainage of Salmon creek to a summit between said drainage and the drainage of Snow river; thence following the drainage of Snow river to Kenai lake; thence continuing northerly along the easterly shore of Kenai lake, along Falls creek, along the shores of Lower and Upper Trail lake and up Trail creek to a summit in the Kenai mountains near Mile 45 from Seward; thence descending along the drainage of Placer river to the head of Turnagain arm of Cook inlet; thence following the northeasterly shore of said Turnagain arm and crossing Portage creek and Twenty-mile river to the mouth of Kern creek, near Mile 71 from Seward; thence in a northwesterly direction along the shore of Turnagain arm to near the mouth of Big Rabbit creek; thence leaving Turnagain arm and running northerly to a 3 west, Seward meridian; thence running northeasterly to

near the end of Knik arm of Cook inlet; thence running northerly across the flats at the head of said arm and crossing Knik and Matanuska rivers to a point about two miles north of the Matanuska river; thence running in a westerly and northwesterly direction, crossing the little Susitna river and following along the southwesterly slopes of Bald mountain to Willow creek, a tributary of the Susitna river; thence in a northerly direction following the drainage of the Susitna and Chulitna rivers to Broad pass, situated in the main Alaska range of mountains; thence crossing Broad pass and entering the drainage of the Nenana river; thence continuing northward, following the drainage of the Nenana river to the Tanana river; the total distance from Seward being 416 miles, more or less. Also, starting from a point on the above described line situated two miles, more or less, northerly from where said line crosses the Matanuska river, and thence running in an easterly direction, following the drainage of said Matanuska river and its tributaries, a distance of 38 miles, more or less, to the Matanuska coalfields."

The route includes the existing Alaska Northern line, which runs from Seward through the Kenai peninsula for a distance of 71 miles to Turnagain arm. This road will be purchased at a cost of $1,150,000. Construction will be carried on under contract, and is to start as soon as possible.

In one of the orders signed by the President, the Alaska Engineering Commission, of which W. C. Edes is chairman, was instructed to look after the health of the men at work, and to adopt a system of compensation for accidents similar to that in force on the Panama Canal. The proposed lines will cost about $26,800,000.

On April 1 the house of representatives of the territorial legislature recommended for passage Bill 48, submitted by the committee on mining and manufactures, an act supplementing the mining laws of the United States in their relation to Alaska. The new mining bill amends the Roden law, enacted by the first legislature, in regard to assessment work. It declares that assessment work shall be done on only one claim of an association group, where it is shown that such work is development and improvement of the entire group. The bill further cuts down the fees hitherto paid recorders, providing $1.50 fees for recording one claim, and 25c. for each additional claim named in the group. On March 29 Senator Charles A. Sulzer introduced in the upper house of the legislature a memorial asking Congress to establish a school of mines at Juneau, under the provisions of an act recently approved by President Wilson.

The Alaska Gastineau company is to construct another dam near Sheep creek to increase its supply of electric power. The first unit of the mill is described on page 612 of this issue.

ARIZONA

Gila County

The report of the Ray Consolidated company for 1914 shows that in the mine at Ray, Pinal county, development totaled 75,261 ft. Work in future will be at a decreased rate, as the mine is now well opened. Reserves are estimated at 74,765,789 tons averaging 2.214% copper. The smelter at Hayden, Gila county, produced metals worth $7,597,723. The net profit was $2,359,623. Dividends paid were $1,089,322.

In the well being put down near Roosevelt by the Tonto Basin Oil Co., a strong flow of gas has been encountered at 1000 ft. Oil is expected at any time.

The annual report of the Old Dominion company at Globe may be summarized as follows: All construction work started in 1912 was practically completed in 1914. Total yield of metals was copper 30,210,361 lb.; silver, 148,459 oz.; and gold, 3308 oz. The gross revenue was $2,674,205, and profit $978,509. Dividends paid were $445,500, against $810,000 in 1913. The surplus at the end of the year was $967,292, compared with $1,193,247 at the beginning.

CALIFORNIA

Amador County

A description of the dam built by the Kennedy company to store tailing from its mill appears in *Western Engineering* for April. The structure is known as a multiple-arched dam, and was designed by John S. Eastwood. It is 455 ft. long, 30 ft. high, contains 1233 cu. yd. of concrete, and up to the 50-ft. contour, the ultimate height, its capacity is over 16,000,000 cubic feet.

Calaveras County

At the Royal mine at Hodson ore extraction has been started and the mill is partly ready for treatment.

Eldorado County

The property of the Larkin Mining Co. is to be sold to the highest bidder to pay its indebtedness.

Kern County

Additional machinery is arriving at the Gold Peak mill and cyanide plant in the Caliente district to increase the output. A. T. Copley is in charge.

Modoc County

Little has been heard from the High Grade district for a considerable time, and interest is given the place by the Modoc Mines Co., which is to sink to 500 ft. and drive a drainage and transport adit to connect with the shaft. A hoist, compressor, aerial tramway, and mill are to be installed. N. E. Guyot is manager for the William Wrigley interests of Chicago.

Nevada County

An incline shaft sunk in 1870 has been found in the bed of Wolf creek, close to the Golden Center of Grass Valley mine. This probably accounts for the water flowing on the 500-ft. level of that mine, being fed by the creek. The old timbers in the shaft are well preserved.——In the suit of Giuseppi Damiano v. the Birchville Mining Co. for $25,000 damages, the jury, on April 8, awarded him $12,000. The plaintiff was injured in the company's mine on May 13, 1913.

Shasta County

A 100-ton fume-control plant using the Heslewood process is to be erected by the Balaklala Consolidated Copper Co. at Coram.——The Trinity Copper Co., whose property adjoins the Balaklala, has appointed Frank M. Leland, of the latter, as its general manager.——Ten men have been sent from Kennett by the Mammoth Copper Co. to its Spread Eagle mine, which has been closed since August, 1914.——The 10-stamp mill at the Uncle Sam mine was re-started last week after being shut down for two years.

Siskiyou County

(Special Correspondence.)—The Isabella Copper Co. has let a contract to Charles McCoy and B. Keyser for driving 100 ft. The management has planned extensive work for the summer. Emmett E. Rader is superintendent.——Good ore continues to show in the Commodore mine, on Barkhouse creek, recently taken under bond by H. J. Barton and associates of Oak Bar. It is probable a small mill will be erected soon.——Arrangements are being made for the re-opening of the King Solomon mine, near Cecilville, under new management.——Six stamps are dropping at the Conzetti mine, in the Cecilville district, and late developments have been encouraging. In the shaft a vein 11 ft. wide is being opened, and attention is also being paid to three other veins from 4 to 8 ft. wide. The ore being milled is said to yield over $40 per ton.——Rich gravel has been uncovered in the Freshour Bar property by Nelson Bros. of Gottville, operating under lease. At a depth of 62 ft. the channel has been exposed for a width of 150 ft., and has an approximate depth of five feet. Numerous small nuggets and coarse gold have been taken out, one nugget extracted soon after the strike being valued at $175. It is the first rich find made in the district this season,

and much interest is shown by owners of neighboring mines A. S. Calkins, of Etna Mills, is heavily interested.——Placer mining along Klamath, Scott and Salmon rivers, and their tributaries, is decidedly active this season, a result of late rains and deep snow in the mountains. An abundance of water for summer sluicing is indicated. All the large properties are operating full-handed. ——An option has been taken on the Sugar Hill mine by Charles E. Eberline, superintendent of the South Fork hydraulic mine at South Fork. Operations will commence within a few weeks. Work has been resumed at the South Fork with a full crew engaged.

Etna Mills, April 5.

COLORADO

Clear Creek County

Lessees in the Mendota mine are producing a good tonnage of zinc and lead ores, especially the former. The mill, operated by Stephens Bros., is yielding three tons of zinc and one ton of lead concentrate per day.——Bruce, Brandstetter, Hummer, De Masters, Mottshall, Harper-Nelson, and Convery-McClusky, individual leasing companies in the Capital mine, are all getting satisfactory returns.——Three feet of copper-gold-silver ore has been opened in the Waldorf in East Argentine. A 20-ton lot averaged about $81 per ton.——Steady work is under way at the Virginia City, Seven-thirty, Mineral Chief, Centennial, and Onondaga companies' properties.

Eagle County

The geology and ore deposits of Red Cliff are described by A. H. Means in the January issue of *Economic Geology*. Much attention has of late been given to the deposits of Leadville, particular interest being shown as regards the relation of fissure veins to blanket deposits in that district. At Red Cliff the conditions of deposition are similar to Leadville, and, as at Leadville, there are fissures and blanket deposits. At Red Cliff, however, it was possible to determine the relation of the fissure veins to the blanket deposits, and it is this point which is the item of principal interest in the following paper.

The Red Cliff or Battle Mountain district (altitude 8600 ft.) is situated in the southeastern part of this county, about 20 miles north-northwest of Leadville and 75 miles south of west from Denver. The district lies on the Pacific slope 12 miles northwest of Tennessee pass (altitude 10,229 ft.) on the continental divide, and comprises the towns of Red Cliff and Gilman, which have a combined population of about 400. Red Cliff is the railway station for both towns and is on the main line of the Denver & Rio Grande. The town of Red Cliff is situated in the bottom of Eagle River cañon, while Gilman lies on the shoulder of Battle mountain, 3½ miles distant.

During 1904 to 1912 Eagle county, of which Red Cliff is the principal district, produced 143,749 tons valued at $2,502,387. Previous to 1904 no exact statistics are available. During the '80s and '90s many properties were producing regularly, and the output before 1904 must have been larger than from 1904 to 1914.

The ore deposits of the district are confined to a relatively small area, the largest part of which lies in the cañon of the Eagle river between Red Cliff and Gilman, a distance of about 3½ miles. The deposits may be divided as follows: (1) fissure veins in the granite carrying principally gold and silver with some copper, lead, and zinc; (2) replacements in the quartzite consisting of zinc-blende and galena bodies, also narrow veins carrying gold and silver; and (3) replacements in the limestone comprising large bodies of zinc-blende and considerable deposits of chalcopyrite and pyrite. In the oxidized zone a little carbonate of zinc is mined.

The Bleak House mine is at present entirely in the quartzite, and consists of an adit which is in 900 ft. along the strike of the vein to the end-line of the property. The point of great interest in this mine is the continuation of a fissure vein from the granite into the overlying quartzite, the dip changing sharply from 55° northeast in the granite to vertical in the quartzite. The Rocky Point, Ground-Hog, and Champion mines have extensive workings. The Rocky Point is situated on the side of the cañon in the quartzite, while its workings penetrate into and under the Iron Mask, which is in the overlying limestone. The Ground-Hog and Champion are about three-quarters of a mile south of the Rocky Point, though in the same horizon as the latter. Another deposit of considerable interest, situated in the quartzite just a short distance south of the Ground-Hog, is known as the Black Iron. This property could not be visited because the entrance is badly caved and on that account a first-hand description cannot be given. The most important mine in the camp, the Iron Mask, is in the limestone, together with other properties of lesser importance. It has been operated steadily for about five years, producing in the neighborhood of 100 tons of ore per day. The ore is raised along a single-track incline to the surface and is then carried to the mill in the bottom of the cañon by an aerial tram. The mill, somewhat enlarged from its original capacity, now treats about 100 tons per 24 hours. The treatment consists of roasting in shaft furnaces, followed by magnetic separation and wet concentration by tables. The ore mined on the Iron Mask property is principally zinc-blende, which occurs in a gangue of recrystallized dolomitic limestone. The ore is accompanied by galena, pyrite, and, to a less extent, chalcopyrite. The next mine of importance in the limestone is the Belden, the deposits being similar to the Iron Mask.

VIEW OF EAGLE RIVER CAÑON, RED CLIFF, COLORADO.

The origin of the deposits may be briefly summed up as follows. First theory: (1) The deposits in the limestone were derived from the overlying porphyry, the minerals being carried into the limestone and replacing it through the agency of the magmatic solutions exuded from the porphyry. (2) The deposits of the 'quartzite ore horizon' in the quartzite are due to the reaction of the ascending magmatic waters with descending waters which resulted in general deposition and zone of sericitic alteration. (3) The fissure veins in the granite owe their ore to ascending alkaline solutions, which upon entering the quartzite deposit rich ore. They are later than the blanket deposits. Second theory: (1) Both limestone and quartzite orebodies are the result of one period of mineralization. The ore-bearing solutions ascended from depth, deposited at the quartzite ore horizon due to the peculiar favorability of this horizon to precipitation. They then continued upward without further deposition till the porphyry was reached, this later acted as an impermeable barrier and caused further precipitation; and (2) the fissure vein de-

posits resulted from the precipitation by ascending alkaline solutions, which upon entering the quartzite deposited rich ore. They are later than the blanket orebodies.

LAKE COUNTY (LEADVILLE)

The long expected pumps for the Penrose shaft of the Down Town scheme have arrived, and their installation is under way. Repairs to the shaft timber are complete.——The zinc smelter is almost ready to resume.——Two large oreshoots have been opened in the St. Louis adit in the Big Evans district. The Third Venture Mining Co. has this property under lease in charge of Fred Johnson. On No. 1, 2, and 4 levels $30 to $40 ore is now being mined. Fourteen men are employed.

SAN JUAN COUNTY

It is reported that the Garfield Smelting Co. has leased the Silver Lake mill to E. W. Waybright and others for use as a custom plant. An oil-flotation process is to be installed which will increase the recovery.——Operators of the Ledge, Gold King, Sunnyside, and Frisco mines are busy.

IDAHO

SHOSHONE COUNTY (COEUR D'ALENE)

The report of the Federal Mining & Smelting Co. for 1914 shows that 21,091 tons of ore was shipped to smelters, and 389,450 tons was treated in the local mills. The former averaged 34% lead. The concentrate shipped totaled 35,967 tons, and with the crude ore averaged 44.67% lead and 16.01 oz. silver per ton. There was also shipped 4200 tons of zinc ore assaying 44.61% metal. On account of the metal market the Morning mine at Mullan was closed for some months, while the properties at Wardner were curtailed. This resulted in development only amounting to 7256 ft., against 16,224 ft. in 1913. Ore reserves in the various mines total 988,450 of milling and 48,640 tons of shipping ore, a slight decrease. Dividends paid amounted to $5 per share on the preferred shares, totaling $599,305. A contract has been made with the Montana Power Co. to supply electricity, which will save about $50,000 per year.

At 900 ft. the east drift of the Hypotheek has been extended 320 ft. The face shows 24 in. of galena, also some carbonate ore. On the 700-ft. level the shoot is 532 ft. long.——It is probable that the Frisco mill will re-start in a week or so. The new process includes water concentration, flotation, and magnetic separation.

MISSOURI

FRANKLIN COUNTY

A modern 10-stamp mill and cyanide plant is to be erected by E. B. Whitworth and his brothers on their claims near Catawissa. The ore is low-grade.

JASPER COUNTY

Activity throughout the Missouri-Kansas-Oklahoma district has been halted somewhat by reason of the declining market, and a good many operators are marking time so far as new developments are concerned. The weather continued bad during the week ended April 4, however, but it is thought that with the arrival of good weather there will be a decided increase in production.

MONTANA

BEAVERHEAD COUNTY

It is reported that Salt Lake City and Butte people have acquired the old Golden Leaf mines at Bannack. The price paid was about $200,000. A large tonnage of ore is ready for treatment, and a mill is to be erected.

MADISON COUNTY

Options are being secured on certain gravel areas near Twin Bridges. In 1914 a Californian syndicate did some drilling there, but stopped after a few weeks' work.

SILVERBOW COUNTY

The North Butte company is operating at about 70% normal capacity. Cross-cutting is under way at 3000 ft. from the Granite Mountain shaft to cut the Edith May vein. At 2800 ft. this vein shows high-grade ore.——The report of Paul Gow, superintendent of the Pilot-Butte mine, shows that development in 1914 amounted to 2642 ft. The Pilot shaft was sunk from 2090 to 2420 ft. Stations were also cut. The middle vein at 2200 ft. was opened for 275 ft., 75 ft. of which was high-grade zinc ore from 2 to 8 ft. wide. At 2400 ft. this shoot assays 15% zinc and 4 oz. silver per ton. In sinking the shaft the bornite vein was discovered in cutting the station at 2400 ft. It is from 8 to 10 ft. wide, the shoot being from 2 to 7 ft., and averages 5% copper and 5 oz. silver. At 2400 ft. the Gow vein was opened for 210 ft., and 110 ft. on the 2200-ft. level. The Glance vein has been opened for 130 ft. at 2200 feet.

Work has been resumed at the East Butte mine, which has been closed since last August. The mill started on April 15, and the smelter will be blown-in on April 20. About 500 men will be employed. Oscar Rohn is general manager. The monthly output will be about 1,250,000 lb. of copper. During the shut-down the plant was overhauled.

Silverbow county had a population of 72,500 people on March 1, 1915.

NEVADA

ESMERALDA COUNTY

It is reported that litigation over apex rights at Goldfield may be settled at an early date.

The annual report of the Atlanta Mines Co. shows that operations in the last year cost $86,937. Of this, $13,000 was the cost of new pumping equipment. Development was practically confined to the 1750-ft. level. The Goldfield Consolidated has leased the south half of the Grizzly Bear claim, below 1400 ft., to the Atlanta company; this is a satisfactory arrangement.

The report of the Pioneer Consolidated Mines Co., operating 50 miles south of Goldfield, for 1914 shows that 8000 tons of $6 ore was treated by 10 stamps, a 6-ft. Huntington mill, and cyanide plant. Total costs were $2.68 per ton. Most of the ore came from the Bonanza stope and the 250-ft. level. It is proposed to treat the slime which is being stored.

HUMBOLDT COUNTY

Rich gold ore has been discovered in the Honey Bee claim of the Finland property in Finland cañon, 9 miles northeast of Lovelock. The owners are Y. M. Ward, H. E. Downey, and A. Beneditti. A rush has commenced.

NYE COUNTY (TONOPAH AND MANHATTAN)

Eight mines at Tonopah produced 10,913 tons of ore valued at $222,394 during the week ended April 10.——Development in the Tonopah Mining Co.'s claims totaled 503 ft., mostly in the Sand Grass.——The Extension shipped $65,725 worth of silver, concentrate (35 tons assaying $300 per ton), and slag.——At 700 ft. in the Wandering Boy claim of the Jim Butler 8 to 12 ft. of good ore is being broken-down.——Stoping at 1230 ft. in the Merger is yielding $60 ore.——The Belmont company reports as follows for the quarter ended February 28: revenue from products, $666,474; net income, $324,942; dividend on April 1, 187,500; resources, $1,425,440.

At Manhattan, Mushett and Wittenberg have ordered a crusher large enough to break sufficient ore to keep the tube-mill in continuous operation. A revolving trommel will be installed in place of the grizzlies now used to separate the oversize from the fine material that is treated. Cost of open-cut mining and the simple milling process is only about 45c. per ton.——High-grade ore has been cut by Pace and Yerick in a quartz lease of the Merger company——It is rumored that the Big Four is to resume work.——The Rakestraw lease of the Nevada Mining & Development Co. has started producing ore.

PERSONAL

James F. Kemp is expected at Butte.

J. E. Bamberger is in San Francisco.

W. H Emmons was at Butte last week.

R. J. Grant, of Denver, is in New Mexico.

Herbert E. Colliran has returned to Denver

L. C. Trent, of Los Angeles, called at this office.

John S. Colliran is expected from Korea on May 3.

John T. Glidden, of the Cerro de Pasco, is at Boston.

Charles Butters will soon return from Cobalt, Ontario.

A. Stanley Elmore is on a visit to New York, from London.

R. A. F. Penrose, Jr., was at Denver early in the month.

Charles T. Kirk is inspecting mines at Kelly, New Mexico.

David Keith, of Salt Lake City, was in San Francisco during the week.

R. D. Salisbury has been at Butte in connection with mining litigation.

A. R. Weigall sailed from London for Japan, by way of Suez, on April 10.

Norman C. Stines is expected in San Francisco shortly, to spend the summer.

Llewellyn Humphreys passed through San Francisco on his way to Plumas county.

R. C. Sticht has been elected president of the Australasian Institute of Mining Engineers.

Philip Argall sails from New York by the *Adriatic* on April 21 on his way to London.

George D. James, of Napa, California, is at Auburn, Placer county, on professional business.

K. C. Parrish is returning to the United States for a holiday after two years in Colombia.

J. T. Dixon has been detailed to make an inspection of the Crown Mines, at Johannesburg.

William Spence Black is now superintendent of the Mobile mine in the Goodsprings district, Nevada.

Robert T. Hill is making a survey of southern California, under contract with the U. S. Geological Survey.

E. C. Morse is in charge of the mill at the Valperazo mine at Dolomi on Prince of Wales Island, in southeastern Alaska.

Elwood Mead, who has been director of irrigation in Victoria, Australia, has resigned, and is returning to fill a position in the United States.

J. S. Douglas, Walter Douglas, Charles Sumner Smith, and Waldo Smith were at Globe recently to make a formal inspection of the Old Dominion mine.

W. P. Hammon, Newton Cleaveland, George L. Huntress, J. B. Thomas, R. E. Paine, and O. W. Smith have been visiting the dredges of the Yuba Consolidated Gold Fields company in Yuba county.

J. F. Mitchell-Roberts has resigned his position as chief engineer to the Wilfley Mining Machinery Co. of London, to take up private work. He will be absent from London for about nine months.

John Palmer Cosgro, formerly general manager in Mexico for the Mine & Smelter Supply Co., has accepted a position as chief engineer and general manager of sales, for the Wilfley Machinery Co. in London.

William J. Ninness, for eight years head mining captain of the Mass Consolidated Mining Co., was found unconscious in a skip at the 11th level of B shaft at eight o'clock on the morning of March 30. Captain Ninness had a fractured skull and died at noon without any explanation of the accident. He started underground in a skip with a new drilling-machine, which he intended to test. It is believed that he fainted and fell into the bottom of the deep skip in such a way as to fracture his skull.

Spelter Prices in 1914-1915

Spelter production and prices are the subject of a U. S. Geological Survey bulletin prepared by C. E. Siebenthal. The unprecedented and spectacular rise in the price of this metal in January and February of 1915 has caused the statistical position of spelter to be examined as never before. Stocks and great demands for export served to augment the deep interest in the metal. The production of primary spelter increased from 346,676 to 353,049 tons. The consumption was

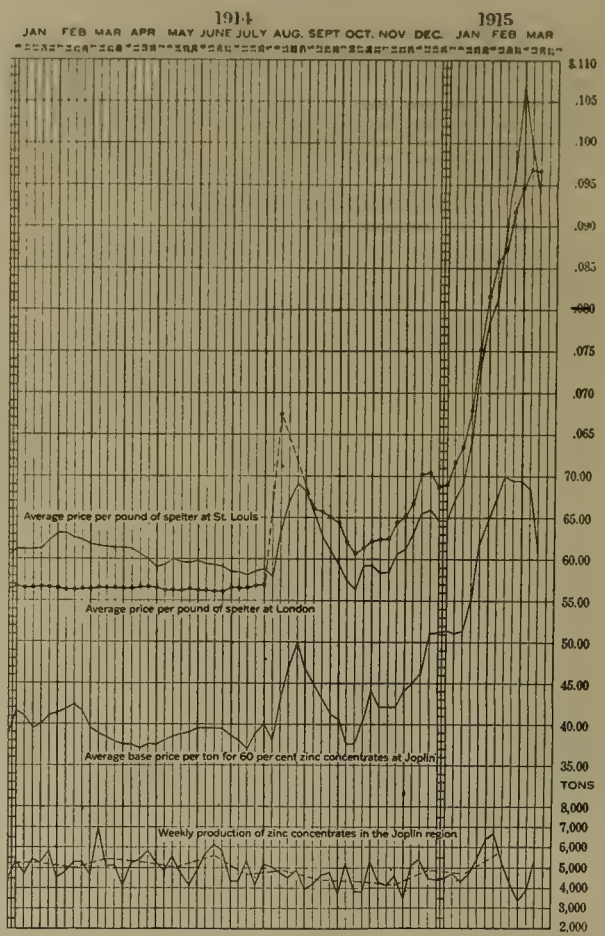

DIAGRAM SHOWING AVERAGE WEEKLY PRICE OF SPELTER AT LONDON AND ST. LOUIS; OF 60% ZINC CONCENTRATE AT JOPLIN; AND WEEKLY PRODUCTION (SALES) OF ZINC CONCENTRATE IN THE JOPLIN REGION IN 1914-1915. THE BROKEN LINE SHOWS THE WEEKLY SALES, AVERAGED BY MONTHS.

299,130 tons, compared with 295,370 tons. Production of secondary metal decreased from 53,748 to 46,415 tons. Owing to the great exports of spelter, and the domestic consumption, it is probable that the demand in 1915 will amount to 594,000 tons. This, however, is not the maximum possible quantity to be required. Taking all sources of supply into consideration, if the United States is called upon to supply say 600,000 tons, the metal will be probably at hand without increasing the mine production above normal, to contribute nearly 560,000 tons of this quantity. The remainder can be produced easily from domestic sources. It is possible that high prices may so limit domestic consumption as partly to offset the advantage gained from the increased foreign demand.

THE MARKET PLACE

Weekly Summary of Metal Prices and Notes on the Markets.

Metal Prices

San Francisco, April 15.

Antimony	25 —25¾
Electrolytic copper	16½—16¾
Pig lead	4.40—5.40
Quicksilver (flask)	$80.00
Spelter	10¾—11
Tin	15 —16½
Zinc-dust, 100-kg. zinc-lined cases	15

EASTERN METAL MARKET

(By wire from New York.)

NEW YORK, April 15. Copper is strong and advancing, lead quiet, and spelter firmer.

SILVER

Below are given the average New York quotations in cents per ounce, of fine silver.

Date.		Average week ending	
Apr.	8 50.25	Mch. 3	49.02
"	9 50.12	" 10	49.81

While the silver market is steady, there is little tendency to go higher. India is not supporting the market much. Exports from London to the East up to March 25 amounted to £1,480,500. In that period of 1914 the value was £1,677,000; China and the Continent have given a little strength. On April 10 about 350,000 oz. left San Francisco for the Orient. The Nipissing company is shipping a good deal of metal to New York instead of London. This is the result of increased insurance rates on bullion across the Atlantic. The Calumet & Hecla and Quincy copper refineries forwarded 36,568 and 13,868 oz. respectively to New York last week.

LEAD

Lead is quoted in cents per pound or dollars per hundred pounds, New York delivery.

June	30.72	....	Dec.	33.60	....

Prices in New York on April 15 varied from 50 to 60c. per pound. The Vulcan Detinning Co. reports sales amounting to $195,009 for the first quarter of 1915. The profit was $26,658. Business showed a fair increase, due to an improved market. During its financial year ended February 28, the Cornwall Tailings Co., England, made a profit of £8000, against £16,900 in the previous period. From 143,216 tons of tailing 432 tons of black tin was recovered.

COPPER

Prices of electrolytic in New York, in cents per pound.

Date.		Average week ending

June	13.60	....	Dec.	12.75	....

Exports of copper during the week ended March 27 totaled 22,503,362 lb. Of this, England took 6,102,769; France, 3,767,021; Italy, 6,571,652; Sweden, 4,822,991; and Norway, 770,585 lb. From August to February inclusive, the total exported was 369,073,376 lb., against 556,968,115 lb. in that period of the previous years.

According to a consular report from Santiago bids for sheet copper for government railways close on April 24.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average weekly and monthly quotations, in dollars per flask of 75 lb., are given below:

Week ending			
Mch. 17	80.00	Mch. 31	80.00
" 24	80.00	Apr. 7	80.00
		" 14	80.00

Monthly averages.

	1914.	1915.		1914.	1915.
Jan.	39.25	51.90	July	37.50	....
Feb.	39.00	60.00	Aug.	80.00	....
Mch.	39.00	78.00	Sept.	76.25	....
Apr.	38.90	....	Oct.	53.00	....
May	39.00	....	Nov.	55.00	....
June	38.60	....	Dec.	53.10	....

The quicksilver market is dull. Some sales have been made at $80 per flask. One New York concern quotes $65. London reports £12, or $57.60.

ZINC

Zinc is quoted as spelter, standard Western brands, St. Louis delivery, in cents per pound.

On the previous page of this issue is a chart prepared by the U. S. Geological Survey showing spelter prices to March 20, 1915. The output of metal in 1914 was 353,049 tons. Domestic consumption was 299,130 tons. Exports totaled 64,029 tons of domestic production. Stocks at December 31, 1914, amounted to 20,095 tons. Exports in January and February, 1915, were 30,597,854 and 29,203,018 lb. respectively.

COMPANY REPORTS

MYSORE GOLD MINING CO., LTD.

This Company operates at Kolar, state of Mysore, India, and the report of the superintendent, R. H. P. Bullen, covers the year 1914. With plans it occupies 78 pages, and contains many interesting notes, as follows:

There were 167 Europeans, 111 Anglo-Indians, and 8992 Indians employed during the period. Development down to 3226 ft. amounted to 26,249 ft., a decrease of 1082 ft. compared with that in 1913, due to power shortage in March to June. Total rainfall was 17.66 in. The average number of machine-drills working was 94.8 per month. Ore reserves are estimated at 1,014,000 tons, also 250,000 tons of low-grade material which will eventually be milled. Work in McTaggart's and the southern part of Ribblesdale's sections of the mine was mostly in low-grade ore. In the north part of the latter area, rich quartz was opened on No. 13 level, and a winze below the level was sunk 312 ft. on ore 5 ft. 6 in. wide, assaying 2 oz. 17.9 dwt. per ton. No. 14 levels north and south were driven from the winze to open this shoot, and exposed 127 ft. worth over 2 oz. for 4 ft. 9 in. width.

The stamp-mill crushed 304,375 tons of ore averaging $14.75 per ton. Waste sorted out amounted to 61,250 tons, or 16.75% of the tonnage sent to the sorting floors. By amalgamation there was 81.22% saved. Tailing leached totaled 261,734 tons assaying $2.63 per ton, consuming 0.44 lb. cyanide and 0.07 lb. zinc per ton treated. A 500-ton slime plant started in October, and slime treated in this and the test plant totaled 44,874 tons, averaging $2.60 per ton, using 0.69 lb. cyanide and 0.16 lb. zinc per ton. The total output was 212,381 oz. fine gold.

The gold yield was valued at £899,498. Royalty to the Mysore government amounted to £54,049. The total expenditure in India and London was £363,245, and profit £488,859. Dividends amounted to £213,500. The balance from 1913 was £176,885, and carried forward to 1915, £150,729. Costs were 16.64c. per ton lower than in 1913.

GOLDFIELD CONSOLIDATED MINES COMPANY

The report of this well known company for the year ended December 31, 1914, contains a great deal of interesting information, and items of cost and other data will be abstracted for other issues of this journal. Briefly, the year resulted as follows:

The property produced 338,192 tons of ore, of which 332,750 tons of an average gross value of $12.57 was milled, and 5442 tons of $29.01 was shipped. The gross value of this tonnage was $4,340,786. Deducting metallurgical losses, smelter discounts, and the cost of ore purchased, a total of $414,438, the sum realized amounted to $3,926,348. The expenses, including mining, milling, transportation, construction, taxation, and general expenses were $2,091,124, leaving a net realization from operation of $1,835,224.

The total operating expenses were reduced from $6.34 to $6.02 per ton, a difference of 32c., and the net operating expenses from $6.28 to $5.91, a decrease of 37c. per ton. This result would be satisfactory if a uniform reduction in costs had appeared in all the individual items, but an analysis of the figures shows increases in some of the costs and decreases in others. Increases are noted in stoping, milling, dump moving, and general expense; while decreases appear in development, total mining, concentrate treatment, total milling, and freight and treatment on ore shipped. The increased cost of stoping, 10c. per ton, is undoubtedly due to the larger proportion of ore obtained from re-working old stopes. During the last month of the year stoping was commenced in three new blocks of solid ground, which should aid in checking this tendency to increase during the coming year. Milling costs rose slightly during the summer when a larger percentage of dump ore was being treated. It was not so easy to treat as ore fresh from the mine, due to its poor settling qualities. The larger percentage of dump ore handled automatically increased the cost per ton as applied to the total production, though the actual cost for moving was much lower.

The increase of 6c. per ton for general expense was made up of a number of comparatively small items, which in the aggregate total a little more than $17,000. The cost of development work, 30,028 ft., at $7.32 per foot, was lower than for the preceding year, and this, coupled with the smaller amount done, served to reduce the total mining cost 9½c. per ton.

One dividend was paid within the year, at the rate of 30c. per share, aggregating $1,067,744. A further dividend at the rate of 15c. per share was declared within the year, and was paid in February, 1915.

At the commencement of the year the company had cash in bank amounting to $1,074,372. At the close of the year, after paying operating expenses and one dividend, the company's cash balance amounted to $655,703, with bullion and miscellaneous products settlements outstanding of $203,123. In June, 1914, the company acquired 592,000 shares, equal to 87% of the issued shares of the Aurora Consolidated Mines Co., at a cost of $763,011.

Total construction costs for the year were $94,659, of which $91,672 was expended for equipment for the re-handling of mill tailing. The gross production of the mine to date is 2,111,054 tons of ore, of an average value of $30.15, and a total gross value of $63,658,089. Of this production, $11,200,000 was made by lessees in the early days, and $2,700,000 was made by the constituent companies, prior to their acquisition by this company. The gross production by the company itself has been approximately $50,000,000. To date the company has paid dividends amounting to $27,398,215, or $7.70 per share.

Ore reserves are estimated as follows: milling, 141,500 tons; and shipping, 500 tons. This apparently shows a slight increase, $6000 tons, in the measurable ore reserves; but the increase is probably more apparent than real. While the method of estimating used was substantially the same as for the preceding year, the stoping experience for the past year has shown that in nearly every instance a larger tonnage has been mined from each block than it had been estimated to contain, and that, therefore, the ore reserves a year ago were underestimated. Therefore, less allowance has been made in the present estimate for the discovery of barren spots and the estimate is believed to be more accurate than the preceding one. The well-known irregularity which characterizes the distribution of the gold in the orebodies renders it impossible to estimate the value per ton of the developed ore. During the last two months of the year, however, discoveries of high-grade ore were made which render it certain that the ore reserves now in sight have a better average value per ton than those at the beginning of the year.

The mines of the company produced the following ore:

	Tons.	Average.
Mohawk	180,511	$12.37
Combination	43,496	14.81
Jumbo-Clermont	31,179	14.59
Laguna	38,201	13.37
Jumbo No. 2	2,164	18.35
Dumps	31,471	7.18
Contractors	5,728	12.95
Total	332,750	$12.57

The Jumbo-Clermont produced 5442 tons of shipping ore, containing $120,616 in gold and silver, and $37,282 in copper, an average of $29.01 per ton.

BOOK REVIEWS

MINING WORLD INDEX OF CURRENT LITERATURE. Vol. VI, for second half of 1914. By George E. Sisley. P. 234, with author's index of 10 pages, and subject index of 5 pages. Mining World Co., Chicago, 1914. For sale by the *Mining and Scientific Press*. Price, $2.

This useful compilation appears so regularly that it needs no introduction or comment. Under the headings of geology and mineralogy, metals and metal ores, non-metals, mines and mining, mills and milling, chemistry and assaying, metallurgy, power and machinery, and miscellaneous, the articles appearing in about 350 technical journals throughout the world have been carefully indexed, making the publication of value to editors, libraries, and those who desire to keep records of such information.

CENTRIFUGAL PUMPS. By R. L. Daugherty. P. 187. Ill., Index. McGraw-Hill Book Co., Inc., New York. For sale by the *Mining and Scientific Press*. Price, $2.

The introduction of the steam-turbine and the electric motor has reduced the cost of operation of centrifugal pumps and widened the field of their use. One result of this has been that the practical development of the centrifugal pump has outstripped the literature on the subject. The present volume will tend to remedy this condition. After describing the general features of centrifugal pumps, both of the turbine and volute type, the general theory of the entire subject is developed. Characteristic curves are then discussed, also the general question of pump efficiency. Two short chapters are devoted to a comparison of centrifugal and displacement pumps, and to a contrast between the various types of the former. The contents of the remainder of the book is best described by the chapter headings: Pump Testing, Costs, Rotary and Screw Pumps, Applications of Centrifugal Pumps, Design of a Centrifugal Pump. Problems are given at the end of most of the chapters and an appendix contains review questions. The book is well illustrated and there are a number of charts.

HEATING AND VENTILATING BUILDINGS. By Rolla C. Carpenter. P. 583. Ill., index. John Wiley & Sons, Inc., New York. For sale by the *Mining and Scientific Press*. Price, $3.50.

This is the sixth edition of a useful treatise. Few departments of engineering have more to do with the health and comfort of the general public than the heating and ventilation of buildings. The first five chapters deal with the theoretical basis for the consideration of the subject. Pipe and fittings used in heating systems are next discussed, and then radiators and heating surfaces. Following this, boilers and hot-water heaters are considered, space being devoted to the different types of boilers in use, together with their accessories and the methods of setting them. Next in order come steam-heating systems of both the gravity and the pump-return type. Then hot-water and hot-air systems are discussed. The subject of mechanical ventilators leads to that of hot-blast heating. A short chapter is devoted to electric heating, and one to thermostats and other temperature-regulating devices. A chapter is given to the heating and ventilating of special kinds of buildings, schools, factories, etc. Specifications and the general commercial aspects of the subject are then considered. The final chapter deals with the 'conditioning' of air, both for the removal of dust and for securing the correct proportion of humidity. The appendix contains a list of references and a number of tables, including the general mathematical tables to be found in most text-books as well as others especially valuable in heating and ventilating work.

RECENT PUBLICATIONS

GROUND WATER IN SOUTHEASTERN NEVADA. By Everett Carpenter. *Water-Supply Paper* 365. P. 86. Ill., maps, index. U. S. Geological Survey, Washington, D. C., 1915.

PULP CONSTANTS. By G. H. Clevenger, H. W. Young, and T. N. Turner. P. 16. Ill. Reprint from the *Mining Journal*. A thorough investigation into specific gravities of solutions and pulps.

PROCEDURE FOR ESTABLISHING A LIST OF PERMISSIBLE PORTABLE ELECTRIC MINE LAMPS. P. 13. U. S. Bureau of Mines, Washington, 1915. Contains details of fees, character of tests, and conditions under which lamps will be tested.

PLAN of Kirkland Lake and Sesekinika gold areas, showing the properties of Ogilvie and McKinnon. Townships of Teck, Lebel, Otto, and Boston, district of Temiskaming, Ontario, Canada. 27 by 33 in. Scale, 40 chains to 1 inch.

SPECULATION ON THE STOCK EXCHANGES AND PUBLIC REGULATION OF THE EXCHANGES. An address before the American Economic Association at Princeton, New Jersey, December 29, 1914, by Samuel Untermeyer of New York. P. 48.

ORE DEPOSITS OF NORTHEASTERN OREGON. By Arthur M. Swartley. Vol. I, No. 8, *The Mineral Resources of Oregon*. P. 229. 98 illustrations. Corvallis, Oregon. December, 1914. An abstract of this paper was published in the *Press* of February 27.

THE TOM REED-GOLD ROAD MINING DISTRICT, MOHAVE COUNTY, ARIZONA. Map and details of certain operating companies. Published by the Tom Reed-Gold Road Association, Los Angeles, California. A review of this publication appeared in the *Press* of April 3.

ZINC AND LEAD HANDBOOK. By L. L. Wittich. P. 60. Map. Published by the *Joplin News Herald*, Missouri, 1915. This is a useful compilation which should be in the hands of all zinc and lead miners and dealers. The booklet was reviewed in the *Press* of April 3.

University of California publications, Berkeley, 1915:

THE COMPREHENSIVE STRENGTHS OF PORTLAND CEMENT MORTARS OF VARIOUS PROPORTIONS. By Arthur C. Alvarez. P. 4. Chart.

SOME PHYSICAL PROPERTIES OF MAGNESIAN CEMENT MORTARS AND CONCRETES. By Arthur C. Alvarez. P. 44. 5 plates.

THE CONSULTING METALLURGIST AND METALLURGICAL INVESTIGATIONS. By W. B. Blyth. P. 38. Illustrated. Abstract from *Bulletin* of the Australasian Institute of Mining Engineers. Melbourne, Victoria. This paper is of considerable value to metallurgists, as showing the errors they are liable to get into. In the *Press* of April 3 an abstract was made from this paper on the subject of flotation of gold ores.

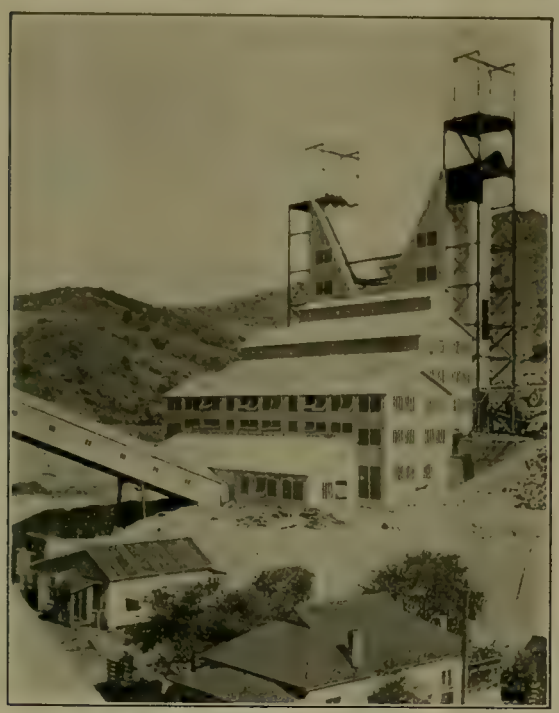
ESTADISTICA MINERA DE CHILE EN 1910. Compiled by Don Guillermo Yunge. P. 466 and numerous maps. Santiago de Chile, 1913. A detailed account of the republic of Chile and its mineral production. It also contains several papers on copper, including one on the Chuquicamata deposits, which will be translated for the *Press*.——ALSO ANUARIO ESTADISTICA DE LA REPUBLICA DE CHILE. 1913. Vol. VII. Mines and Metallurgy. The mineral output in 1913 was valued at ₱364,126,550, of which nitrates accounted for ₱325,970,081.

New Machines and Devices

Information based on letters and catalogues from manufacturers, and staff observations.

Hoisting 10,000 Tons in 14 Hours

At the Inspiration Consolidated copper mine, Miami, Arizona, a concentrating plant to treat 10,000 tons per 24 hours is nearing completion. To hoist this quantity of ore some



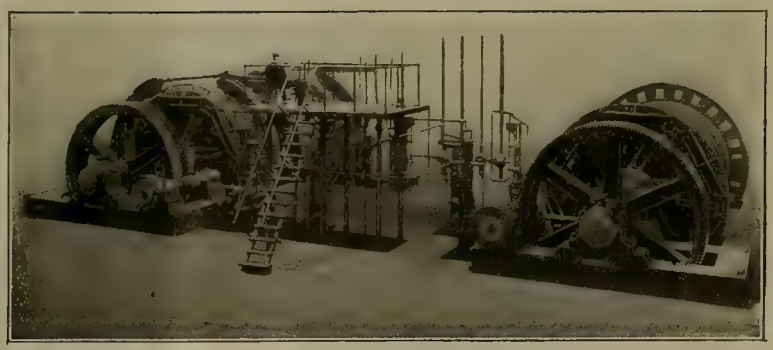
TWIN SHAFTS AND HOIST-HOUSE AT THE INSPIRATION COPPER MINE, MIAMI, ARIZONA.

massive machinery is necessary. The engineers of the Nordberg Manufacturing Co., Milwaukee, Wisconsin, and the General Electric Co. of Schenectady, New York, have succeeded in designing an electric machine capable of hoisting 10,000 tons in 14 hours, with capacity for overload up to 14,000 tons in that time. The machinery has been installed at the mine, and the following notes should give an idea of the system employed.

As will be seen from the first half-tone, there are two shafts at the mine close together, an arrangement well known on the Rand, and, becoming more generally used. This and other conditions being favorable, it was decided to arrange two hoists in one building and operate them automatically. The hoists can be started up for an all-day run by closing a pilot-switch. Each hoist will then start, run, stop, and rest automatically. The two hoists make alternate trips, one hoist running while the other is loading and dumping. By opening auxiliary pilot-switches the rope-speed may be decreased, in order to reduce the number of trips per hour at times when the output of ore is low. Ordinarily, one hoist begins to accelerate just before the other hoist finishes a trip. However, in case the output increases above normal, another pilot-switch can be closed; this will cause each hoist to begin its trip considerably before the other hoist has finished a trip, obtaining thereby a greater number of trips per hour than normal. Skips which weigh 12,000 lb., and carry 24,000 lb., are to be loaded automatically in the mine.

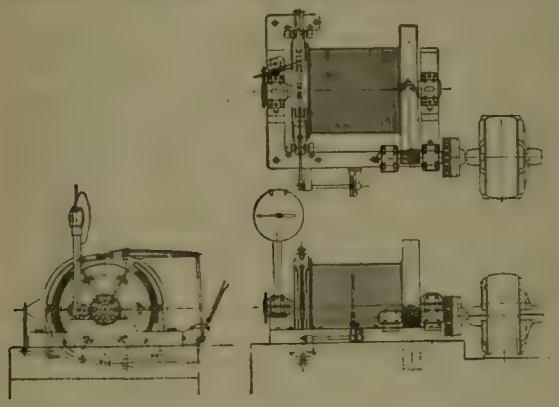
In order that the automatic control mechanism may not be a cause of delay or confusion in case it becomes necessary, on account of conditions inside the mine, to depart entirely from the automatic schedule of operation, all details have been worked out so as to provide that certain features of the control can be instantly disconnected at any time. Either hoist can then be controlled by an operator in the ordinary manner. The throw-over from automatic to hand operation and the reverse, is accomplished entirely by throwing levers, and does not require any readjustment of mechanism. The means whereby, in automatic operation, the hoist is retarded to rest and the brakes applied at the end of the trip, is also effective when operating by hand-control providing, thereby, complete over-wind protection.

Although the problem of designing the control seemed formidable at first, due to the necessity of providing so many different rates of automatic operation, and providing for a simple and safe transition from automatic to hand operation, and the reverse, a thorough study of the conditions resulted in a relatively simple and compact equipment. The advantage gained by the use of the automatic control mechanism is that, considering all conditions, four operators per day, two per shift, can be dispensed with. As the hoist-house, sub-station, and compressor-house are under the same roof, the starting and stopping of the automatic operation of the hoists, inspection, occasional operation by hand control, and in fact all attendance on the hoists can be taken care of by the operating force required for the sub-station and compressors. The hoists have two drums 10-ft. diameter by 65-in. face for 1000 ft. of 1¾-in. rope. The load consists of rope, 4850 lb.; skip, 12,000 lb.; and ore, 24,000 lb., making the rope pull 40,850 lb. They will work in balance with a normal rope speed of 750 ft. per minute. Each hoist is driven by one 580-hp. direct-current shunt-wound hoist motor, coupled to the pinion shaft of the hoist, and driving the drums through a single reduction of



SIDE VIEW OF THE TWIN HOISTS.

Falk gears. Each hoist-motor is operated from a separate generator by means of generator-voltage control, as is the usual practice for large direct-current hoists. The two generators are driven from a single induction-motor and flywheel,



END AND FRONT VIEW AND PLAN OF HOISTS.

comprising a three-unit set with exciter overhung at one end, and flywheel arranged outboard at the other end. Power is obtained from the Roosevelt dam of the U. S. Reclamation Service.

Concentrators at the Exposition

In the Palace of Mines and Metallurgy at the Exposition the Senn Concentrator Co. has a working exhibit in its amalgamator, concentrator, belt concentrator, batea, and table machine. All of these have the characteristic pan motion. At a later date a pulp will be used on the machines to show their actual action.

Pulleys at the Exposition

One of the features at the American Pulley Co.'s exhibit in the Palace of Machinery at the Exposition is the demonstration which shows the perfect balance of all 'American' pulleys. A 72-in. diameter by 36-in. face, triple-arm, steel-split American pulley, weighing approximately 1500 lb., is turned with perfect ease with a thread of the thinnest silk. The American pulley is so built that the spider arms give the greatest strength with minimum air resistance. A new device called an 'efficiency indicator' (patent pending), measuring accurately to 3/1000 of a horse-power, shows the exact amount of power required to revolve any pulley.

Commercial Paragraphs

The WITTE IRON WORKS CO., of Kansas City, Missouri, has changed its name to WITTE ENGINE WORKS, but remains under the same ownership and management, Ed. H. Witte controlling the firm.

A large number of safety lamps with automatic lighting device, made by the KOEHLER MANUFACTURING CO., Marlboro, Massachusetts, is being exhibited in the 'mine' at the Panama-Pacific Exposition.

Adjustable quick-discharge 5 by 16-ft. tube-mills have recently been sold by CHALMERS & WILLIAMS, INC., of Chicago Heights, Illinois, to the Cusi Mining Co., Chihuahua, Mexico, and the Standard Silver-Lead Mining Co., British Columbia.

The GOLDMAN PROCESS CO., of St. Louis, Missouri, sends a pamphlet on water-treating process. Impurities in water are a source of trouble in steam-boilers, resulting in scale, pitting, and loss of efficiency. The Goldman company claims to have a simple and cheap method to minimize such troubles, which are common on mines and railroads.

The 500-hp. Diesel engine of the BUSCH-SULZER BROS.-DIESEL ENGINE CO., in the centre of the Palace of Machinery, at the Exposition, will be opened up for inspection of visiting engineers from 9 a.m. to 5:30 p.m. every Monday, so that they may see the enclosed working parts which cannot be seen while the engine is in operation.

The LAGONDA MANUFACTURING CO., of Springfield, Ohio, has just published a booklet entitled, 'Lagonda Boiler Room Specialties.' It describes and illustrates the firm's several types of boiler-tube cleaners, with latest improvements, and boiler quick repair tools. It also deals with the automatic cut-off valve and multiple strainers made. A copy may be hand on request.

JOHN H. BANKS, formerly of the firm of Ricketts & Banks, announces that he is at 61 Broadway, New York. Facilities for ore testing on a practical scale continue as heretofore, the equipment for analytical and assay work having been installed with reference to ores, fuels, and metallurgical products, and the laboratory staff selected for ability and experience in this class of work.

The WESTERN ELECTRIC CO.'S business in 1914 resulted as follows: sales, $66,408,484 ($77,532,860); net earnings after paying fixed charges, reserve for contingencies, etc., $2,670,960 ($3,171,695); dividends, $1,500,000 ($1,500,000); and surplus, $1,170,960 ($1,671,695). Figures in parentheses are for 1913. Orders on hand at January 1, 1915, were $4,309,000 in value less than on January 1, 1904. The number of employees at January 1, 1915, was 15,650, compared with 19,856 at January 1, 1914.

The introduction of the OLIVER FILTER into the Coeur d'Alene district of Idaho for dewatering flotation concentrate is creating considerable interest among the millmen of that state. The Oliver filter installed at the Gold Hunter mill, near Mullan, is reducing the lead flotation concentrate to an average of 6½% moisture, and has so far exceeded expectation that Oliver filters have recently been ordered by the Bunker Hill & Sullivan Co. at Kellogg, Hercules Mining Co. at Burke, and the Consolidated Interstate Mining Co. at Wallace. In addition to these four filters for the Coeur d'Alene district the Inspiration Consolidated Copper Co. of Miami, Arizona, is installing four Oliver filters with a total capacity of 1000 tons per day, and the Anaconda Copper company is adding five additional Oliver filter units to the three units which have been in operation there for the past year. The Oliver filters at the Anaconda plant are 11 ft. 6 in. diameter by 12-ft. face, and have an average capacity of 330 tons each per day.

The GENERAL ELECTRIC CO., of Schenectady, New York, announces that practically all the sizes and types of Edison mazda multiple lamps are affected by reductions in list prices that were put into effect April 1, 1915, by its Edison Lamp Works. On the regular straight side and round bulb lamps, from the 10 to the 250-watt sizes, also on sign lamps, stereopticon lamps, etc., the reductions range from 3 to 20c. per lamp, according to size. These reductions, which average about 10% will tend to popularize further already popular lamps. The new concentrated filament vacuum lamps of 25, 40, and 60-watt sizes now list at only 5c. per lamp more than the regular lamps of corresponding sizes. On the gas-filled multiple lamp of 100 to 1000-watt sizes, the reductions range from 50c. to $1 per lamp, the average reductions being between 20 and 25%. The introduction of gas-filled lamps has been exceptionally rapid. Over 1,000,000 are already in use. The decreased cost of these lamps will undoubtedly result in a still more rapid replacement of vacuum lamps by the more efficient gas-filled units.

Mining and Scientific Press

Edited by T. A. RICKARD

Volume 110 SAN FRANCISCO, APRIL 24, 1915 Number 17

HYDRAULIC MINING is one of the most impressive applications of water-power. By means of it large deposits of low-grade gravel are exploited profitably. See the article on Atlin in this issue.

THE

Leadville Drill-Column Hoist

OPERATES WITH STEAM OR AIR

For General Utility Work Anywhere

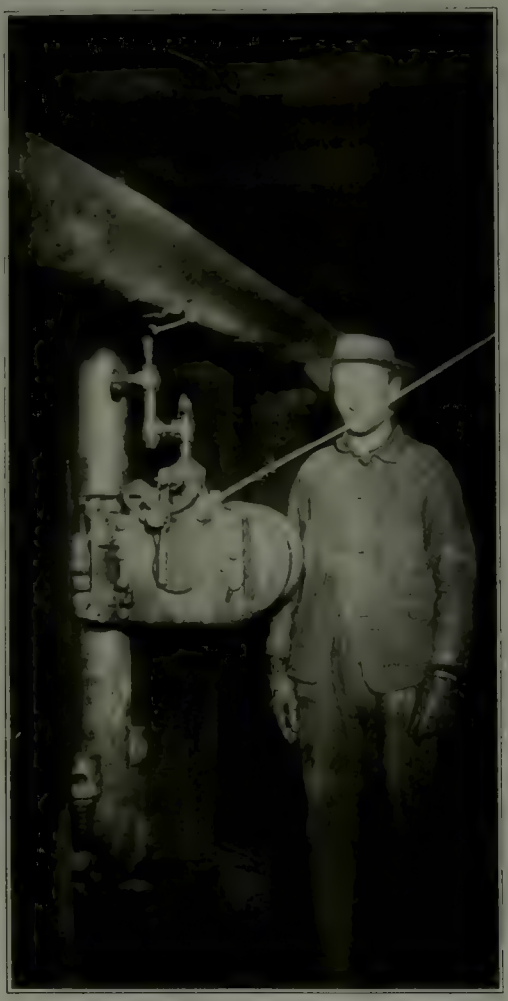
Particularly Useful in the Mine

Clamp is Adjustable to Fit any Drill Column or can be Bolted to Timber

Bearings Bronze Bushed

Drum is Supported on Bronze Bushing

No Strain on Drum Shaft. It is Built like a Full Floating Auto Axle



Weigh 200 Pounds

Pulls 750 Pounds

Holds 500 Feet of Rope

Engine is Reversible

Cannot get on Center

All Joints Ground

No Stuffing Boxes

Gears are All Enclosed

Powerful Brake Lined with Raybestos

This is a real hoist—built right. It has been tried out in every conceivable kind of service. It is a money saver and you cannot afford to be without one.

Pro and con, with notes by the Editor.

A SUGGESTION.
By F. Sommer Schmidt 643

An engineer suggests that discourtesy adds no force to criticism.

ARTICLES

THE HUMAN SIDE OF MINING.
By James F. Kemp 644

Mining engineers, more than other men, need to be versatile. Technology too often ignores the call of humanitarianism. Professor Kemp thinks that universities might well have a professor of life.

HYDRAULIC MINING AT ATLIN.
By A. D. Hughes 647

The average depth of the deposits worked is 60 ft. Water is available under a head of 140 ft.; eight monitors are in use, three of them employed for stacking the tailing. The most economical size of pit is 30,000 cu. yd. The working season averages 180 days; in this time 175,000 cu. yd. is excavated. The working cost ranges from 12c. per yard in No. 1 pit to 20c. in No. 2, where clay gives trouble and decreases the daily yardage.

Page.

THE ANACONDA EXHIBIT.
By E. S. Bardwell 654

All the activities of the Anaconda Copper Mining Co. are well exemplified by its exhibit in the Mines Palace of the Panama-Pacific International Exposition.

LEACHING OF COPPER ORES BY THE HOFFMAN PROCESS.
By Frederick J. Pope 655

The problem of the leaching of the oxidized copper ores at Ajo, Arizona, has been studied by F. J. Pope and A. W. Hahn, who have devised a process in which the iron is removed from the solution before electrodeposition of the copper is attempted.

A TEMPORARY ZINC-BOX.
By A. W. Allen 657

An engineer describes the method he pursued at a South American gold mine when the permanent equipment failed to arrive in time.

SOCIOLOGICAL WORK BY THE PHELPS-DODGE COMPANIES 658

Records of the results attained during 1914 in conserving the health and welfare of the employees of this great organization.

ELECTRIC SHOVELS

WHY
Pay for Hauling Coal
When Electric Power Transports Itself?

Electric Shovel Equipped with G-E Motors.

Increase profits by equipping your shovel with G-E Motors. Labor charges can be reduced 30%, repair bills cut in half and boiler and feed water trouble avoided.

No firemen and fire banking are necessary, nor is it necessary to leave a watchman on the job.

Electric shovels operate like a steam shovel and equal or surpass it in every respect.

The General Electric Company makes a complete line of motors for this service. Its recommendations are based on years of actual experience with existing electric shovels and on a thorough knowledge of shovel operation.

EDITORIAL

T. A. RICKARD - - - - Editor
THOMAS T. READ - Associate Editor

OVER-SUBSCRIPTION of the Alaska Juneau issue indicates that money is readily available for sound mining enterprise.

FROM the Southwest we hear of young men outfitting parties for mineral exploration. This is a fresh sign of renewed mining activity, and it is one of the best.

PROSPERITY among the farmers is a better omen of expansion in business than a favorable trade-balance. When both point the same way, the future is assured.

ONLY 1% of the Mexican people is engaged in warfare. It is incorrect to assume that the continued disturbance is due to an unslaked popular desire for constitutional reform.

HUERTA gave the press a description of the kind of patriotic hero that Mexico needs at this juncture. We infer that he was facing a mirror at the time he spoke to the reporters.

MEXICO has had 8 presidents since Diaz. The average is higher than that of the 50 years preceding Don Porfirio; during that half-century the change of régime averaged once per annum.

THE invitation to a conference on Pan-American finance has been well received, and a representative gathering at Washington next month is assured. Extension of banking facilities must precede any increase of commercial intercourse between the Americas.

LEADVILLE is profiting from the high price of zinc, due largely to a curtailment of Australian production. Among new developments, we note the employment of electric pumps for the unwatering of the Down Town district, as the first step to a resumption of exploratory work below the old workings, which reach to 760 feet.

ILLUSTRATIONS showing the outside of mill and smelter buildings are common in technical papers. Indeed, such photographs of exteriors are often the only ones available at the time of publication. Usually, however, they have no value whatever, even from a decorative point of view. It is the machinery inside, not the box, that is of importance.

STEAMERS of large tonnage and first-class equipment are soon to ply between New York and San Francisco, through the Canal. In May the *Kroonland* and *Finland,* formerly of the Holland-America line, are to be employed in this service. As they are each of 22,000 tons displacement, they will ensure space and comfort. When conditions in Europe return to the normal, we may expect the establishment of a similar passenger traffic between San Francisco and Liverpool, London, Cherbourg, or Hamburg.

OUR New York correspondent refers to the Minerals Separation *v.* Miami suit now being tried at Wilmington. Behind the Miami Copper Company stand a number of the other big copper-producing companies. Hence the decision is awaited with keen interest.

COLORADO gives signs of a certain liveliness in mining, but accurate news is scanty. Time was when this state was well advertised by resident engineers, who wrote articles in the technical press concerning its mineral resources and industrial progress. We shall be glad to hear from our friends at Denver, Central City, Leadville, and Cripple Creek.

DISSOLUTION of the Amalgamated Copper Company is pending. The details of the plan to effect the change are likely to be announced shortly. Another case of unscrambling the eggs that have lost their savor. This dissolution may seem intended primarily to allay public distrust, but it is more likely to be merely a step taken to promote convenience in business.

SHANTUNG is already beginning to be of value to its Japanese captors. According to the *Japan Times* the iron ore deposits near Ching-ling-chen, in that province, have been investigated and 30,000,000 tons of ore containing 65% iron is estimated. The mines are only five miles from the railway. A Japanese company will proceed at once to exploit them to supply the Japanese Government iron-works, at Wakamatsu, which now derive their supply of ore from Hupei and Korea.

FROM a newspaper published in one of the belligerent countries of Europe we note that the service of geologists is recommended in warfare. It is argued that scientific advice regarding the nature of the soil and rock is necessary to the proper emplacement of guns and trenches. Perhaps it is, but we sympathize with the geologist, who lives in a world far detached from human strife, in a world of silent forces working during periods so vast that the worries and anxieties of this fleeting present seem inconsequent. That ought to be one of the advantages of being a geologist.

KAOLIN is a mineral of much economic importance, since it forms the basis of the ceramic industry, the handmaiden both of domestic utility and of fine arts. The name is based upon a misconception. Early

travelers in China asked the natives from what material they made their porcelain, and were told that it came from *kao-ling*—a high ridge. *Kao* should be pronounced 'gow'; both the spelling and pronunciation have therefore undergone metamorphic action in the process of absorption into the English language. As to the origin of the material itself, there have lately arisen two schools of opinion. The older concept is that it is a product of the weathering of feldspars. About ten years ago Rösler advanced the theory that it is rather the product of pneumatolytic processes. This met with strong opposition, and Stremme was able to prove that the large deposits at Meissen are the product of weathering. Experiments made by Lemberg, and later confirmed by Thugutt, show that when solutions of potassium and sodium salts are allowed to act on kaolin at temperatures between 100° and 200°C., the kaolin is converted into silicates resembling sodalite, nephelite, and analcite. The logical conclusion is that kaolin could not be formed in mineral deposits originating at temperatures above 100°, such hydrous silicates as sericite being the normal product. In this country Mr. Waldemar Lindgren is a vigorous supporter of the weathering theory, and in a recent number of *Economic Geology* he has set forth the reasons for the faith that is in him. The burden of proof seems to be on the shoulders of the advocates of the pneumatolytic theory.

Copper

In one of his delightful books Stewart Edward makes the epigrammatic observation that the surest way to success in any enterprise is through the elimination of the obvious. It is reported in New York that the producers of copper are endeavoring to prevent the price of that metal from going above 18 cents per pound in the next few months. At first sight this seems irrational, but by eliminating the obvious it becomes evident that this is a wise course of action to pursue. The present demand for brass and copper in the manufacture of ammunition is a purely temporary phenomenon, and at the end of the War, which may come at any time, copper consumption will probably be sub-normal, at least until the work of repairing war's destruction gets into full swing. On the other hand, a considerable addition to copper production is about to be made. The Chile Copper Company, operating the famous mines at Chuquicamata, expects to have its plant operating within a few months, turning out copper at the rate of 500,000 pounds per day, at a cost that, it is estimated, will permit its delivery in Europe for 6 cents per pound. The Inspiration Copper Company has its plant nearly ready to begin production; before long the Anaconda will increase its output greatly by the aid of its new flotation and leaching plants; the Utah Copper is about to increase its production by leaching the oxidized ore removed in mining the sulphide orebody; the Calumet & Hecla plans to treat its old tailing by concentration and leaching; and numerous smaller companies are prepared to increase their output. If the delivery of this new copper on the metal market should coincide with a period of abnormally high prices a violent collapse of the market might ensue. The best interest of everybody concerned seems to be served by maintaining a price for copper not much above normal, lest it be followed by a price much below normal. Stability is essential to industrial success.

Alaska's Great Goldfield

The big-scale exploitation of the schist range on the mainland behind Juneau has reached an interesting stage. The Alaska Gold Mines, the company now controlling the old Perseverance mine and its extension toward Sheep creek, has begun production, crushing 1800 tons per day. The plant already erected can crush 10,000 tons per day, so that its ultimate capacity is estimated at 3,500,000 tons per annum. As to yield, the original report by Messrs. D. C. Jackling and A. F. Holden gave $1.50 as the recovery and 75 cents as the cost, indicating a profit of 75 cents per ton. Later forecasts of $1 profit per ton have appeared in the circulars of Hayden, Stone & Co., the promoters of this interesting enterprise, but we are not aware of any confirmation of the higher figure by the engineers. Of the two sponsors, Albert F. Holden died two years ago, so that Mr. Jackling is now the principal factor in the technical administration. Not many mining engineers have had a career so productive of big and useful work. His success in low-grade big-scale copper mining has given him just the mental grasp that was needed for this work in Alaska, where he has applied many of the mechanical methods of ore reduction evolved in the exploitation of the disseminated chalcocite deposits of Utah and Arizona. But gold deposits differ from the chalcocite enrichments in one important particular: they are more sporadic as regards the distribution of metal; they are more difficult to sample; and therefore involve a larger factor of uncertainty. Despite the systematic development and testing in progress during the last two or three years, the work done by Mr. J. R. Mitchell, formerly superintendent of the Perseverance mine, constitutes the most reliable evidence in regard to the grade of the ore. He stoped the lode for a width of 70 feet and a length of 900 feet during a period of 6 years, supplying a 100-stamp mill with material that yielded $1.50 per ton, at an operating or local cost of 90 cents per ton. An enormous extent of development work has been done since then, not only in the Perseverance mine, but in its neighbors westward, the Alaska Juneau and the Ebner. Nevertheless even today the average grade of the output to be obtained when operating on a bigger scale remains the one uncertain factor. As to cost, there is no doubt. The experience at Treadwell, on the adjoining island of Douglas, together with several years of actual operation on the Juneau side, suffices to assure a total cost of 80 cents per ton, on a basis of 6000 tons daily. In regard to metallurgical extraction also there

is no uncertainty, for the gold-bearing quartz is eminently docile, yielding over 90 per cent of its precious content readily. The grade, of course, depends upon the character of the lode and the system of mining required to extract its valuable portions.

In the Perseverance ground the lode-channel is more nearly uniform as regards the distribution of quartz, which, it may be noted, is roughly proportional to the gold in the ore. The more quartz the lode contains, the more gold it will yield. Clean quartz usually assays about $6 per ton in gold. In the Juneau the lode-channel widens to 900 feet; it consists of a belt or sheer-zone of slate between a foot-wall of greenstone and a hanging wall of schist. The lode-channel is traversed by dikes of meta-gabbro and by stringers of quartz, irregularly distributed, with a tendency to form wide bands of ore, separated by waste, so that selective mining is imperative. A 50-stamp mill has been in operation for a year, crushing about 1000 tons daily, and proving that the ore, after some underground sorting, can be made to yield an average of nearly $2 per ton. The cautious character of this statement reflects the fact that the evidence does not, as yet, warrant definite assertions. The Ebner is an old enterprise that was re-organized in 1913 preparatory to an arrangement whereby the United States Smelting, Refining & Mining Exploration Company undertook to explore the property systematically, finding the money for the work on condition that it became a first lien on the assets. Moreover, the exploration company agreed to find the additional capital required for further development and equipment if the exploratory work showed $15,000,000 in ore. Since then this company, under the direction of Mr. Sidney J. Jennings, has tested the ground and has come to the conclusion that while large reserves of ore have been proved, they do not justify the formation of a new company on the terms set forth in the re-organization plan of 1913. More than 8000 feet of underground work has been done, the sampling of which has given assays "varying from a trace up to $13.71," as stated in a circular recently issued. Inexperienced persons may assume that the average lies half-way between 0 and 13.71, but, of course, it does not. In such statements the truth inclines at a high angle from the upper limit; it merely means that the yield varies so widely as to render it dangerous to assert an average. It is stated, however, that while no such reserve as $15,000,000 has been uncovered, the ore assured is "many times in excess of the indebtedness" to the exploration company. This indebtedness amounts to $408,921, of which $162,590 represents liens and other obligations incurred during the earlier period of disorganization. We understand that the committee of bondholders, headed by Mr. E. R. Chapman, of New York, is prepared to liquidate existing debts and proceed with the development of the enterprise on a big scale. Meanwhile the exploration company has forced a foreclosure sale, to the terms of which the bondholders are offering opposition. Concurrently the Alaska Juneau company has issued 400,000 shares, out of 500,000 now in the treasury, at $10 per share, making a total issued capital of $14,000,000. It is estimated, by Messrs. F. W. Bradley and John H. Mackenzie, that, by the aid of the plant to be built with the proceeds of this additional capital, the profit from the mine will be $1,400,000 per annum. We understand that the profit is estimated at the rate of 70 cents to $1 per ton, indicating a tonnage of 1,500,000 to 2,000,000 annually. Thus the three mines, covering 4 miles of lode, from Gold creek to Sheep creek, west to east, will be crushing 5,000,000 tons at an early date. This tonnage should be doubled ere long. As the three companies constituting the Treadwell group, on Douglas island, are crushing 1,600,000 tons per annum, to be increased to 2,000,000 tons, the total output of this gold-field tributary to Juneau will be about 12,000,000 in tons of ore and $25,000,000 in gold produced. This means the creation of a local industry that will bring southeastern Alaska into the front rank of the mining world. It will have another effect, to which we attach considerable importance: the increase of population and the enhancement of interest in this part of the Coast will incite intelligent exploration throughout the Alaskan schist range, rendering probable the discovery of other deposits suitable for profitable operations.

On the Threshold

In this issue we publish the larger part of an address delivered by Mr. James F. Kemp, professor of geology in the Columbia School of Mines, to the graduating class in the Michigan College of Mines. Our friend's admonitions must have been received with keen interest by the young fellows in the Copper Country, and they will be read also with pleasure by many of the older fellows in other parts of the world. We need such reminders of the human side of the mining industry and of the profession that ministers to that industry. An engineer must be a real man if he is to make good, not merely a specialized machine for collecting the shekels. A professor must be a friend, as well as an instructor, to his students. Both engineer and professor must have post-graduated in the philosophy of Life, besides acquiring those sundry suffixes that mark unusual proficiency in the arts and sciences. We like to picture the scene of that address at Houghton. The speaker made mention of more than one 'Life and Letters.' We commend young men—and those that desire to remain young in spirit—to read such biographies and autobiographies. Therein, more than in any other form of literature, is given the experience of the individual and the philosophy of living. Experience unfortunately is not cumulative; but it should be suggestive, at least. Even as an education in science, it is well to read the records of the old worthies in order to understand the successive steps by which fundamental concepts and accepted theories were evolved. But the larger lesson, undoubtedly, is that emphasized by Mr. Kemp. We agree with him in rejecting the half-truth that men are machines. That

notion is one of the weak points in most schemes of technical training. It is also a mistake made by many industrial organizations. In peace, as in war, discipline is necessary, but not at the entire expense of initiative. In professional work the personal equation continues to be the incalculable, yet dominating, factor. To know things is important; to know men is more important.

Mr. Kemp referred to the welfare movement, whereby a systematic effort is being made to improve the conditions under which employees live as well as work. The fact is becoming more fully recognized that while the workman physically is a machine, he is not merely a muscular device capable of a given number of foot-pounds of energy. To the mechanical must be added a psychical factor. As Pascal said long ago, "Man may be only a reed, but he is a thinking reed," not an automaton. Therefore any young man expecting to be in charge of laborers, whether in mines or smelters, will do well to study human nature on the job, as it were, so that he and they together may become an efficient economic unit.

Incidentally, we can say to graduates on the threshold of a career, that personal acquaintance with those engaged in their profession is tremendously useful. It is well for a young man to cultivate a large acquaintance, out of which in due time will come to him the opportunity to play his part. Whatever is done in this world is done in the last resort not by machines but by men. It is well to be interested in other people, to be willing to be helpful generally. Co-operation is a characteristic of civilization. The man that plays a lone hand has a poor time in the game of life. This is one of the first lessons to be learnt by the young man fresh from college. We lay stress upon it, so that the habit may be acquired while it can be applied to the greatest effect. For the rest, it remains only to second the admonitions of all true friends of youth and say for the *n*th time that "man does not live by bread alone." The collection of shekels gives luxury and power, it affords exhilaration in the pursuit, but usually proves a Dead Sea apple in the capture, unless it be accompanied by the development of the man's other and higher faculties. In the end, a happy marriage, a few friends, good health, a competence, and some purpose honorably achieved are the desiderata amid this flux of phenomena we call Life.

Courtesy in Discussion

A correspondent writes making a protest against, what seems to him, the frequent lack of courtesy shown by engineers when engaging in printed controversy. We hope he exaggerates, for, if his criticism is to be taken at its face value, it reflects upon the editors as well. The latter are under obligation to defend any contributor from anything verging upon impertinence or insult. The pages of a respectable technical journal invite the exchange of ideas only on the assumption that any discussion is to be conducted in a spirit of decorum and kindly feeling. Whenever a contributor transgresses the canons of good taste and gentlemanly conduct, it behooves the editor to refuse him admittance, as it were, so that those of gentler mental bearing may not suffer from his gaucheries. However, anything of this kind is extremely rare, so that disciplinary interposition is correspondingly infrequent. We publish the letter from Mr. Sommer Schmidt rather as a suggestive warning, as indicating that a detached onlooker has formed an unpleasant impression, which we deprecate.

This is not the first time that the amenities of printed controversy have formed the subject of discussion. It is not easy to be both penetrating *and* polite. The free thrust of trenchant wit and the outspoken disagreement of personal opinion occasionally entail clashes of a kind likely to trespass on the good temper of a disputant. Fortunately, in America more than anywhere else, independence of opinion and directness of statement are no social crimes. It may be that with the ampler play of personality there is a danger of over-stepping the line that divides frankness from rudeness. The only rule is to put yourself in the other fellow's place. Another is to recognize that the purpose of science is to elicit the truth, neither illuminating nor scorching the truth-seeker. Indeed, it is light without excessive heat that needs to be generated. And it can be done so as to promote the good of all.

As is stated in the sub-heading of our Discussion department, considered criticism is better than casual compliment. Indeed, the greatest compliment to a writer is not an unctuous Amen but a discriminating criticism likely to further the purpose with which the original article was written. Not infrequently a contribution of a modest or even of a fragmentary character will elicit such comment and supplementary information as eventually to render it more useful than the more pretentious essay or monograph. Furthermore, the reader of a technical paper like ours may occasionally see an error of fact or inference in an article. It is the editor's duty to guard against such blunders, but it is human to err and it is divine to forgive. And the best way to forgive is to rectify. This can be done effectively by writing promptly, correcting the mistake, and adding a little supplementary information, as a sugar coating to the pill. We are confident that the Discussion department of this paper, for example, serves a most useful purpose. By affording an opportunity for men at a distance from each other to exchange ideas, compare experience, and to make mental acquaintance, it promotes the solidarity of the profession. We are aware also that many engineers are willing to send a contribution to discussion when they are too busy to write complete articles or too diffident even to try to do so. We hope they will give way to the occasional impulse to correct an unwitting mistake, counter an opinion with which their knowledge disaccords, or to emphasize the fruitful idea of a fellow-practitioner. And it can all be done with the spirit and manner that makes friends, even of those that are controverted. Therefore, we invite the profession to use our columns as a clearing-house of ideas and experience.

DISCUSSION

Readers of the Mining and Scientific Press are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this Journal.

Life and Property in Mexico

The Editor:

Sir—Referring to your editorial on this subject in your issue of April 10, my own experience in that country, covering nearly six years, fully endorses your point of view.

The present factions do not represent any real policy in government, and they have no respect for life or property. Mining property that I owned in the southern part of Mexico has been inaccessible for three years and a half. Nevertheless at the start I continued to pay taxes. The taxes were then doubled. The fighting faction in this particular region also demanded taxes, and also doubled them. Private intimations were then given to me by the *de facto* Government that paying taxes to rebels was giving them support: fines and worse trouble might result. Similar instructions were received from the rebels, who said that paying taxes to a wicked usurping and unconstitutional government was a crime, etc. As in no case was any guarantee or protection afforded, and it was impossible to work the mines, I abandoned the property.

Several friends of mine have had similar experiences. Truly one is between the devil and the deep sea, when if you don't pay your taxes the property is lost, and if you do pay, you pay double to two different governments and then get into trouble for paying.

Assay of Ore Containing Metallics

The Editor:

Sir—In your issue of October 24, 1914, in the 'Concentrates' column, you had an article, with illustrations, on a method of figuring metallics contained in samples for assay, which I read with interest.

This seems to be a subject of great annoyance to a number of men and boys doing assaying work, and the method published by you was a great help to many, I have no doubt. Being interested in this subject, I am wondering whether or not the method used here in the assay-office of the Omaha plant of the American Smelting & Refining Co. would be of interest. It has been used for seventeen years, to my knowledge, and I think it will be found shorter than any other.

The main point of the method lies in the fact that 10 assay-tons of the sample must be taken, bucked down, and all its metallics must be reduced to find the total amount of silver and gold contained therein. In the following example of the method the metallics were not as rich as the pulp, and necessarily reduced the average assay. After bucking down 10 A. T. there is obtained 4.723 A. T. of metallics. The pulp carries 1187.28 oz. Au per ton. The metallics contain 862.23 mg. Au.

```
10.000          1187.28
 4.723             5.277 A. T. of pulp
------          -------
 5.277           831096
                 831096
                 237456
                593640
                -------
                6265.27656
                 862.23     mg. Au in metallics
                -------
                712.7506 average assay
```

The reciprocal of this would be:

```
1187.28          11872.8
   4.723          5607.5
-------          -------
 356184           6265.3
 237456            862.2
 831096          -------
 474912           712.75
-------
5607.52
```

An instance where the metallics increase the assay is as follows:

```
10.000
 0.012
------
 9.988
 96.8
------
 79904          Reciprocal
 59928          96.8          968.
 89892          .012          1.2
-------         ------        ------
966.8384        1936          966.8
 97.83          968            97.8
-------         ------        ------
106.466         1.1616        106.46
```

From 10 assay-tons there was secured 0.012 assay-ton of metallics, which contained 97.83 mg. Au. The pulp assays 96.8 oz. Au per ton. The foregoing illustrations will doubtless serve to make clear the method followed.

GEORGE C. MCINTYRE.

Omaha, March 26.

Amalgamation in Hardinge Mills

The Editor:

Sir—I wish to compliment Mr. Girard on his contribution to 'Discussion' on this subject. He seems to have expressed the scruples of most of us who are interested in this phase of amalgamation. Anticipation of the troubles described by Mr. Caetani has deterred me from trying the experiment, although I would have tried it anyway if there had been sufficient excuse in bad extrac-

tion or saving in cost in our 40-ton mill using Hardinge ball and pebble-mills and counter-current decantation with Dorr machines.

It has always seemed to me that amalgamation in fine-grinding plants has never received sufficient consideration, as fine grinding gives an ideal product for amalgamation. I know that many of us old amalgamators do not like to lose an opportunity to use this old and simple process and have been rather too hard to convince that fine-grinding plants would do just as well without it; in any event, we still have scruples, and there is an army of us who are anxious to hear what anyone has to say about it.

Has anyone tried amalgamation in cyanide solution in pebble-mills? If so, what has been their experience? Would the troubles caused by the flowing of quicksilver on plates when amalgamating in cyanide solution be an advantage in pebble-mill amalgamation by preventing flouring? Cyanide keeps the mercury lively and cleans it to a certain extent. If a great excess of mercury were used thus, the amalgam would be in very thin solution, preventing the draining of mercury from the amalgam as mentioned by Mr. Caetani, or would it be so lively that it would drain all the more quickly? Would the use of a great excess of mercury when grinding in water prevent the discharge of amalgam? The loss by flouring in the latter would no doubt depend on the character of the ore, as discussed by Mr. Girard.

Guamoco, Colombia, March 7. K. C. PARRISH.

'Rock' or 'Ore'

The Editor:

Sir—What is the proper designation for the material which the copper mines of the Lake Superior district hoist from their shafts and send to their mills, and from which copper is extracted? Should it be called 'ore' or 'rock'? That is a question which frequently is discussed. In a magazine of such high standing as the *Mining Press* the word 'rock' is used with quotation marks, indicating that the copy-reader on your highly efficient technical publication considers the use of the word as a localism. In the latest edition of the Webster International dictionary I find the first meaning of the word 'ore' to be a "native compound containing one or more metals." Farther down, as a 'mining' definition this is given: "any material containing valuable metal constituents, for the sake of which it is mined and worked." From this second definition one would be justified, I presume, in calling the output of the Lake Superior mines 'ore.' From the first meaning there may be some doubt about that usage, for the reason that the copper here is not "compounded" with the material that comes up in the skip, the 'copper rock.' But if the use of the word 'ore' is permissible it seems reasonable to believe that the use of the word 'rock' may likewise be quite correct without even the taint of colloquialism or localism attaching to it. The same dictionary gives the first meaning of 'rock' as, geologically, "mineral matter of any kind occurring naturally in large quantities." The eighth meaning under a mining sub-head is "a large lump of ore." This is where the localism comes in, for this meaning is credited to Cornwall, England. And our mining vocabulary in the Michigan district is loaded with Cornish terms.

While such an authority as T. A. Rickard has taken the stand that the gross product of Lake Superior operations should be designated as 'ore,' and has expatiated at considerable length to prove the correctness of his assertion, it seems to me that there is nothing in error in calling this material 'rock,' and that the use of the word 'rock' does have an added advantage in discrimination. 'Rock' here is quite different from 'ore' in Montana copper mines or Arizona copper mines, where a chemical separation is necessary to secure the copper. While it may be correct to call our mine output 'ore,' certainly it is not incorrect to call it 'rock.' When we here speak of 'copper rock' we know it means the mine product that, when separated, yields native copper; and when we speak of 'copper ore' we know it means a product that requires chemical treatment to secure the copper.

HOMER ARAGO GUCK.

Houghton, Michigan, March 21.

[As Mr. Guck says, this is an old question. Having "expatiated at considerable length" on the subject on other occasions, the Editor is disinclined to trespass on the courtesy of his readers. As we understand this new defence of the use of 'rock' as a synonym for ore, it is argued that the copper in Michigan is native and therefore "quite different" from copper 'ore' in Montana or Arizona. But the gold in quartz veins is native also; why not call it 'rock'? The purpose of restricting terms to specific usage is to secure precision of language. The word 'rock' belongs to geology and covers any part of the earth's crust; the term 'ore' belongs to economics and involves the idea of profitable exploitation. In describing a Lake Superior mine, if 'rock' is to be used interchangeably for the substance of the copper-bearing lode and also for the enclosing country, it is likely that confusion will arise, especially in the minds of those unfamiliar with this localism. Whatever terms our good friends at Houghton may adopt for their local use, it is not for us to say; but it would be wrong for a technical journal to employ localisms likely to prove confusing in localities far from Lake Michigan. In other words, we try to use terms understandable, or likely to be understood, wherever the English—not the British or the American—language is spoken.—EDITOR.]

The Editor:

Sir—The subject 'What is an Ore?' has been reviewed and discussed in detail by Mr. James F. Kemp in a paper read before the Canadian Mining Institute, March 4, 1909, and published in the *Mining and Scientific Press*, March 20, 1909. I quote Mr. Kemp as follows:

"It is a time-honored conception of an ore, that it should consist of a metal in composition with some non-metallic substance, such as oxygen or sulphur, which disguises its metallic qualities and which is called a 'mineralizer.' Native metals are not 'ores' according to this

view. The copper of Lake Superior is therefore obtained from 'copper-rock,' not from ore. Gold is yielded by 'gold-quartz,' not by gold ore. But I think we must all feel that this old-time usage is no longer sharply observed and that it may well enough drop out. Thus in T. A. Rickard's interesting little book on 'The Copper Mines of Lake Superior' we certainly find the output of the mines referred to as 'ore'."

Mr. Waldemar Lindgren, in his recent book on 'Mineral Deposits,' says: "Local usage has adopted several terms as substitutes for 'ore.' In the lead-zinc district of Missouri crude ore is called 'dirt,' while concentrates are called 'ore.' In Michigan the ore is called 'rock' and the concentrates are termed 'mineral'."

Mr. T. A. Rickard in 'A Guide to Technical Writing' writes in his interesting style as follows:

"One more bungling term may be instanced, namely, rock, which is used among the copper mines of Lake Superior to designate ore. Not only do the Finns, the Hungarians, the Swedes, and the other folk ignorant of the English language employ this term, but the graduates from Columbia, Harvard, and Yale accept the sloppy usage. Ore and rock all over the world—except in Michigan—are set in opposition as signifying respectively, the profitable and the unprofitable product of a mine."

In a recent issue of the *Mining Gazette* here, the editor, Mr. H. A. Guck, brings out clearly the point of this discussion. He says: "When we speak of copper-rock we know it means the mine product that, when separated, physically, gives us native copper, and when we speak of copper ore we know it means the product that requires chemical treatment to secure the copper." Obviously, 'we' refers to the people of the Michigan copper district, and therefore, it may not be incorrect for residents of the Michigan district to use a local term when talking among themselves. But what about the others who live in various mining districts throughout the world and who, therefore, are not acquainted with the localisms of Michigan? Would it not be better and proper to use a term whose meaning is understood by men of all districts?

Numerous other undesirable localisms, such as the Australian 'reef' and 'paddock,' could be cited, but if technical papers are to be useful and clarity of expression is desired, these peculiar and local terms must be cast aside.

Houghton, Michigan, April 10. W. A. HOPPER.

[We are glad to have Mr. Hopper's support. These localisms in technology are only confusing. My old friends in Gilpin county, Colorado, speak of the *concentrate* of pyrite obtained in stamp-milling as 'tailings.' Shall we adopt that absurd localism? The Australian at Ballarat talks of 'rich gold,' when he means ore rich in gold. Is that to be accepted? The miner in Nevada gives the name of 'dirt' to the perfectly clean metal-bearing rock just broken by his pick; and he bestows the same label indiscriminately on rock that is barren and on that which is rich.—EDITOR.]

A Suggestion

The Editor:

Sir—In reading the 'Discussion' columns of your paper a certain thought has from time to time been suggested to me by numerous writers. This concerns itself with the courtesy and consideration that one engineer owes to another, especially in the public print of our journals.

It seems as though some writers wait until they have indigestion before expressing a difference of opinion. It is surprising how often letters of this harsh irritating type come from men whom I know personally to be of very limited attainments. Several letters that have made this impression on me came from men who were not bad fellows at all. The sarcasm, the personalities, the self-assertiveness were calculated to give force, but in reality detracted from the strength and dignity of the writer.

We owe something to each other, not only as engineers, but as gentlemen. Our success in life depends more upon our personality than upon our knowledge, so it behooves us, when advertising our personality in our writings to give some attention to what interpretation may be put upon this side of our contribution.

I refer not merely to the direct insults, which are frequent, but to those less glaring offenses that show a lack of consideration. We should remember that our technical press largely represents the spirit of the profession. I should dislike to have our profession judged by some of the vulgar and caustic letters that occasionally appear. That sort of thing never goes with the scientific frame of mind or any other frame worth imitating.

I have noticed this same lack of consideration for the other man's ideas in the utterances of certain speakers at a recent meeting of a scientific body. An engineer, especially a younger one, may write offering the solution of an interesting problem largely with the idea of drawing out better ideas and learning something new. In a great many cases before the matter is closed, he will be raked over the coals as an incompetent. That this is done by men who have made a special study of the question is only small comfort for the supercilious manner of it.

It also strikes me that this ungentlemanly attitude is never taken by our prospectors or by illiterate people, but by men who know how to handle English, and whose knowledge and understanding in general is worthy of consideration. Taking us as a profession, in our meetings and writings, are we or are we not a little negligent in some of the higher duties we owe each other?

In closing I wish to remark that I am not complaining from any experience of my own.

Salt Lake City, April 10. F. SOMMER SCHMIDT.

[We comment on this letter on another page. As stated there, this letter should not intimidate our readers from taking part in these discussions. We desire to encourage frank and polite criticism.—EDITOR.]

The Human Side of Mining

By JAMES F. KEMP

*All of us who are interested in mining and its fundamental science of geology, must feel that Keweenaw Point is classic ground. We are reminded of the early expeditions of the French, in parties from the lower St. Lawrence valley, consisting usually of a missionary priest, of a gentleman-adventurer, and of comrades not averse from trading with the Indians. Probably you all have seen in Foster and Whitney's report the reproduction of the early map prepared by the Jesuit fathers in the 17th century and sent back to France. Lake Superior, or Lake Tracy, as they then called it, is correctly drawn as regards all its larger features, so correctly in fact, that our admiration is greatly excited by the close and accurate work of these 'voyageurs,' so many thousands of miles from home in the bleak wilderness. We read their reports of copper among the natives and of the hopes of a mining industry in future years. Copper on Lake Superior and lead in southeast Missouri and in the Upper Mississippi valley were no small influences in the early colonial days. But who can say how far back pre-historic mining by the native tribes began, or how many centuries ago the blows were struck with those stone hammers that now from time to time we find on the outcrops of our lodes.

We people to whom mining geology means so much cannot be unmindful of the early work of the Foster and Whitney survey, nor above all and in particular of J. D. Whitney's contributions, since he was the forerunner and father of us all here in America. I wonder if you have read the fascinating book of his 'Life and Letters,' published within a few years past. In it we are taken behind the scenes and actually see the struggles of scientific men amid the forest-trails of the Point, and the storms on the Lake. We sympathize with their lack of maps, as they tried to prepare a good and accurate description of the geology. Whitney was storing up experience and, with the spirit of an apostle to the ignorant, was preparing the data for his monumental work, 'The Metallic Wealth of the United States.' Among his countrymen, ignorant as babes of mining, he sought to spread in 1854 sound information regarding their material resources and the proper and reasonable development of them. While Whitney had done some youthful geological work in New Hampshire and had studied abroad, yet we can readily see that the main courses in the foundation of his later work were laid in the copper and iron regions of the Lake country.

We have had another book within the last few years that is of unusual interest to all concerned with mining on the Point, and I doubt not very familiar to you all. It is the 'Life and Letters of Alexander Agassiz.' In it we learn of the tremendous struggle in the early years to place the Calumet & Hecla on its feet. Far be it from us who have seen the later prosperous days of this queen of copper mines, to be unmindful of the heroic years which marked its development, nor of the courage, faith, persistence, and devotion, which carried it through the initial stages.

I mention these qualities because they are characteristics which must be possessed by an engineer to a degree hardly equaled by the sister professions; and by the mining engineer pre-eminently among the different types of engineers. I wonder if you have ever thought of the contrasts which our profession offers to these other branches of engineering. Almost all of our colleagues, civil, mechanical, and electrical, are set to accomplish definite tasks. They build a railroad, design an engine, construct a dynamo, or a power-station. A problem in construction is theirs, and the elements of it are usually well known and definite. But we often have to discover and develop ore as we go along. We do not always know where it is ahead of us in the rock, or indeed if it is there at all. We are much more like the physician diagnosing an obscure disease. Our medical friend looks the patient over, learns symptoms, and infers causes. X-ray photographs may help him immensely and give him a look at hidden organs or bones, but after all, he needs a peculiar and keen intuitive reasoning power that is a rare and great gift. Medical schools prepare him not alone by information and disciplinary training, but also by clinics, wherein he sees just such cases as he is likely to meet, treated by skilful men who may even give him bedside practice.

We mining people have to deal with cases of abnormal conditions in Mother Earth. We have to treat stoppages of circulation and their results, strongly analogous to varicose veins in the human subject. We must now and then solve compound fractures and dislocations not of a half an inch, as in bones, whose sundered ends cannot slip very far past each other, but breaks and slips in the rocks which may involve movement of tens or hundreds of feet into the unknown. Compared with the surgeon, our one comfort is, that only in our imaginations do we have to put the broken parts back in their old, united positions. We may have only a little stringer to guide us; or the 'trail' of the fault in a fault-zone; or a slickenside; or a bit of gouge. In treating these difficult cases we must call to our aid all the lore of ore deposits. You remember how those old German mining geologists centring about Freiberg and Clausthal have written of the *'Lehre der Erzlagerstätten,'* or the 'Lore of Ore Deposits,' and how we English-speaking peoples from the days of the old workers in Cornwall to the present have passed along, with successive additions, the

*Abstract from address to the graduating class of the Michigan College of Mines, at Houghton, April 15, 1915.

accumulating experience of the past. Always in the back of our minds for the ordinary run of orebodies we have the belief that some sort of solution has found a line of circulation and has brought in the useful minerals. We try to reproduce in our minds the way the old solutions behaved and to explain to ourselves why they followed the special channels that guided them. We constantly seek the cause or conditions that made them drop their burdens of dissolved minerals at some places and not others. Sometimes an intersection of fissures may have led solution and precipitant to mingle. Sometimes an open-textured relatively soluble rock may have itself served as precipitant. Sometimes loss of heat and waning pressure seem to have influenced uprising heated solutions, which Agricola nearly four centuries ago called 'the juice of the earth,' and which we often call today 'the juice of the magma.' These or similar questions are in our minds when one orebody is exhausted and we have to look for others.

Orebodies resemble troubles in the system, for which the physician prescribes in the ordinary run of practice. But there are other cases which call for the surgeon. Let us suppose that our orebody is cut off by a fault, we need to know how faults customarily move and how we may decide where to look for the lost continuation. What are the trail, the drag, the slickensides, the gouge, the fault-breccia, and what do they mean? What do our old-time authorities tell us—Schmidt the Swede, Zimmerman and V. Carnal the Germans, and, in recent years, Freeland, our fellow-countryman? We must not be too much taken up by the machinery used in mining, with its enormous development in later years, and be unmindful of the old accumulated experience of the fathers gained in many years of laborious underground work. Hoover's translation of Agricola has placed at the command of all English-speaking peoples a wealth of ancient learning brought together by Agricola about 365 years ago. You would be surprised, if you have not read the book, to note, on looking it through, how much the ancients were like the moderns, and how very acute they were in their observations and inferences. Even our devices for hoisting, pumping, and ore-dressing are foreshadowed in Agricola's pictures. The miners and metallurgists of his day had no steam-power, nor did they understand chemistry as based on the atomic theory, much less the doctrine of ions, but they utilized the forces at their command with rare skill and they usually left singularly clean slags, when they had reasonably simple ores to smelt.

But I did not mean to digress too far in speaking of our predecessors nor to do more than to urge you to hold them in grateful and appreciative remembrance. We are living in the present and after the preparation in the professional schools we each have a man's work to do in the world.

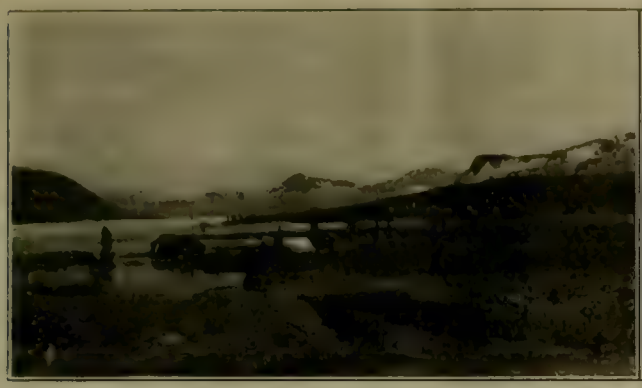
In all our schools we have professors of the various sciences and of the arts involved in mining and smelting, and yet there is one professorship which we do not have, despite the fact that we might almost think it the chief chair of all. I have in mind a chair of that indefinite thing or body of personal experience or attitude of mind toward one's fellows and associates which we sum up in the term 'life.' You see we are not machines whose horse-power can be calculated and which run on their monotonous round until they wear out. Back in the late eighties I passed five happy years in the faculty at Cornell. My old friend and older colleague, Professor R. H. Thurston, the Director of Sibley College in those days, used to rather enjoy defining a man as an engine who could consume a certain amount of fuel under his boiler and deliver a certain amount of work from his muscles and brain. But we know very well that this is only a half-truth. A man has a personality, a spirit, a disposition, a character, a sphere of influence, that are quite distinct from the number of shovels full of ore that he can heave into a car if he is 'mucking'; or the number of traverses he can turn off if he is surveying. It makes no difference to an engine whether its nearest neighbor is 10 horse-power or 10,000, or whether it has a cut-off or simple slide-valve; or whether it was built by Nordberg or Leavitt or Lidgerwood. But it makes a world of difference in a community of people whether a man in power is considerate, just, and sympathetic; or whether he is unscrupulous, selfish, and faithless. Or whether again he who is a leader, is easily discouraged, or disposed to lie down on the job, shirk responsibilities, and to take duties lightly. All these matters are of exceptional importance to a mining engineer, who may, as he gets on in the profession, be not only in charge of the technical work, but, if he is in a remote community, may be mayor, board of aldermen, school commissioner, provider of food and clothing.

Yet with all these provisions for material and intellectual welfare, there is one other side which we cannot overlook, and that is, amusement for idle hours. We never trouble our minds about a man when he is busily at work, but we are justly concerned about him when his day or night shift is over. For miners who are underground during their working-hours in dark and often wet stopes and drifts it is of more importance than for other workers to have some sort of wholesome recreation available whereby to pass an enjoyable evening. If, as we all have seen in little remote settlements, there are only the boarding-house and the bunks, we find the miner storing up his craving for a change until the end of the week or month, and concentrating in a short wild period what should have been taken in diluted and harmless instalments over days or weeks. The Young Men's Christian Association is taking up the matter vigorously and agitating the establishment of club-houses which will supply social centres, often in charge of a specially qualified worker. In the American Institute of Mining Engineers we have the past year been lending a sympathetic ear to one of their officers, Fred W. Rindge by name and engineer by training, who is specially looking after the work in the mining communities.

And yet we must be prepared to have these welfare movements misunderstood and to find our best intentions regarded at times with suspicion and disfavor. Experience leads us to expect it but we must be strong enough, and far-sighted enough, and persistent and unselfish enough, to discreetly and wisely work for the good of a community despite the rebuffs.

I have endeavored to draw the parallel between the mining engineer and the physician. But there are other features of a mining engineer's work which we must not overlook. He is a sort of combination of overalls and dress-suit, and he has to be equally at home in either. He must put on the former if he knows both what lies underground and what goes on underground. Several years ago I was out in Butte one summer with H. V. Winchell, one of your old-time Superior men, and with J. W. Finch of Denver. We were looking over the geology of the Steward mine with great care. Now at Butte in those fault-veins, through which, as channels, have certainly coursed great flows of hot waters, a soft clay-gouge is very abundant. In old and wet workings it makes an emulsion or a thin syrup of fine particles that is first cousin to paint. We three had crawled through the old drifts of this character all day and had come up about 4:30 in the afternoon, and so stepped off the cage just as the 'Seeing Butte' car had deposited its load of Eastern school-marms, and various other kinds of tenderfeet, all in charge of an orator with a megaphone. The Steward was the mine to which they were habitually taken. "Ladies and gentlemen," said the orator, "this is the Steward mine, where many of those wretched miners work far underground, whose little cabins I showed you out on the flat. It is wet and dirty underground and"—catching sight of us, he added, "there's three of 'em now." We certainly looked the part and tried to keep straight faces until we could slip into the change-house. What we had seen, however, embraced three sets of remarkable faults, which had developed one after the other. We had seen the oldest vein displaced by the next; and shifted to one side by the last. We had been so keen in the study of this geological structure that I do not believe it had occurred to one of us that our surroundings were wet or dirty. As my colleague in mechanical engineering at home, once said in my hearing, "When we are working over an engine in our old overalls and in the grease and heat, we never think of either of them. It's the idea that fills our minds. The design or plan that makes the engine go, that excludes all else." And so it is with us amid the discomforts of the work, if we may call them so. We forget them, our minds are so filled with the systematic attainment of results or with the study of the geologic structure of the veins; or with the forecasting of what will happen to our ore on the next level; or with the needs of the community of workers; or above all with satisfying the board of directors on whom, back in the central office somewhere, the manager must always have a wary eye. With the last consideration, the dress-suit side of the profession comes in. Not only must our man in authority look out for his miners, but he must be just as ready to meet his directors on equal terms. He may live most of the months in the remote community, but with the revolving year comes around the time of annual reports, of conferences, of presenting in person the results of operation; it may be also of hospitalities extended and social courtesies; of meetings with the Institute of Mining Engineers and mingling with one's fellows, and then we have to shed the overalls in favor of the dress-suit. One must guard against too much overalls, and not let the stiffly starched bosom choke too hard at the neck, because of disuse. Some young engineers are a little inclined to overdo the overalls phase of the profession, whereas we should be good companions with all sorts and conditions of men.

To my mind, the most trying time with all of us is at the start. Almost every young engineer has several unsettled years before he finds a permanent place. While this experience is not invariable, it is the rule. The new entrant into the profession is getting experience and is taking a course in that subject of life for which we have not and cannot have a professorship. In the long run, however, all the years total up their contribution to the final result and most men of maturity are loath to admit that any of their experiences have been without final use. It is not a bad plan for a young engineer to look himself over and see what value he would really place upon himself to his company. It takes time to get broken in and to learn the routine. No harm is done in assuming the employer's point of view and seeing if, with conditions reversed, we ourselves would give any more for the service. Everyone, and especially the beginner, may properly wish to give full equivalent for compensation received. A subordinate may often wisely in his imagination put himself in the position of his chief. Live his daily round, think over his responsibilities and harrassing cares, and then see what can be done to make them a little less burdensome. Most of the men whom we know, partly from individual characteristics, partly from the pull of outside influences, come to revolve in fairly definite orbits. If we secure and use a sufficient number of observations, we can calculate a particular orbit, just as do the astronomers in dealing with a planet. We can with a little study and foresight know where to find our man at different times of the year and under the circumstances produced by any conjunction of known forces supplied by outside influences. Can a junior thus forecast what his chief will need and be unostentatiously ready; if he can avoid asking too many pestiferous questions of a busy man, he will certainly secure the appreciative gratitude of his chief. Let me whisper to you that even among professors often kept under keen nervous strain by the demands of classes and by the consuming desire to have their subjects understood by the young people before them, the foresight of an assistant who knows where are all the specimens or apparatus to be used in illustration, and has them ready without undue oversight, comes as balm to excitable nerves.



No. 1. THE DAM.

No. 2. THE DITCH.

Hydraulic Mining at Atlin

By A. D. HUGHES

INTRODUCTORY.—These operations in British Columbia are believed to be of sufficient magnitude, and the conditions existing, methods employed, and results obtained sufficiently unusual to warrant the publication of this article. Similar conditions may exist at other places, and, if so, the method worked out here may be of use to others. Actual working costs are given and enough of the data governing them to make possible an approximate estimate of the expense of similar work in other districts.

The description covers the operations of the North Columbia Gold Mining Co., of Cincinnati, during the four seasons from 1910 to 1913 inclusive. The work was carried on under the management of J. M. Ruffner. I was present during the whole of this period, and during the latter three years acted as superintendent. The data given are therefore authentic and represent the result of observations at all stages of the work and under all the conditions obtaining.

Atlin is situated near the northern border of British Columbia, about 60 miles in a straight line southeast of Carcross, Yukon, which is 70 miles from Skagway, Alaska, on the White Pass & Yukon Railway. It is reached from Carcross by boat on Tagish and Atlin lakes between June and November. There is a portage between the two lakes, freight and passengers being transferred on a railroad three miles long. During the winter, dog-teams or horse-stages, depending on the condition of the ice, carry mail and passengers to and from Atlin. The climate is that usual at this latitude behind the coast range.

Gold was first discovered in the district at the time of the rush to Dawson. In the years immediately following there were as many as thirty or forty thousand people in the camp at times. Individual mining was then at its height, work being carried on in the creek-beds and shallow benches. Since that time the population has been decreasing gradually, as individual work has been giving place to large-scale operations. At the time considered there were about 1500 people in the locality during the summer and much fewer, of course, in the winter. The production during the time mentioned was about $350,000 per season. The operations to be described produced the bulk of this output, the remainder coming from smaller hydraulic plants, drift mining, etc., on the various creeks within a radius of 20 miles from Atlin.

Pine creek, the scene of the operations, runs from Surprise lake at the head of the valley, and empties into Atlin lake, a distance of 12 miles. The fall in this distance is approximately 750 ft., of which 100 ft. is gained at a waterfall about four miles from Atlin lake. The average grade of the remainder of the course is therefore about 1%. Midway between the two lakes is situated the Discovery claim and the town of Discovery. Here the valley is broad, with wide benches on both sides of the creek. From a short distance below this point to a mile above there is exposed a section of an old river-channel. It is from this channel that all the gold on Pine creek has come. It is from 400 to 800 ft. wide. The present creek has cut through this for approximately the entire length of a mile and a quarter and a width of 100 to 150 ft. The old channel slopes in the same direction as the present creek with a grade of 1%. The present creek has a grade of a little less than 2% at this point. The level of the bedrock in both the new and old channels is the same at the upper end, although there originally was a difference of about forty feet in elevation between them at the lower end. Early ground-sluicing operations and drifting filled a large part of the available dump at all points.

Bedrock on Pine creek at this point is mostly serpentine, through which there are many dikes, in vari-

ous stages of alteration. Along these dikes and through the serpentine there are many quartz stringers, some of which are known to carry gold. The erosion of similar rock probably furnished the placer gold. The nature of the gold bears out this theory, as much of it has quartz associated with it. Some of these small quartzose nuggets are well rounded and some of them appear to be freshly broken.

The North Columbia Gold Mining Co. came into existence during the early days and acquired ground on the south side of the creek, the area eventually comprising most of the old channel on that side. Operations were then conducted on a small scale. The water system consisted of two small ditches of about 1000 inches each, one on each side of the creek. During the first few seasons a good deal of material was run into the creek, and it became evident that space available for tailing would soon be exhausted. Experiments were tried with different methods of handling tailing, and during this time the method of stacking on worked-out bedrock by means of monitors was tried. Results were better by this method, but the capacity was limited by the small water-supply. There was an abundant supply at Surprise lake, and in 1907 it was decided to build a ditch and dam to make this available.

Surprise lake is a natural reservoir at the head of Pine Creek valley. It is 16 miles long by a little over a mile wide, having an area of about 18 square miles. A crib-dam was built to conserve the flood-water in the spring, the ditch being constructed during 1907 and 1908. This ditch was dug with a floating steam-shovel built by Fairbanks of Marion, Ohio. It is 6 miles long, 30 ft. wide, and has a 4-ft. bank in solid ground at the lower side. The grade is 8 ft. per mile. No fluming was necessary, and good ditching-ground was encountered. The line of the small ditch previously used was followed. Waste-gates were placed at intervals of three-quarters of a mile, one set of these about half-way being arranged so that the entire head of water could be turned out at this point. The cost of this ditch was $6285 per mile, including the dredge, for which there was no further use when the ditch was completed. The dredge cost $13,732 erected and ready to run.

In 1909 the crib-dam was destroyed during the high-water period and was replaced by a pile and earth-work dam that was started at once and was completed in time to save a large part of the water in the lake. The new dam is about 400 ft. long and 12 ft. high at the centre. The piling extends for about 150 ft. at the deepest portion. The width on top is 12 ft., this being used for a roadway. The gates are operated with a screw-stem similar to a hydraulic gate-valve. The apron and spill-way from the gates is 30 ft. wide. The cost of the new dam completed was $8158. It is shown in the accompanying photograph, No. 1, in which a portion of the old dam may also be seen. Photograph No. 2 gives a view of the ditch.

In 1910 the water-system was in good order, arrangements had been made for additional ground on the north side of the creek, and operations were started. The work was conducted from two separate pits, one on the south side of the creek opposite the town of Discovery and the other about a half-mile up-stream on the north side. The water for both pits was taken from the main ditch, which is on the south side. There was about five feet of water above the sill of the gates at the lake, and with the constant supply coming from tributary creeks a steady flow of about 10,000 miner's inches of water was reasonably certain.

Working Conditions.—The conditions existing at this time may be summarized as follows:

The No. 1 pit had been previously worked and was well opened-up. The bedrock had an average elevation of 20 ft. above the surface of the material in the creek-bed. The bank to be worked was in places 500 ft. from the creek. The bedrock had a slope of about 1% down-stream and was practically flat otherwise, although in places there was a slight rim between the creek and the main part of the channel. The average depth of the material to be worked was 60 ft., consisting of 10 to 20 ft. of channel-gravel, 20 to 40 ft. of Glacial clay, and from 1 to 10 ft. of loose soil, surface-gravel, etc. The channel-gravel is hard and tight, contains many boulders, is a bright yellow color, and in places is almost cemented. The Glacial clay is a compact material containing a considerable amount of rock. It is not so sticky as the ordinary varieties of clay. Water, however, will not cut it. It must be undercut and caved. The head on the water from the ditch at this pit averaged about 140 feet.

The No. 2 pit had not been previously worked by the method contemplated, and the work here for the first year was largely experimental. The bedrock had an average elevation of 10 ft. above the surface of the material in the creek. The ground here was shallow, running from 5 to 30 ft. deep, and consisted almost entirely of the channel-gravel. The bench to be worked extended from 300 to 400 ft. back from the bank of the creek. Some of the shallow ground had been worked over by hand and a portion of the deeper ground had been drifted. The bedrock had a slope of 1% down-stream and about the same amount toward the creek. The head from the ditch at this plant varied from 100 to 120 ft. There is no permanent frost in the district.

It is evident from the conditions mentioned that the method of working must not be such that any large amount of the coarse material in the banks would be put into the creek. The grade of the latter made it possible for a small proportion of the finest material to run off at all times under the large head of water employed. From 20 to 30% of the material was thus taken care of, without affecting the condition of the creek. This percentage was greater at the No. 1 pit, as the additional water from No. 2 increased the amount in the creek at this point to about 10,000 inches.

The general equipment and the conditions under which the company operated will be described first, then a typical season's run for each pit, giving the equip-

ment employed, followed by a detailed account of the cost in the two pits as it averaged over the four seasons.

All work was handled from the town of Discovery. The buildings consisted of office, boarding-house, bunk-houses, living-houses, warehouses, stables, saw-mill, and blacksmith and machine-shop. The office was connected by telephone with the two pits and with the cabin of the ditch-tender at the lower end of the ditch. It was not found advisable to keep a man at the dam, as the flow of water was uniform. When the pits were shut-down, while moving plant, etc., the water was shut-off at the lake, but for small variations the excess water was allowed to run to waste at the lower end of the ditch so as to be immediately available when desired. The amount of water in the ditch was kept as nearly as possible to the amount used when both plants were running at full capacity. A driving horse and one work-team were kept all the time. The saw-mill would handle about 2000 ft. of lumber per day. Logs were hauled in during the winter, on contract, or by the winter watchman, sufficient lumber being cut at one time to last for two seasons. It was necessary therefore to have a special saw-mill crew only once in two years for about two months. Rough native lumber costs about $30 per thousand at the mill. The blacksmith and machine-ship contained a 16 in. by 8-ft. lathe, drill-press, hack-saw, emery wheel, forge, etc. Power for this was supplied by a small Pelton wheel. The pipe-line furnished water from the small ditch on the north side of the creek, at 75-ft. head. The same pipe-line furnished water under pressure for the buildings and also for a plant generating electric light. A 15-kw. Fairbanks 110-volt direct-current generator was belted, with counter-shaft, to a 4-ft. Pelton wheel receiving water at 75-ft. head through a $2\frac{1}{2}$-in. nozzle. This plant furnished power for about 100 incandescent lights for the buildings and for three arc-lamps used at the No. 1 pit. Owing to the distance and the consequent loss in voltage, it was not found practicable to run lights from this plant at the No. 2 pit. Another generator was erected at this pit, operated in the same manner, furnishing power for three arc lamps and a few incandescents. These plants gave no trouble when properly equipped with oil-cups on all bearings. The light was satisfactory and the cost nominal. They often ran for 10 or 12 hours without any attention.

MAP OF BRITISH COLUMBIA, SHOWING POSITION OF ATLIN.

Starting to Work.—During the four years considered there was but little variation in the dates of starting preliminary work, namely, April 18, or that for starting sluicing, May 10, and closing down, November 10. One season's work is typical of the others. A start was made from Vancouver about April 5, the party consisting of the manager, superintendent, accountant, foremen for the different pits and shifts, machinist, etc., and a few Japanese for cooks and roustabouts. A few of these were used for work in the pits, an occasional one showing good ability. From Carcross to Atlin and Discovery the trip is made with horse-stages over the ice on the lakes at this time of year. Men were first put to work on the ditch. At one point a glacier forms in the ditch for about 1500 ft., this being caused by a spring on the side-hill above. A trench $2\frac{1}{2}$ ft. wide is cut through this at the centre. This is done with dynamite, supplemented by pick and shovel. A small amount of water was turned out of the lake while this work was going on and allowed to run through a waste-gate above the glacier. This cleared the upper part of the ditch of ice and snow in a few days. When the trench was completed a small head of water was turned through it, this being increased as the ice cut out and was melted by the action of the water. The rest of the ditch cleared itself by allowing the water to run during the preliminary work. When the plants were ready for the full head of water, about May 10, if there was any large amount of ice overhanging at the sides of the ditch this was shot-down and

passed the waste-gates before turning water into the pipe-lines. Otherwise the pressure-boxes or penstocks might have become choked with ice and caused trouble.

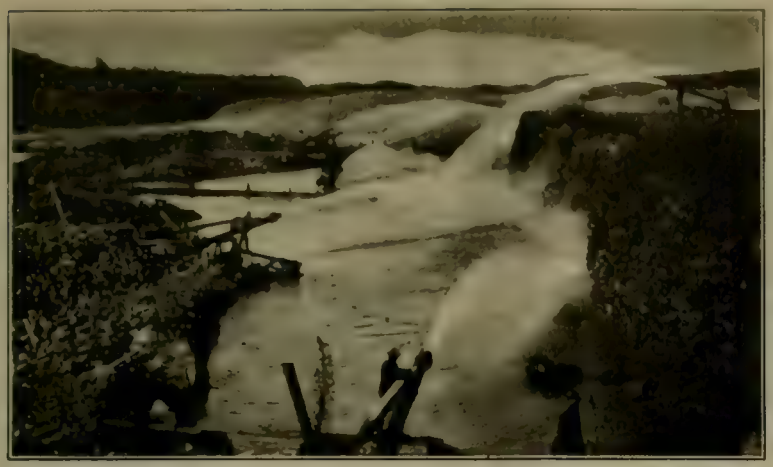
As soon as the weather conditions permitted, 20 men were started to work in No. 2 pit. Usually there was one of the main pipe-lines to be moved. This made a new pressure-box or penstock necessary. As much excavation as possible was done during the preceding fall to avoid excavating in frost in the spring. The remainder of the ditch-berm was now cut through, the intake to the pressure-box constructed, and the gate put in, so that when water was turned into the ditch to clear out the ice no damage would be done. At this plant the pressure-boxes were built as close to the ditch as possible, usually about 30 ft. The flume was made 5 ft. wide and about 6 ft. deep. The pressure-box dimensions were 8 by 16 ft. inside and 12 ft. deep. The sides of the box and flume were brought well above the water-level of the ditch, so that they required less attention. When a monitor was turned-off in the pit the water would back up and run down the ditch to the end, where the ditch-tender could turn it out. In this way it was not necessary to keep a man on the ditch at this plant.

Two main pipe-lines were used, each about 1500 ft. long, consisting of 30, 28, and 26-in. pipe to the main Ys at the pit. They consisted of 12 and 14-gauge slip-joint riveted pipe made by the Hydraulic Supply & Manufacturing Co. of Seattle. These lines were set in a temporary fashion, as there was nothing permanent about the location. One season's run was about all that could be obtained from one setting of the lines. It was necessary to put both of these lines across the creek on trestle-bridges. From the main Ys the pipe was reduced to smaller sizes to run to the monitors. This pipe was of 14 and 16-gauge, mostly 16 and 18-in. diam. Eight monitors were in use, five No. 6 machines, 15-in. intake, and 6-in. nozzles, and three No. 4 machines, 11-in. intake and 5-in. nozzles. Each machine was equipped with a deflector and each pipe-line with a gate. Nearly all the monitors were ball-bearing Hendy machines. Four machines were operated on each of the main lines. The arrangement of the monitors is shown in photographs No. 3 and No. 4. A cut was first made from the creek by blasting and then piping the broken rock out. The flume was set in this with the head-end practically on the level of bedrock. Wing-dams were built at each side, and strongly braced. Before starting to run dirt the machine on top of the bank was used to pipe a reef of top dirt around the unconfined sides of the pit so that no water could escape. The flume used here was 4 ft. wide with sides 3½ ft. high. It was set on a grade of 4 in. to 12 ft. and equipped with angle-iron riffles throughout. The first box was built tapered, being about 6 ft. wide at the head end.

In Full Swing.—With the sluice completed, and the machines all set, water was first turned on May 10. One monitor was always placed so that it could pipe the material directly into the head of the sluice. This was necessary as none of the material would run in the usual way on this grade. The other machines were strung out in tandem about 50 ft. apart, and kept the bank worked back in approximately a straight line, as shown. The quantity of water used would carry the material through the flume on the grade given, and at the end of this three machines stacked the coarse material, as indicated in the photographs. The first of these was placed about 25 ft. from the end of the flume and the others at 50-ft. intervals. The arrangement of the tail-race in an arc increased the space that it was possible to fill with tailing. As stated, the water used was under a head of about 110 ft. The tailing-piles shown are 25 ft. high. They contain about 60% of the original material. The remainder was sand, which ran off to the creek. A portion of the finest of this was carried down the creek and the remainder deposited as sand-bars in the creek-bed below.

Photograph No. 3 was taken during the latter part of the work and shows the tailing-piles on the worked-out bedrock down-stream. They look very much like dredge-tailing. In stacking tailing by this method the best results were obtained when elevating the nozzle three to four times per minute, and elevating and lowering the stream at a uniform rate. The stream is brought down into the tail-race each time and elevated to the full reach of the man. During a portion of nearly every day the water in the pit was turned off. The bedrock was then exposed in most cases. When it would not drain, one machine was turned on and pointed toward the flume. This would draw the water down a foot or more. In the ordinary way of running as shown, the force of these streams would not cut the tight material on bedrock. With the water out of the pit, shallow holes were put down in this material and blasted with a small amount of powder. After being thus shaken up, one machine at a time was turned on; this material could then be cut and piled ahead near the flume, to be put through when all the water was again turned on. During this time also the boulders were broken by bulldozing with 75% powder. There were many of these, and several rounds of from 75 to 100 shots would be fired in a single day. When it was necessary to move the machines, it was also done at this time. In such shallow ground it was necessary to move at least one machine nearly every day. While this work was proceeding in the pit the men on the dump machines (so called) would put up a staging to stand on, elevate the streams higher than under the regular running conditions, and pile tailing back as far as possible, thus making room for more. All the material was put through the flume, the boulders being reduced until small enough to be run through with the other material. No derricks or similar devices were used.

It was found that a pit of about 30,000 cubic yards was the most economical size. This was governed by the tailing-room. The pit was kept as free from loose dirt as possible, the material being cut from the bank and piled ahead toward the flume only as fast as it



No. 3. TAILING-PILES.

could be put through. Some of the gravel was so tight that it was impossible to cut it any faster with water under the pressure available. The actual running-time for a pit of this size was about three weeks. One week would be consumed before the next pit could be started. During this time the clean-up was made, the bedrock around the head of the flume was cleaned by hand, a new bedrock-cut was made to the creek, the sluice moved and re-constructed, and the monitors moved to the new site. Thus each pit took about a month; as the open season lasted six months, six pits on the average were run per season. The actual excavation per season for the four seasons was 178,580 cubic yards.

No. 4. MONITORS IN FULL OPERATION.

No. 5. AT THE END OF A RUN.

To get the maximum efficiency on this work it was necessary to keep the monitors as near the face as possible. Thus the moving became an important factor governing the speed of the work. It was found that this could be done rapidly if the pipelines were arranged so that the moves could be made straight ahead. This was done as much as possible. The No. 6 machines weigh about a ton. Under the best conditions the time consumed for taking down the machine, skidding it ahead, setting it up, and bracing it ready for the water to be turned on was one hour. When elbows had to be placed in the pipeline or other adverse conditions existed, it took longer than this.

THE GOLD in this gravel was nearly all at or near bedrock. Some of it was in the crevices of the bedrock. It was therefore necessary to cut down a foot or two in order to make a satisfactory recovery. The action of the numerous streams piling the dirt ahead toward the flume, thoroughly disintegrated any of the tight material, so that the gravel was well washed by the time it reached the flume. The gold was fairly coarse and was easily saved. Quicksilver was used in the riffles at all times. In cleaning up, about 75% of the gold was recovered in the first 35 ft. of the sluice. About 10% of the gold was recovered from the bedrock immediately around the head of the sluice; that is, within a radius of 40 ft. Tests proved that

it did not pay to retard the work to clean the remainder of the bedrock by hand. No recovery could be made from it except at the time of moving the plant, as it would be covered with tailing when the next pit was started.

The crew for this work was a man for each machine, one flume-tender, and one foreman, making 10 men on each shift. Two shifts were employed, working 11½ hours each, making 20 men on the regular work. When moving plant and for other incidental work, extra men were employed, usually 4 to 6. All except the foremen were originally inexperienced at this kind of work, being the usual class of foreign labor found in similar localities. About half of the old hands returned each season, which made it easier to break in new men.

In No. 1 pit two main pipe-lines 2000 ft. long were used. These consisted of 30, 28, and 26-in., 12 and 14-gauge slip-joint riveted pipe. From the main Ys this was reduced to 16 and 18-in. pipe of 14 and 16-gauge. There were four No. 6 monitors in the pit, equipped with deflectors and 7-in. nozzles. There was a gate on the pipe-line to each machine. Two No. 6 monitors with 6-in. nozzles were used on the tailing. During a portion of the time a No. 4 monitor was used either on the tailing or in the pit as conditions warranted. The usual arrangement of the machines is shown in photograph No. 6. This photograph shows the two monitors on the tailing, and the tailing pile as it appeared near the end of a run. Owing to the greater head on the water at this plant the tailing could be piled to a height of 35 ft. The tailing constitutes about 40% of the original material.

The conditions regarding grade and bedrock, the occurrence of the gold, etc., were similar to those in No. 2 pit, except that owing to the greater distance from the creek, longer bedrock cuts were at times necessary. These were made by blasting and piping the material with the monitors in practically all cases. The flumes or sluices here were 5 ft. wide, 3½ ft. high, and from 125 to 400 ft. long. They were equipped with 10 by 10-in. block-riffles with 3-in. strips between. The grade used was 4 in. per 12 ft. It was found that this was the smallest practicable grade. In places where this grade was not available, the flume was shortened. The material in the tail-race would run on a flatter grade. Some portions of the deposit farthest from the creek had to be left unworked, as sufficient grade was not available even under these conditions.

Water was first turned on at this plant about May 10. The bank was caved by cutting in the gravel deposit as high as possible. As fast as it was brought down the material was run out. The bank of about 60 ft. was very tight and would stand practically straight. Usually the material when under-cut would drop down into the pit near the bank. Occasionally slabs of clay containing 1000 yd. or more would crack from the bank and fall outward into the pit instead of dropping straight down. This was a source of considerable danger. With the pressure available (140 ft.) the monitors would not work effectively at a greater distance than 80 or 90 ft. from the bank. While one of these slabs of clay could not actually fall on one of the machines, the force of the fall in water and fine material in the pit would shoot out a sheet of water, air, and sand with great velocity, sometimes doing considerable damage and placing anyone in the vicinity in serious danger. Fortunately the layer of sand and soil at the top of the bank usually gave ample warning when a cave was about to occur. Unfortunately one fatal accident happened during this period, due to the man remaining at the machine long after ample warning had been given that the cave was about to occur. No other injuries resulted, but considerable delay was caused owing to machines being damaged and pipe-lines displaced.

Boulders were not so numerous here as in the other pit, but much of the clay, remaining in lumps, had to be shot. Owing to the rock included and the brittle nature of the clay, the effect of powder when placed in a hole in the clay was much greater than would be imagined. During a portion of the time in this work, a small Sullivan compressor was operated. Air was used at 100-lb. pressure to run two or three of the small hand-hammer drills. The compressor was belted to a 4-ft. Pelton wheel, which received water from a branch on the main pipe-line. The usual hollow drill-steel was used for putting holes in the largest boulders, and pointed bars were used for putting holes in the clay. These bars were made at the shop on the works, with a shank similar to the drill-steel. Having been driven into the lumps of clay, they were taken out with a wrench made for the purpose. This was much quicker than putting in holes by hand; in the case of the boulders a great saving of powder resulted, as one stick of powder placed in a hole in the boulder had as great an effect as 8 or 10 sticks placed on top. Where powder costs 30c. per pound this is a big item. It was found, however, that it did not pay to retard sluicing long enough to drill all the boulders. Drilling was therefore resorted to when it could be done while sluicing was in progress. This was often possible by working on alternate sides of the pit.

Results.—Five pits, averaging 55,000 to 60,000 cu. yd. constituted the average season's run at this plant, the yardage for the four seasons being 283,300 per annum. The moves from one pit to another were as described for No. 2 pit. The crew here was 18 men on both shifts, with extra men as needed, and work was carried on as continuously as possible throughout the season.

During the progress of the season, usually after the high-water period, the material that unavoidably collected in the creek-bed at both plants, was boomed or flushed out by opening the gates at the lake and allowing a head of 30,000 to 40,000 inches additional water to run down the creek. When the maximum effect had been attained, the extra water was turned off. This operation was carried on as many times during the season as the available water-supply would permit, usually about twice, and for periods of about six days each time. It is worth noting here that although this extra water cut

out and carried away nearly all the fine material that had accumulated, the creek never could be cut down to the level previously existing. This was due to the fact that some coarse material unavoidably worked down into the creek bed. The effect was therefore a gradual increase in the height of the creek-bed, depending upon the amount of coarse material allowed to run into it.

At only one time during the period mentioned was there any shortage of water. During 1912 there was not enough to allow the use of it for flushing the creek, and at the close of the season, with all the gates at the lake wide open, only sufficient water was furnished for the full operations of both plants. However, during the winter the usual rise of about one foot in the level of the lake took place. This was enough to allow operations to be started on the usual scale in the spring, and heavy rains again made an ample supply, both for the usual operations and for flushing the tailing from the creek. Six feet was the maximum variation in the level of the water in the lake during the time considered.

The close of the season for both pits came at the time when ice forming in the ditch and pipe-lines made op-

No 6. MONITORS WORKING ON TAILING.

eration impossible. This usually occurred about November 10 with the temperature around zero. At this time the gates at the lake were closed down tight to avoid any waste during the winter, the plants were dismantled, and pipe, monitors, etc., placed on high ground, so that they would not become ice-bound during the winter.

WAGES.—A variation made in the manner of paying wages may be of interest. The usual wage for the camp is 35c. per hour and board, which is worth $1.50 per day. During the first part of the work it was found that there was a tendency for men to quit about the time in the fall that the weather became severe. This was usually in October when there was about a month's time left available for operating. At this time there were few available men in the camp, and the last month's work would therefore have to be carried on short-handed. To remedy this situation a sliding scale of wages was adopted with a bonus at the end of the season. The first two months was paid for at the rate of 25c. per hour, the next two months at 30c., and the remaining time at 35c., the usual rate. Board was furnished as usual during all the time. To those who remained throughout the season, a bonus was paid, bringing the total amount received by each man up to 35c. per hour for all the time employed. Steady men were desired, for a green man was not of much use on a machine for a month or more. It will be seen that the amount at stake for each man who had worked the greater part of the season was about $100. This proved to be sufficient inducement to remain, and henceforward each season was finished with practically a full crew.

OPERATING COST.—Average operating data, total costs, and costs per cubic yard are given in the following tables. A description of the governing factors is necessary. The scale of wages has been given above. All supplies may be considered as costing twice as much as at Vancouver or Seattle.

AVERAGE OPERATING COSTS, NORTH COLUMBIA GOLD MINING CO., ATLIN, B. C., CANADA. SEASONS 1910 TO 1913 INCLUSIVE

	Pit No. 1.	Pit No. 2.
Possible running time, days per season.	184	180
Actual operating time, days per season.	154	141
Cubic yards worked per season	283,300	178,580
Yards per day for season	1,540	992
Yards per day for time run	1,840	1,266
Miner's inches used per day	4,500	4,250
Yards per inch per day running time	0.41	0.30
Average depth of ground	60 ft. 6 in.	16 ft. 4 in.
AVERAGE TOTAL COST PER SEASON		
Labor	$20,789.53	$23,745.12
Powder	3,968.71	3,490.85
General operations	6,175.86	5,487.47
Ditch maintenance	624.75	624.75
General expense	1,249.50	1,249.50
Royalties, rentals, etc	1,383.95	1,145.77
Total	$34,192.30	$35,743.46
AVERAGE COST PER CUBIC YARD		
Labor	7.34c.	13.29c.
Powder	1.40	1.96
General operations	2.18	3.07
Ditch maintenance	0.22	0.35
General expense	0.44	0.70
Royalties, rentals, etc	0.49	0.64
Total	12.07c.	20.01c.

75% dynamite cost 30c. per pound delivered at the mine.

No boarding-house expense appears separately, as this was charged directly to the different operations each month and therefore is included in labor charges.

General operation includes supplies, wages of teamsters, blacksmith, etc., and other operating expense not directly chargeable to either pit. This expense was equally divided between the two pits at the end of the season, except such charges for supplies as were directly charged to either pit.

General expense includes traveling, office, and other incidental expenses not directly connected with the actual operations.

Ditch-maintenance includes all expense on the ditches in the way of repairs, etc. It does not include the wages of the ditch-tender, as this was charged directly to No. 1 pit.

Royalties, rentals, etc., include the Government tax on gold, and other charges.

The last three items were divided between the two pits at the end of the season.

The costs given do not include any charges for redemption of capital or for depreciation of plant.

To those familiar with hydraulic work, many variations from the method employed will probably suggest themselves. Some of the obvious ones were tried, but a return to the original plan always resulted. Although there is no intention to convey the idea that the method employed would be the most economical under any other conditions, it is thought by those in charge of the work that the costs given above could not have been equalled by any other method in this particular case.

The Anaconda Exhibit

By E. S. BARDWELL

This exhibit of the Anaconda Copper Mining Co., Montana, occupies 3500 sq. ft. in the Palace of Mines and Metallurgy. The centre of the space is occupied by a booth finished in ornamental copper trim; it serves as an office and rest-room. The entire space is surrounded by an ornamental copper railing.

The exhibit has been so planned as to take the visitor step by step through the various processes that the ore undergoes from the time it is taken from the mine until the finished wire-bar, cake, or ingot copper is shipped to the consumer.

As the visitor enters he is first shown something of the geology of the Butte district. Geological notes as taken underground in one of the large mines, together with the plan-maps of each level, vertical sections taken through the mine at different points, and a glass model serve to illustrate the manner in which the geological department controls development work in the mine. Sample recommendation sheets as issued by this department are shown. By reference to the maps and the model, the result of the advice of the geologist may be traced. The Nipper and Ballaklava models are introduced at this point as showing typical vein and skeleton models.

The association of minerals in the Butte ores is illustrated by large specimens that have been carefully selected. Instead of giving the analysis of each specimen, blocks have been placed on each table showing the metallic content of the specimen that occupies that particular table. A single block of coal weighing 3½ tons from the Washoe mine of the Anaconda company occupies a place in this part of the exhibit.

Mining methods are illustrated by means of models. That of the Leonard stopes gives a splendid idea of the tremendous amount of timber required in a large mine. There are also models illustrating the timbering of shaft and pump-stations, and a model of a typical stope-floor showing framing, chute, and manway. A paper model of the new Leonard steel head-frame, the largest of its kind in the world, is also shown. Large framed photographs of the Butte district, of surface plants and of underground workings, assist the visitor who is not entirely familiar with mining to get an idea of actual conditions in the district.

The wet concentration of ores is shown by means of products in display-bottles, with photographs showing concentrating machinery in operation. Models of the round-table plant and also of the new leaching plant at Anaconda are exhibited.

Smelting practice is explained by photographs illustrating various stages of the process and by-products in display-bottles. The result of the treatment of second-class ore by concentration and smelting is shown in a model consisting of superimposed cubical cases containing one ton of ore, the concentrate from this amount of ore, the matte, and finally, on top, a block of copper. Refractory materials manufactured by the Anaconda company are exhibited, as well as arsenic, which is an important by-product of the operations.

The activities of the International Smelting & Refining Co. are illustrated by means of products in large display-jars, and framed photographs showing portions of the company's plant at Tooele, Utah. A typical blast-furnace charge, with the various constituents of which it is composed, is also shown.
